"Under these circumstances, a patient and persevering monk suggested a mode of completely unrolling the paper. He made some attempts, which occupied a considerable portion of time, but in which by degrees he was successful. He goes on with his tedious labour, and in the same manner gradually and slowly succeeds. His plan is this. Having found the beginning of the manuscript, he fastens to the exterior edge some threads of silk, which he winds round so many pegs, inserted in a small frame. These pegs he turns with the utmost precaution, and the manuscript is imperceptibly unrolled. Little is to be expected from the first few layers of the paper, which in general are either torn or decayed. Before any pages of a work can be obtained, the manuscript must be unrolled to a certain depth, that is, till the part appears which had suffered no other injury than that of being calcined. When a few columns have been thus unrolled, they are cut off, and pasted on linen. For unfolding one of these manuscripts several months are requisite, and hitherto nothing has been obtained but the last thirty-eight columns of a Greek work against music. Two other columns or pages are also shown of two Greek manuscripts that were cut to pieces before the method of unrolling them was discovered. Each appears to have been part of a philosophical dissertation."

In some letters from the secretary of the French embassy at Naples, subjoined by M. de St Croix, and dated 1785, 1786, and 1787, it is asserted, that of about fifteen hundred or eighteen hundred manuscripts which had been discovered, two hundred or more had been destroyed by a charlatan who undertook to restore them with the assistance of some chemical application. It is also stated as highly probable that many thousands of similar manuscripts may still exist in different parts of the ruins; a conjecture so much the more interesting, as the greater number of the rolls hitherto found "have been so crushed that it will never be possible to open them, and several have been injured by the barbarous attempt to separate the leaves with a knife."

The work of Philodemus was published at Naples in 1793, as the first volume of the *Herculanensium Voluminum quæ supersunt.* The manuscript is faithfully delineated in copperplates, and the restored readings and translation are printed on the opposite page, followed by an elaborate commentary. The academicians of Portici are the professed editors. The title at the end stands thus, the work being the fourth book only of the essay.

ΜΗΝΑΝΔЄΟΝΤΩϹΟ ΧΑΡΙΝ
ΜЄΝΠΙΘΑΝΟΤ ΤΟϹΑΥΤΩΝ

The subsequent volumes of the series are little known in this country. But a part of another manuscript was inserted in the *Herculanensia* of Sir W. Drummond and Mr R. Walpole, London, 1810, in 4to; together with a very favourable report of the progress of the operations, which had been continued at the expense of the British government.

"Many obstacles," say the authors in their dedication, "opposed themselves to the accomplishment of this noble design, which address and perseverance could alone remove. The difficulty of opening the rolls of papyrus, which had been reduced to perfect carbo, can scarcely be conceived by those who have not witnessed the process. Much time and many hands were required in carrying it on; and the expense incurred was proportionate to the labour. When the manuscripts were unrolled, it was necessary that persons competent to the task should decipher and transcribe them; distribute the (capital) letters into the words to which they belonged; and supply those deficiencies in the text which but too frequently occurred. At the head of the directors of this difficult undertaking were Rosini, the editor of Philodemus; an English gentleman (Mr Hayter) sent out for the purpose; and, we believe, a Neapolitan priest, supposed to be deeply conversant in ancient literature. It was not until large sums had been expended by your royal highness, and the success of the execution had justified the boldness of the plan, that pecuniary assistance was requested and obtained from parliament. Attentive as the people of this country are, and ought to be, to the expenditure of the public money, they must glory in having contributed towards a work which does honour to the English name."

Again, in the preface, "The first papyrus which was opened contained a treatise upon music by Philodemus the Epicurean. It was in vain that Mazzocchi and Rosini wrote their learned comments on this dull performance. The sedative was too strong; and the curiosity, which had been so hastily awakened, was as quickly lulled to repose. A few men of letters indeed lamented that no further search was made for some happier subject on which learned industry might be employed; but the time, the difficulty, and the expense, which such an enterprise required, and the uncertainty of producing any thing valuable, had apparently discouraged and disgusted the academicians of Portici.

"Things were in this state when the Prince of Wales proposed to the Neapolitan government to defray the expenses of unrolling, deciphering, and publishing the manuscripts. This offer was accepted by the court of Naples; and it was consequently judged necessary by his royal highness to select a proper person to superintend the undertaking. The reputation of Mr Hayter as a classical scholar justified his appointment to the place, which the munificence of the prince, and his taste for literature, had created. This gentleman arrived at Naples in the beginning of the year 1802, and was nominated one of the directors for the development of the manuscripts.

"During a period of several years the workmen continued to open a great number of the papyri. Many, indeed, of these frail substances were destroyed, and had crumbled into dust, under the slightest touch of the operator.

"When the French invaded the kingdom of Naples in the year 1806, Mr Hayter was compelled to retire to Sicily. It is certainly to be deeply regretted that all the papyri were left behind. The writer of this preface only knows, with certainty, that when he arrived at Palermo in 1806, on his second mission to his Sicilian majesty, he found that all the papyri had been left at Naples, and that the copies of those which had been unrolled were in the possession of the Sicilian government. How this happened it would be now fruitless to inquire. The English minister made several applications to the court of Palermo to have the copies restored, but without success, until the month of August 1807. It was pretended that, according to the original agreement, the manuscripts should be published in the place where his Sicilian majesty resided; that several Neapolitans had assisted in correcting, supplying, and translating them; that his Sicilian majesty had never resigned his right to the possession, either of the originals or of the copies; and that, as a proof of this right being fully recognised, the copies had been deposited by Mr Hayter himself in the Royal Museum at Palermo. It was, however, finally agreed that the manuscripts should be given up, *pro tempore*, to Mr Drummond, who immediately replaced them in the hands of Mr Hayter. In the space of about a year, during which period they remained in the possession of the latter, a fac simile of part of one of the copies was engraved, and some different forms of Greek characters, as found in these fragments, were printed under his direction.

"From some circumstances which took place in the summer of 1808, and to which we have no pleasure in alluding, a new arrangement became indispensable. Mr Drummond proposed to the Sicilian government that the copies should be sent to London, where they might be published with advantages which could not be obtained at Palermo. His proposal was acceded to, and they have been accordingly transmitted to England. The manner in which their publication will be conducted will, of course, depend upon the determination of his Royal Highness the Prince of Wales, in whose hands they have been deposited; but it may be presumed that the republic of letters will not have to lament that these interesting fragments are to be brought to light under the auspices of a prince, who has always shown himself to be the protector of learning and the arts. We venture not to assert, but we believe, that the manuscripts will be submitted to the inspection of a select number of learned men, and will be edited under their care, and with their annotations and translations."

Mr Walpole informs us in a subsequent article, dated at Palermo, 1807, that the whole of the manuscripts which were then in Sir W. Drummond's house, amounting to more than eighty, were Greek, with the exception of one fragment of a Latin poem, which is said to have been a description of the battle of Actium and its consequences, and which has been conjectured by some critics to be the work of the Varius well known by name as the friend of Horace. One of the eighty has appeared in the *Herculanensia;* but where are the seventy-nine? The whole of the manuscripts were reported to have been presented to the university of Oxford. Has a new volcano, throwing out darkness and ashes, overwhelmed them on the banks of the Isis? Or were they, notwithstanding all the labour and expense of obtaining them, found too imperfect to deserve publication? It seems, indeed, not improbable, that the persons employed to unroll them in the first instance, who were paid in proportion to the number of pages they obtained, were too strongly tempted to sacrifice such parts of the manuscript as would have required the most labour, for the more profitable object of proceeding with a portion which would allow them to earn the most pay with the least loss of time, and that some irreparable injuries have been done to the manuscripts from these interested motives. Some pages, however, of the copies were certainly very little impaired, and these must at least deserve to be preserved from further accidents, by printing and publishing them in the simplest form possible.

It was well known, that at the time of the first arrangement between the two courts respecting these operations, the king of Naples sent six of the rolls unopened, as a present to the Prince of Wales; nor were the antiquaries and philosophers of Great Britain inattentive to this latent treasure. Several experiments were made at Carlton House, in imitation of the processes which were said to have been successful in Italy; and at last two of the manuscripts were intrusted to the care of an individual, who is supposed to have given an account of his own further attempts, in the fifth number of the *Quarterly Review.*

"At first," he informs us, "as it often happens in such cases, he appeared to be very confident of ultimate success; but difficulties afterwards occurred, and he did not continue his experiments long enough to overcome them, or even very materially to lessen them; his professional engagements interfered, much of his time had already been sacrificed, and the intelligence that Sir W. Drummond had succeeded in obtaining possession of the whole collection of the works which had been unrolled, made his own attempts appear comparatively too insignificant to deserve immediate prosecution."

"One mode of treating the papyri occurred, however, to this gentleman, which appeared to him to promise a decided advantage to such as might hereafter proceed in the operation. This was the employment of the anatomical blowpipe, an instrument which he had many years before been in the habit of using for delicate purposes, in the place of a dissecting knife. The blowpipe served him . . for a knife and a forceps; for the gum, the goldbeater's skin, and the threads of the Italians. No instrument can be so soft in its pressure as the air, for holding a thin fragment by suction, without danger of injuring it; no edge nor point can be so sharp as to be capable of insinuating itself into all the crevices which the air freely enters. But the humidity of the breath he found to add much to the utility of the instrument. The slight degree of moisture communicated to the under or inner surface of a fold made it curl up and separate from the parts beneath, where the adhesion was not too strong; while dry air from a bladder was perfectly incapable of detaching it. But the process of separating every leaf in this manner was always tedious and laborious where there was much adhesion, and sometimes altogether impracticable. Chemical agents of all kinds he tried without the least advantage; and even maceration for six months in water was unable to weaken the adhesion. It is remarkable that the characters were not effaced by this operation; so that the gum which had fixed them on the paper must have wholly lost its solubility, and the rest of its original properties.

"It has indeed been supposed by some travellers that the manuscripts were in reality never charred, the ashes thrown out by the volcano having been probably incapable of communicating to them a sufficient degree of heat for producing this effect. In fact, it is said that some of the spices found in an embalmed body retained a considerable portion of their aromatic smell. But there is no doubt whatever that the papyri are now complete charcoal, such as is formed by heat only. A small fragment of their substance burns readily, like common charcoal, with a creeping combustion, *without flame*, and with a slight vegetable smell; fresh papyrus burns with a bright flame; and almost all mineral coal, which may possibly have been formed from vegetable substances, without the operation of heat, flames abundantly. *Bovey coal*, for example, which retains much of the appearance of wood, exhibits a *considerable flame*. It is highly probable that many of the adhesions have been formed by the oily and smoky vapours distilled off from the hottest parts, and irregularly condensed in the colder; and, so far as this conjecture may be true, it would perhaps be advisable to try the effects of a *longer maceration* in alcohol and in *ether* than has hitherto been employed. The 'spear of Achilles' might also be applied with very reasonable hopes of success. A repetition of the exposure to heat, kept up more equably and more powerfully, might very probably expel the adhesive substances, without injuring the texture of the charcoal; proper care being taken to preclude completely the access both of air and of water, which might be done first by means of the air pump, and then by the insertion of a little potassium, together with the roll, in a vessel hermetically sealed. But the adhesions appear sometimes to be of a mere mechanical nature, being derived from the irregular folds into which the manuscripts have been pressed, or from some roughness of the contiguous surfaces." (P. 18, 20.)

Mr Hayter thought it necessary to reply to some of the criticisms contained in this article, and published a pamphlet entitled *Observations upon a Review of the Herculanensia*, London, 1810, in 4to, strenuously maintaining that the quotation from the *comedy* of Timocles, already extant in Athenæus, ought to be a hexameter, and not an iambic; and seeming almost to believe that Pluto, and not Plato, is the author of the fanciful etymology of the name of Juno, though the passage quoted happens to be found in Plato's *Cratylus*. It is difficult to understand by what test the merits of such a scholar were appreciated, when he was appointed to superintend the operations at Portici.

The next era of our national exertions exhibits, however, a still more striking example of good nature and facility. Dr Sickler of Hildburghausen, who had been in Italy as a private tutor, succeeded in convincing a committee of the Royal Society of Göttingen that he had unrolled a fragment of papyrus, of which he exhibited a specimen. There was no evidence that the particular manuscript, on which the experiment was said to have been performed, had presented any considerable difficulty; and it was well known that some of the pages had been read before with comparative ease. It happened, however, that the page in question bore the intrinsic marks of a gross fraud. At first sight it read like perfectly good Greek; and it had all the genuine rust of antiquity about it; but upon examination it was found to contain a blunder which no Greek writer, nor any Greek librarian, could ever have committed; for the name of a serpent is made feminine, whilst in all ancient authors it is uniformly masculine; and the general air of authenticity was easily understood, when it was found that it was copied, with little variation, from detached passages of Diodorus Siculus, and principally from the fabulous account of the voyage of Jambulus to Ceylon and beyond it. In the mean time a negotiation with Dr Sickler had been commenced; an account of it was published, with the specimen in question, under the title of *Herculaneum Rolls*. (*Correspondence relative to a Proposition made by Dr Sickler*, London, 1817, in 4to.) The parties thought themselves too far engaged to retract; nor had they the patience to wait for the result of a preliminary experiment upon a portion of a roll, which had been weighed in London, and sent, carefully packed, to Hildburghausen, in order that the surface developed might be accurately compared with the weight; and Dr Sickler was brought to London with his family for the more effectual prosecution of his operations, which in a few months were so successful as to ruin twelve chosen specimens which had been sent over as a second present to the Prince of Wales, with the exception, however, of a few fragments, which were left sufficiently entire to be made the subject of some subsequent experiments of a chemical nature.

This mischievous farce was at last terminated by a Report of the Committee appointed to superintend the Experiments of Dr Sickler, ordered by the House of Commons to be printed, in March 1818; the committee stating, in conclusion, that Dr Sickler had totally failed in his endeavours to satisfy them that his method was practicable; and annexing an account of the expenditure, of something more than L.1100, in the purchase of this total failure.

But one advantage, and that not an unimportant one, was derived from this investigation. Sir Humphry Davy had been appointed one of the superintending committee; and his studies having recently been directed to the different states of carbonic substances, in the course of his patriotic and benevolent researches into the means of preventing explosions in coal mines, he was the more naturally led to consider by what agents these apparently carbonized substances might be capable of modification. The whole detail of the process which he invented has never been made public, in order that it might not be abused by any unprincipled projector; but there is reason to think that it bears considerable analogy to the maceration in ether, which had been tried unsuccessfully, but still recommended as deserving further examination, by a less fortunate operator. A very interesting report of Sir H. Davy on the state of the manuscripts was published in the *Journal of the Royal Institution* for April 1819.

"My experiments soon convinced me," says Sir Humphry, "that the nature of these manuscripts had been generally misunderstood; that they had not, as is usually supposed, been carbonized by the operation of fire, and that they were in a state analogous to peat or *Bovey coal*, the leaves being generally cemented into one mass by a peculiar substance, which had formed during the fermentation and chemical change of the vegetable matter comprising them, in a long course of ages. The nature of this substance being known, the destruction of it became a subject of obvious chemical investigation; and I was fortunate enough to find means of accomplishing this without injuring the characters or destroying the texture of the manuscripts.

"After the chemical operation, the leaves of most of the fragments perfectly separated from each other, and the Greek characters were in a high degree distinct; but two fragments were found in peculiar states; the leaves of one easily separated, but the characters were found wholly defaced on the exterior folds, and partially defaced on the interior. In the other the characters were legible on such leaves as separated, but an earthy matter, or a species of tufa, prevented the separation in some of the parts; and both these circumstances were clearly the results of agencies to which the manuscripts had been exposed, during or after the volcanic eruption by which they had been covered.

"It appeared probable from these facts that different manuscripts might be in other states, and that one process might not apply to all of them; but even a partial success was a step gained, and my results made me anxious to examine in detail the numerous specimens preserved in the museum at Naples. Having had the honour of showing some of my results to the Prince Regent, his royal highness was graciously pleased to express his desire that I should proceed in my undertaking; and I found, on my arrival at Naples, that a letter from his royal highness to the king, and a communication made from the right honourable the secretary of state for foreign affairs to the Neapolitan government, had prepared the way for my inquiries, and procured for me the necessary result of such patronage, every possible facility in the pursuit of my objects.

"An examination of the excavations that still remain open at Herculaneum immediately confirmed the opinion which I entertained, that the manuscripts had not been acted on by the fire. These excavations are on a loose tufa, composed of volcanic ashes, sand, and fragments of lava, imperfectly cemented by ferruginous and calcareous matter. The theatre, and the buildings in the neighbourhood, are encased in this tufa; and, from the manner in which it is deposited in the galleries of the houses, there can be little doubt that it was the result of torrents laden with sand and volcanic matter, and descending at the same time with showers of ashes and stones, still more copious than those that covered Pompeii. The excavation in the house, in which the manuscripts were found, as I was informed by Monsign. Rosini, has been filled up; but a building, which is said by the guides to be this house, and which, as is evident from the engraved plan, must have been close to it, and part of the same chain of buildings, offered me the most decided proofs that the parts nearest the surface, and, *a fortiori*, those more remote, had never been exposed to any considerable degree of heat. I found a small fragment of the ceiling of one of the rooms, containing lines of gold leaf and vermilion in an unaltered state, which could not have happened if they had been acted upon by any temperature sufficient to convert vegetable matter into charcoal.

"The state of the manuscripts exactly coincides with this view; they were probably on shelves of wood, which were broken down when the roofs of the houses yielded to the weight of the superincumbent mass; hence many of them were crushed and folded in a moist state, and the leaves of some pressed together in a perpendicular direction, and all of them mixed in two confused heaps; in these heaps the exterior manuscripts, and the exterior part of the manuscripts, must have been acted on by the water; and as the ancient ink was composed of finely divided charcoal suspended in a solution of glue or gum, wherever the water percolated continuously, the characters were more or less erased.

"Moisture, by its action upon vegetable matter, produces decomposition, which may be seen in peat bogs in all its different stages: when air and water are conjunctly on leaves or small vegetable fibres, they soon become brown, then black, and by long continued operation of air, even at common temperatures, the charcoal itself is destroyed, and nothing remains but the earths which entered into the construction of the vegetable substance. When vegetable matter is not exposed to moisture or air, its decay is much slower; but in the course of ages its elements gradually re-act on each other, the volatile principles separate, and the carbonaceous matter remains.

"Of the manuscripts, the greater number (those which probably were least exposed to moisture or air, for, till the tufa consolidated, air must have penetrated through it) are brown, and still contain some of their volatile substance, or extractive matter, which occasions the coherence of the leaves; others are almost entirely converted into charcoal, and in these, when the form is adapted to the purpose, the layers may be readily separated from each other by mechanical means. Of a few, particularly the superficial parts, and which probably were most exposed to air and water, little remains except the earthy basis; the charcoal of the characters, and some of that of the vegetable matter, being destroyed; and they are in a condition approaching to that of the manuscripts found at Pompeii, where the air, constantly penetrating through the loose ashes, there being no barrier against it as in the consolidated tufa of Herculaneum, has entirely destroyed all the carbonaceous parts of the papyrus, and left nothing but earthy matter. Four or five specimens that I examined were heavy and dense, like the fragment to which I referred in the introduction to this report, a considerable quantity of foreign earthy matter being found between the leaves, and amongst the pores of the carbonaceous substance of the manuscripts, evidently deposited during the operation of the cause which consolidated the tufa.

"The number of manuscripts and of fragments originally brought to the museum, as I was informed by M. Ant. Scotti, amounted to 1696; of these, eighty-eight have been unrolled, and found in a legible state; 319 more have been operated upon, and more or less unrolled, and found not to be legible; twenty-four have been presented to foreign potentates. Amongst the 1265 that remain, and which I have examined with attention, by far the greater number consists of small fragments, or of mutilated or crushed manuscripts, in which the folds are so irregular as to offer little hopes of separating them so as to form connected leaves; from eighty to a hundred and twenty are in a state which presents a great probability of success; and of these, the greater number are of the kind in which some volatile vegetable matter remains, and to which the chemical process referred to in the beginning of this report may be applied with the greatest hopes of useful results.

"The persons charged with the business of unrolling the manuscripts in the museum informed me that many chemical experiments had been performed upon the manuscripts at different times, which assisted the separation of the leaves, but always destroyed the characters. To prove that this was not the case with my method, I made two experiments before them; one on a brown fragment of a Greek manuscript, and the other on a similar fragment of a Latin manuscript, in which the leaves were closely adherent; in both instances the separation of the layers was complete, and the characters appeared to the persons who examined them more perfect than before.

"It cannot be doubted that the 407 papyri which have been more or less unrolled were selected as the best fitted for attempts, and were probably the most perfect; so that amongst the 100 or 120 which remain in a fit state for trials, even allowing a superiority of method, it is not reasonable to expect that a much larger proportion will be legible. Of the eighty-eight manuscripts containing characters, with the exception of a few fragments, in which some lines of Latin poetry have been found, the great body consists of works of Greek philosophers or sophists; nine are of Epicurus; thirty-two bear the name of Philodemus; three of Demetrius, and one of each of these authors, Colotes, Polystratus, Carneades, and Chrysippus; and the subjects of these works, and the works of which the names of the authors are unknown, are either *natural* or *moral philosophy*, *medicine*, *criticism*, and general observations on the *arts*, *life*, and *manners*."

The opinion of Sir Humphry Davy, and that of the anonymous operator, with respect to the state of the manuscripts, are so inconsistent with each other, that the decision between them seems almost reduced to the comparison of the credibility of opposite testimonies. According to the article in the *Quarterly Review*, "there is no doubt whatever that the papyri are now complete charcoal, such as is formed by heat only; a small fragment of their substance burns readily, like common charcoal, with a creeping combustion, without flame, and with a slight vegetable smell; Bovey coal exhibits a considerable flame." On the other hand, Sir Humphry's experiments convinced him that the manuscripts were "in a state analogous to a peat, or Bovey coal;" and he inferred, from his examination of the surrounding objects, that they could not have been acted upon "by any temperature sufficient to convert vegetable matter into charcoal." Now it seems natural to prefer, on such an occasion, the authority which stands the highest with respect to the department of science in question, especially when one of the parties is unknown. But in the present instance some additional evidence may not be thought superfluous; and in fact a portion of one of the rolls, which had been examined both by Sir Humphry and by the earlier experimenter, was submitted to a new analysis, by a chemist well known for the minute accuracy of his investigations, and the solidity of his conclusions. He exposed the carbonaceous matter to the process of destructive distillation, and he could obtain nothing whatever from it like asphaltum or any other product of mineral coal. It had scarcely enough of volatile matter to give any perceptible tinge of brown to the humidity absorbed by the substance, but enough to afford an animal smell, extremely like that of burnt bone, which he could only attribute to the glue or size of the ink not being completely decomposed by the same heat which had expelled all the volatile parts of vegetable origin; and upon exposing some glue, spread on paper, to the heat of boiling quicksilver, he obtained a partial carbonization, which he conceived to be perfectly analogous to that of the manuscripts; the substance thus formed affording, when exposed to a stronger heat, very copious vapours of an empyreumatic oil, though the products of the vegetable matter were probably expelled by the heat first applied. On the other hand, the heat of boiling quicksilver did not produce the animal smell from the papyrus. Hence he judged that the precise temperature of the overwhelming mass might be ascertained with tolerable accuracy; and he was persuaded that nothing but a heat approaching to 600° of Fahrenheit could have reduced the roll which he examined to the state in which he found it. At any rate, when we consider that a heat a little above 220° is capable of blackening, when applied for a long continuance, the wood that surrounds the boiler of a steam engine, it seems very difficult to agree with Sir Humphry Davy in thinking that the manuscript could not have been subjected to "any heat capable of converting vegetable matter into charcoal," unless by charcoal he understands pure carbon; and in this sense his observation will readily be admitted by all parties. It seems, indeed, to have been precisely with this conception of the state of the manuscripts, that it was suggested by the *Quarterly Reviewer* that some benefit might be expected from submitting the rolls to a heat more intense than that which they appeared to have undergone. The experiment, however, was subsequently performed with considerable care; but it failed completely of success. A fragment of a roll, consisting of several thicknesses, adhering together, was enclosed in a crucible, surrounded by charcoal powder, and kept for some time in a red heat; but no perceptible alteration took place in the state of the fragment, the adhesions were in no degree detached, nor was the legibility of the characters on the surface impaired.

After the failure of this experiment, in order to leave no mechanical means untried, a cutting machine was contrived, consisting of a very thin circular plate made into a fine saw, and put in rapid motion by wheel-work. This apparatus was found perfectly capable of dividing the substance of the roll without splintering it, as knives had been found to do; and it was hoped that, by cutting it across wherever there was a considerable fold, it would be possible to extricate many parts from each other, which were only retained in contact by this accidental complication of form; and that having the advantage of beginning from within, it would be easier to work down upon the successive surfaces bearing the letters, the writing being always found on the inside only; and no material difficulty was apprehended in reuniting the several parts, when they should once have been rendered legible. It was also recollected that the interior parts of the manuscript had in general been the least crushed and the least adherent; and it was hoped that a part at least of each manuscript might thus be rendered legible with ease, and at the same time without destroying the parts remaining unopened. But the interior parts of the roll which had been thus divided were found as adherent as the exterior, and the adhesions still remained everywhere invincible; so that all hopes of succeeding by mechanical means only were finally abandoned. The machine was afterwards sent to Naples, as it was thought likely to be of use in some of the operations that Sir Humphry Davy's process would require; but it is said not to have been found necessary for this purpose.

With regard to Sir Humphry's observation that vegetable matter not exposed to moisture or air undergoes a much slower decay, but that in the course of ages "its elements gradually re-act on each other, the volatile principles separate, and the carbonaceous matter remains," it may be remarked that the rolls of papyrus do not seem to undergo any change of this nature in the course of twenty or thirty centuries; for the Egyptian volumes, which are often found enclosed within the bandages of mummies, are generally so free from decay, that the paper has retained its primitive whiteness, without much alteration, except sometimes a slight tinge of brown; and its texture is so little impaired that it still bears ink well without running. When, however, a roll has been in any degree pervaded by moisture, the water is found to have dissolved the gum which unites the elementary leaves of the plant, and to have caused partial adhesions of the contiguous surfaces of the sheets to each other.

Whatever difference of opinion there may be respecting the reasoning upon which Sir Humphry Davy appears to have grounded his processes, there can be no doubt that they have actually been employed with considerable advantage. Mr Burton was encouraged by the British government to undertake the manipulation of the chemical operations which were required; and Mr Elmsley was requested to prolong his stay in Italy, and to become the superintendent of the literary department. Sir Humphry appears to have been well satisfied with his success, and a great variety of manuscripts have been rendered more or less legible; but their contents have proved of little more importance than might have been expected from the nature of the specimens before examined. Sir Humphry is of opinion, however, that an acquaintance with the contents of the remainder of the collection would afford much curious and useful information respecting the state of society, literature, science, and the arts, particularly in the Greek colonies of Magna Græcia and Sicily, which were at one time the rivals of the mother country in civilization and glory. It is highly probable, indeed, that many of the works in the collection at Herculaneum were composed by natives of Magna Græcia; in a collection made in that country such works would not be neglected; and in cities like Tarentum, Crotona, Pompeii, and others, the advanced state of civilization necessarily implied activity, both in literature and in science. The schools of Pythagoras and Archytas alone must have furnished numerous works, the recovery of some of which, nay even of fragments thereof, would unquestionably be an object of equal interest and importance.

With regard to the restoration of the mutilated manuscripts, if this delicate and difficult task had been intrusted to scholars like Mr Elmsley, it would have been executed in a much more satisfactory manner, and we should have met with none of those errors which have disgraced some of the former restorers of the Greek text; for, in fact, even the work of Philodemus on Music, which is commonly supposed to have been well edited, exhibits some singular instances of a want of familiarity with the idiom of the language, and of a critical knowledge of its rules. In the thirty-eighth and last column, which was cursorily examined, for the purpose of selecting a specimen of the characters only, a passage occurs which is thus read and translated by the academicians of Portici. Τοσαυτα τοινυν ἐιρηκως, προς ἁ τινες ἐγκεχειρηκασι, δια τ' ἐιναι μην ἀν δεοντως, ὁτι χαριν μεν πιθανοτητος ἀυτων ὀυδε πολλοστημοριον ὠφειλον εκτεινειν. *Tot igitur tantaque disserui adversus ea quæ aliqui tractarunt*, propterea quia opportunum fortasse erat. *Namque profecto propter ipsorum suadelam ne minima quidem parte debebam me extendere.* It is scarcely necessary to point out to any Greek scholar, that the true reading must be διατειναιμην ἀν δεοντως. "Having said thus much, *I may probably have been sufficiently diffuse* in replying to the arguments of some persons;" but "that, in proportion to the plausibility of these arguments, I ought not to have extended my discussion beyond a very small part of its actual magnitude."

Such mistakes, however, can do but little injury to the mutilated authors, provided that the original be preserved at the same time in its unaltered state. But that original, in its authentic though imperfect form, is the only object of comparative value; and to delay its publication for the sake of restorations of any kind, seems to be but a refined species of selfishness. "When we reflect," says the *Quarterly Reviewer*, "on the shortness of human life, and on our own grey hairs, we tremble to think how little chance there is of our being benefited by any great proportion of the EIGHTY manuscripts still unpublished." Many years have now elapsed since these reflections were printed, and not a line of the manuscripts in question has yet made its way to that public which had so equitable a claim to a full communication of their contents.

It must not, however, be denied, that to the great majority of readers it would be far more agreeable and convenient to have the works not only restored, but translated, if it could be done with tolerable accuracy, and without any very great loss of time. And even where a *probable* restoration is beyond our reach, it might be of some advantage to substitute a *possible* one. Thus the specimen which has been copied from the *Philosophical Transactions* for 1752 might suggest the three hexameters,

ALTER.IN.ALTERIUS.DULCI.AMPLEXU.
MORITURUS.
NON.EQUIDEM.CURIS.CRUDELIA.FATA.MOVERI.
POSSE.REOR.NEC.ME.VITAE.SPES.VANA.FEFELLIT.

Lines which are not indeed very harmonious or poetical, but which *might* have stood in the same work with

CONSILIIS.NOX.APTA.DUCUM.LUX.APTIOR.ARMIS,

and with Cleopatra's

TRAHITURQUE.LIBIDINE.MORTIS,

which are almost the only specimens that we possess of the poem attributed to Varius. If several independent attempts of this kind were made by different critics, the presumption in favour of those restorations, which were found to be common to all, would be raised from a mere possibility to a strong probability; but whether the same expense of labour and talents, directed into some other channel, might not create original works of still greater value, is a question not easy to be decided.

Signor Rosini, the president of the Bourbon Society of Antiquaries, published, in 1788, the first volume of those manuscripts which had been found at Herculaneum, under the title of *Herculanensium Voluminum quæ supersunt;* a volume which, as we have already mentioned, contains the first book of Philodemus on Music. The second volume was published in 1809, and, besides the preliminary dissertation, which had originally appeared in 1797, furnished only some small fragments of Epicurus. But soon after the return of Ferdinand to Sicily in 1815, there was founded the Royal Bourbon Society, which is divided into three academies, viz. the academy of archæology, that of the sciences, and that of the fine arts. Two academicians, Savaroni and Geterino, were intrusted with the labours relative to the manuscripts found in the excavations of Herculaneum; and, in the third volume of the *Herculanensia*, which appeared at Naples in 1827, they commented on two other productions of Philodemus, the publication of which had been confided to the care of Signor Rosini. The first of these is entitled Φιλοδημου περι κακιων και των αντικειμενων ἀρετων και των ἐν ὁις ἐισι και περι ἁ, *Philodemi de Vitiis et Virtutibus appositis et de rerum subjectis et objectis.* In this work the author treats of domestic economy, and shows how a good father of a family ought to govern his household, if he wishes to avoid faults, and to practise the virtues which are opposed to them. The second production is entitled Φιλοδημου περι κακιων, *Philodemi de Vitiis.* In this writing the author treats of particular defects, at the same time indicating the virtues which are opposed to them. Speaking of pride, for example, he characterises its different species, with the manifestations and inconveniences of each, and the antidotes to be applied; and of the proud he enumerates eight classes, viz. ὑπεροπται, ἀυθαδεις, ἀλαζονες, ἀυθεκαστοι, παντειδημονὲς, σεμνοκοποι ἠ βρενθυομενοι, ἐυτελισται, and ουδενωπαι; whilst Theophrastus, on the contrary, admits only three classes. This writing of Philodemus will enrich the Greek vocabularies. It is unfortunately full of *lacunæ;* but in the preface, the editor, Aloisio Catcrino, has indicated the probable import of the passages which are wanting. In 1824, the university of Oxford published two volumes entitled *Herculanensium Voluminum partes duæ*, containing four fragments lithographed from the papyri, without note, commentary, or any attempt to correct the text or supply *lacunæ*. Two of these fragments are the essays of Philodemus already mentioned; and the fourth is a fragment of a work on rhetoric by Demetrius; but, from the negligent manner in which they have been edited, the publication is of comparatively little value. The *Herculanensium Voluminum quæ supersunt tomus* iii. however, has been brought out with greater care, and in a much more creditable manner. "Chaque page est gravée sur cuivre; à côte se trouve l'impression en caractères ordinaires, et les complémens de lettres ou de mots en couleur rouge; vient ensuite la traduction Latine, qui est presque toujours littérale; à la fin il y a quatre tables contenant les mots Grecs peu usités, qui sont expliquées dans les notes, les auteurs et les personnes que Philodemus a cités; en fin, les objets qui présentent quelque importance." Prefixed to the Oxford work is a catalogue of papyri, ninety-five in number, presented to the university by his majesty; but we do not observe in it any thing which seems calculated to increase the regret of the learned at the difficulties met with in attempting to unfold these disinterred relics of ancient literature.

It now only remains to notice a very singular opinion expressed by Ignarra as to the epoch at which Herculaneum and Pompeii were buried under the ashes of Vesuvius. According to this savant, these cities existed long after the eruption of the year 79, nay even in the fifth century. The principal proof he produces in support of his assertion is, that their names are found in the map of Peuttinger, which, he thinks, could not have been constructed before the end of the fourth century, but that they are no longer observed in the itinerary of Antoninus, which could not have been composed previously to the year 471. Between these two epochs, therefore, must, according to Ignarra, be placed that of the destruction of these cities. But this surely is not valid reasoning. The map called Peuttinger's is probably a copy of one more ancient, made by some ignorant person, who either did not know that these cities no longer existed, or who did not venture to suppress any thing he found in the original which he copied. Besides, it is possible that the sites which Herculaneum and Pompeii occupied may have preserved the names of these cities long after their destruction. The name of Stabia still remains, although of the city not a single monument has been preserved. But whilst neither at Herculaneum nor at Pompeii has any monument, inscription, or medal been found of a date posterior to the reign of Titus, it may nevertheless be reasonably maintained that these cities were not entirely overwhelmed by the irruption which Pliny the younger has described with so much exactness and interest; and hence it is highly probable that, as Ignarra pretends, some remains of the city of Herculaneum were still to be seen in the fifth century. This is indeed placed beyond a doubt by the following verses of Sannazaro:

Rupe sub hac mecum sedit Galatea: videbam
Et Capreas, et quæ Sirenum nomina servant
Rura procul; *veteres* alia de parte *ruinas*
Herculis ambusta signabat ab arce Vesevus.

But what is it this teaches us? Nothing except that, several centuries after the calamity described by Pliny, some ruins of Herculaneum were still visible; perhaps some portico which, having been constructed upon a height in the town, had not yet been totally covered by the lava. It is no doubt from some such portico that the village of *Portici* originally derived its name. "Ce qu'il y a d'étonnant," says the editor of Count Orloff's *Mémoire sur le Royaume de Naples*, "c'est qu'ayant sous les yeux des ruines qui ne leur permettaient pas de douter que, sous le sol même, ils trouveraient Herculanum, les habitans de ce pays n'aient pas eu plus tôt le désir de fouiller; que cette ville ait été complétement oubliée, et qu'il ait fallu qu'un heureux hasard vint de nos jours seulement en révéler l'existence."

HERCULES, in fabulous history, a most renowned Grecian hero, who after his death was ranked amongst the gods, and received divine honours. According to the ancients, there were many persons of the same name. Diodorus mentions three, Cicero six, and some authors extend the number to more than forty. Of all these, one generally called the Theban Hercules is the most celebrated; and to him, as may easily be imagined, the actions of the others have been attributed. He is reported to have been the son of Jupiter by Alcmena, wife to Amphitryon, king of Argos, whom Jupiter enjoyed in the shape of her husband whilst he was absent; and, in order to add the greater strength to the child, made that amorous night as long as three. Amphitryon having soon afterwards accidentally killed his uncle and father-in-law Electryon, was obliged to fly to Thebes, where Hercules was born. The jealousy of Juno, on account of her husband's amour with Alcmena, prompted her to attempt destroying the infant. For this purpose she sent two serpents to kill him in the cradle, but the young Hercules strangled both of them. He was early instructed in the liberal arts, whilst Castor the son of Tyndarus taught him how to fight, Eurytus how to shoot with a bow and arrows, Autolycus to drive a chariot, Linus to play on the lyre, and Eumolpus to sing. Like the rest of his illustrious contemporaries, he soon afterwards became the pupil of Chiron the centaur, and under him rendered himself the most valiant and accomplished of the age. In the eighteenth year of his age he resolved to deliver the neighbourhood of Mount Cithæron from a huge lion which preyed on the flocks of Amphitryon his supposed father, and which laid waste the adjacent country. He went to the court of Thespius, king of Thespis, who, sharing in the general calamity, received him kindly, and entertained him during fifty days. The fifty daughters of the king became mothers by Hercules during his stay at Thespis, and some say that it was effected in one night. After he had destroyed the lion of Mount Cithæron, he delivered his country from the annual tribute of a hundred oxen which it paid to Erginus. Such public services became universally known; and Creon, who then sat on the throne of Thebes, rewarded the patriotic deeds of Hercules by giving him his daughter in marriage, and intrusting him with the government of his kingdom.

Eurystheus, the son of Amphitryon, having succeeded his father, soon became jealous of Hercules; and fearing lest he might be deprived of his crown, left no means untried in order to get rid of him. Of this Hercules was not insensible, because he was perpetually engaging him on some desperate expedition; and therefore went to consult the oracle. But being answered that it was the pleasure of the gods that he should serve Eurystheus twelve years, he fell into a deep melancholy, which at last ended in furious madness. Among other desperate actions which he perpetrated whilst afflicted with this disease, he put away his wife Megara, and murdered all the children he had by her. As an expiation of this crime, the king imposed upon him twelve labours surpassing the power of all other mortals to accomplish, but which nevertheless our hero performed with great ease. The favour of the gods had indeed completely armed him when he undertook his labours. He had received a coat of armour and helmet from Minerva, a sword from Mercury, a horse from Neptune, a shield from Jupiter, a bow and arrows from Apollo, and from Vulcan a golden cuirass and brazen buskin, with a celebrated club, of brass, according to the opinion of some writers.

The first labour imposed upon him was the killing a lion in Nemea, a wood of Achaia, the hide of which was proof against any weapon, so that he was forced to seize him by the throat and strangle him. He carried the dead beast on his shoulders to Mycenæ, and ever afterwards clothed himself with the skin. Eurystheus was so astonished at the sight of this beast, and at the courage of Hercules, that he ordered him never to enter the gates of the city when he returned from his expeditions, but to wait for his orders without the walls. He even made himself a brazen vessel, into which he retired whenever Hercules returned. The second labour was to destroy the Lernæan hydra, which had seven heads according to Apollodorus, fifty according to Simonides, and a hundred according to Diodorus. This celebrated monster he first attacked with his arrows; but soon afterwards he came to a close engagement, and by means of his heavy club he destroyed the heads of his enemy. This, however, was productive of no advantage; for as soon as one head was beaten to pieces by the club, two immediately sprang up; and the labour of Hercules would have remained unfinished, had he not commanded his friend Iolas to burn with a hot iron the root of the head which he had crushed to pieces. This succeeded; Hercules became victorious, and opening the belly of the monster, he dipped his arrows in the gall, to render the wounds which he inflicted incurable. He was ordered in his third labour to bring alive and unhurt into the presence of Eurystheus a stag, famous for its incredible swiftness, its golden horns, and its brazen feet. This celebrated animal frequented the neighbourhood of Œnoe; and Hercules was employed for a whole year in continually pursuing it; but at last he caught it in a trap, or when tired, or, according to others, by slightly wounding it and lessening its swiftness. The fourth labour was to bring alive to Eurystheus a wild boar which ravaged the neighbourhood of Erymanthus. In this expedition he destroyed the centaurs, and caught the boar by closely pursuing him through the deep snow. Eurystheus was so frightened at the sight of the boar, that, according to Diodorus, he hid himself for some days in his brazen vessel. In his fifth labour Hercules was ordered to clean the stables of Augeas, where three thousand oxen had been confined for many years. For his sixth labour he was enjoined to kill the carnivorous birds which ravaged the country near the lake Stymphalis in Arcadia. In his seventh labour he brought alive into Peloponnesus a prodigious wild bull, which laid waste the island of Crete. In his eighth labour he was employed in obtaining the mares of Diomedes, which fed upon human flesh. He killed Diomedes, and gave him to be eaten by his mares, which he brought to Eurystheus. They were sent to Mount Olympus by the king of Mycenæ, where they were devoured by the wild beasts; or, according to others, they were consecrated to Jupiter, and their breed still existed in the age of Alexander the Great. For his ninth labour he was commanded to obtain the girdle of the queen of the Amazons. In his tenth labour he killed the monster Geryon, king of Gades, and brought to Argos his numerous flocks, which fed upon human flesh. This was in Iberia or Spain, in the furthest parts of which he erected his two pillars, as the utmost limits of the then known world. These ten labours he achieved, as the fable says, in about eight years. In this last expedition he is likewise affirmed to have killed Antæus, a famous giant of a monstrous size, who, when weary with wrestling or labour, was immediately refreshed by touching the earth. Hercules overcame him in wrestling, and slew him; and afterwards, on his way through Egypt, the tyrant Busiris. This bloody man used to sacrifice all his guests and strangers upon his altars; and designing to have done the same by Hercules, was slain by him, together with all his attendants. His eleventh labour was the carrying away the Hesperian golden apples kept by a dragon. The last and most perilous of his labours was to bring upon earth the three-headed dog Cerberus. Descending into hell by a cave on Mount Tænarus, he was permitted by Pluto to carry away his friends Theseus and Pirithous, who were condemned to punishment in hell; and Cerberus also was granted to his prayers, provided he made use of no arms but force only to drag him away. Hercules, as some report, carried him back to hell after he had brought him before Eurystheus.

Many other exploits are said to have been performed by Hercules. In particular, he accompanied the Argonauts to Colchis before he delivered himself up to the king of Mycenæ. He assisted the gods in their wars against the giants; and it was through him alone that Jupiter obtained a victory. He conquered Laomedon, and pillaged Troy. When Iole, the daughter of Eurytus, king of Œchalia, of whom he was deeply enamoured, was refused to his entreaties, he became the victim of a second fit of insanity, and murdered Iphitus, the only one of the sons of Eurytus who favoured his addresses to Iole. He was some time afterwards purified of the murder, and his insanity ceased; but the gods persecuted him, and he was visited by a disorder which obliged him to apply to the oracle of Delphi for relief. The coldness with which the Pythia received him irritated him, and he resolved to plunder Apollo's temple and carry away the sacred tripod. Apollo opposed him, and a severe conflict began, which nothing but the interference of Jupiter with his thunderbolts could have prevented. He was upon this told by the oracle that he must be sold as a slave, and remain three years in the most abject servitude, to recover from his disorder. He complied; and Mercury, by order of Jupiter, conducted him to Omphale, queen of Lydia, to whom he was sold as a slave. Here he cleared all the country from robbers; and Omphale, who was astonished at the greatness of his exploits, married him. Hercules had Agelaus and Lamon by Omphale, from whom Crœsus king of Lydia was descended. He also became enamoured of one of Omphale's female servants, by whom he had Alceus. After he had completed the years of his slavery he returned to Peloponnesus, where he re-established on the throne of Sparta Tyndarus, who had been expelled by Hippocoon. He became one of Dejanira's suitors, and married her after he had overcome all his rivals. He was obliged to leave Calydon, his father-in-law's kingdom, because he had inadvertently killed a man with a blow of his fist; and it was on account of this expulsion that he was not present at the hunting of the Calydonian boar. From Calydon he retired to the court of Ceyx, king of Trachinia. The king received him and his wife with great marks of friendship, and purified him of the murder which he had committed at Calydon. Hercules was still mindful that he had once been refused the hand of Iole; he therefore made war against her father Eurytus, and killed him, with three of his sons. Iole fell into the hands of her father's murderer, and found that she was beloved by Hercules as much as before. She accompanied him to Mount Œta, where he was going to raise an altar and offer a solemn sacrifice to Jupiter. As he had not then the shirt and tunic in which he arrayed himself to offer a sacrifice, he sent Lichas to Trachin to his wife Dejanira, in order to provide himself a proper dress. Dejanira had some time before been attempted by the centaur Nessus, as he was ferrying her over the river Euenus; and Hercules beholding it from the shore, had given him a mortal wound with an arrow. The monster finding himself dying, advised her to mix some oil with the blood which flowed from his wound, and to anoint with it her husband's shirt, pretending that it would infallibly secure him from loving any other woman; and she, too well apprised of his inconstancy, had actually prepared the poisoned ointment accordingly. Lichas coming to her for the garments, unfortunately acquainted her with his having brought away Iole; upon which Dejanira, in a fit of jealousy, anointed his shirt with the fatal mixture. This had no sooner touched his body than he felt the poison diffuse itself through his veins; the violent pain of which caused him to disband his army, and to return to Trachin. His torment still increasing, he sent to consult the oracle for a cure; and was answered, that he should cause himself to be conveyed to Mount Œta, and there rear up a great pile of wood, and leave the rest to Jupiter. By the time he had obeyed the oracle, his pains having become intolerable, he dressed himself in his martial habit, flung himself upon the pile, and desired the bystanders to set fire to it. Others say that he left the charge of it to his son Philoctetes, who, having performed his father's command, had his bow and arrows given him as a reward for his obedience. At the same time Jupiter, to be as good as his word, sent a flash of lightning, which consumed both the pile and the hero; insomuch that Iolas, coming to take up his bones, found nothing but ashes; from which they concluded that he had passed from earth to heaven, and joined the gods. His friends showed their gratitude to his memory by raising an altar where the burning pile had stood. Menœtius the son of Actor offered him a sacrifice of a bull, a wild boar, and a goat, and enjoined the people of Opus yearly to observe the same religious ceremonies. His worship soon became as universal as his fame; and Juno, who had once persecuted him with the utmost fury, forgot her resentment, and gave him her daughter Hebe in marriage. Hercules has received many surnames and epithets, either from the place where his worship was established, or from the labours which he achieved. His temples were numerous and magnificent, and his divinity revered. No dogs or flies ever entered his temple at Rome; and that of Gades, according to Strabo, was always forbidden to women and pigs. The Phœnicians offered quails on his altars; and as it was supposed that he presided over dreams, the sick and infirm were sent to sleep in his temples, that they might receive in their dreams the agreeable presages of their approaching recovery. The white poplar was particularly dedicated to his service.

HERCULES, in *Astronomy*, one of the constellations of the northern hemisphere. The stars in the constellation Hercules in Ptolemy's catalogue are 29; in Tycho's 28; in the Britannic catalogue 113.

HERCULES's Pillars, in *Antiquity*, a name given to two lofty mountains, one situated on the most southern extremity of Spain, and the other on the opposite coast of Africa. They were called by the ancients *Abyla* and *Calpe*. They were reckoned the boundaries of the labours of Hercules; and, according to ancient tradition, they were joined together till they were severed by the arm of the hero, and a communication opened between the Mediterranean and the Atlantic.

HERCYNIA SILVA, in *Ancient Geography*, the largest of forests. Its breadth was a journey of nine days to the best traveller. Taking its rise at the limits of the Helvetii, Nemetes, and Rauraci, it extended along the Dauube to the borders of the Daci and Anartes, a length of sixty days' journey, according to Cæsar, who appears to have been well acquainted with its true breadth, seeing it occupied all Lower Germany. It may therefore be considered as covering the whole of Germany; and most of the other forests may be considered as parts of it, though distinguished by particular names; consequently the Hartz, in the duchy of Brunswick, which gave name to the whole, may be considered as one of its parts. The name *Hartz* denotes *resinous*, or *pine-trees*. By the Greeks it is called *Orcynius*, as a name common to all the forests in Germany; in the same manner as *Hercynius* was the name given by the Romans. Both are derived from the German *Hartz*.

HEREDITARY, an appellation given to whatever belongs to a family by right of succession from heir to heir.

HEREDITARY is also figuratively applied to good or ill qualities supposed to be transmitted from father to son. Thus we say virtue and piety are hereditary qualities in such a family.

HEREFORD, a city, the capital of the county of the same name, situated on the river Wye. It was built before 823, where the first church was erected, and afterwards, in 1015, converted into a cathedral. The present cathedral was begun by the second bishop, on the model of the church at Aix-la-Chapelle. The city is composed of six parishes, though there are only four churches now in existence. A part of the cathedral fell down in 1786, but has been since rebuilt. The streets are wide and clean, and the buildings generally handsome. In the market-place or square is the county hall, a good building, in which the assizes and sessions are held. As Herefordshire is the nearest English county to Wales, much legal business is brought to the city from that principality. The government of the city is in the hands of a corporate body, consisting of a mayor, six aldermen, a recorder, and a common council. Two members are returned to the House of Commons by the freemen and householders, about 1100 in number. The air of the vicinity is considered peculiarly salubrious. There are well-supplied markets on Wednesday and Saturday, at which provisions of all kinds are moderate. The inhabitants amounted in 1801 to 6828, in 1811 to 7306, in 1821 to 9090, and in 1831 to 10,280.

HEREFORDSHIRE, an inland English county, bounded on the north by Shropshire, on the east by Worcestershire, on the south by Gloucestershire and Monmouthshire, and on the west by the Welsh counties of Brecknock and Radnor. Its greatest length is thirty-eight, and its greatest breadth thirty-five miles. It is nearly of a circular form; but the dividing lines are broken by many indentations. Its circumference is 120 miles, and its square area 1221 miles, or 781,440 statute acres.

It is divided into eleven hundreds, containing one city, seven towns, and 221 parishes. The population amounted in 1801 to 89,191, in 1811 to 94,073, in 1821 to 103,243, and in 1831 to 110,300. By the comparative tables of mortality, it appears that the ratio of deaths to the whole population has been thus: From 1801 to 1811 one in fifty-seven, from 1811 to 1821 one in fifty-eight, and from 1821 to 1831 one in fifty-eight. Few manufactures exist in the county; about forty persons are employed in making hats at Leominster, and a few cloths and stockings are made in other parts. The occupations stand thus: Agriculturists employing labourers, 2505; agriculturists employing no labourers, 1679; labourers in agriculture, 12,213; employed in manufacture, 63; retail traders or handicraft, 7576; capitalists, bankers, &c. 911; labourers not agricultural, 2410; other males twenty years of age, 1521; male servants, 725; female servants, 5512.

The face of the country is very beautiful, when viewed from the western descent of the Malvern Hills. The whole country is rather thickly enclosed with high hedges; the divisions of the fields are generally small; and the abundance, both of forest and fruit trees, with which its surface is covered, gives it the appearance of an extensive wood. The roads are all narrow and bad, and even the turnpike ones are scarcely an exception.

In the eastern side of the county, a part of the Malvern Hills is rather barren, as are the Hatterel or Black Mountains, which divide it from Wales on the west. With the exception of these two portions, the whole of the land is highly fertile, and the fields are clothed with perpetual verdure. The soil is generally a mixture of marl and clay, but contains calcareous earth in various proportions in different parts. Towards the western part, the soil is tenacious, and retentive of water; the eastern side is principally a stiff clay, in some places of a red colour. In the south, some of the soil is a light sandy loam. The subsoil is almost universally limestone; in some parts a species of marble, beautifully variegated with red and white veins, and capable of receiving a high polish. Where the soil does not rest on limestone, as near the city of Hereford, it is sometimes a siliceous gravel, and occasionally fuller's earth and yellow ochres are found. The climate is rather more inclined to rain than the more eastern parts of England, and at times is much subject to damp fogs, which moisten the earth, and may be one cause of its great verdure.

The cultivation of grain is generally in a state behind most of the English counties, and the crops bear no proportion to the excellence of the soil. Wheat is generally sowed on a clover ley, with a dressing of lime, and then yields, on an average, twenty bushels to the acre. After this wheat is harvested, a winter and spring ploughing are followed by peas, which do not average more than fourteen bushels to the acre. The peas are followed by wheat again, when the produce is not usually more than fourteen bushels. In the succeeding spring it is sowed with barley and clover, neither of which crops yields a good increase. Oats are only sowed partially in the room of barley. Turnips are carelessly cultivated, and artificial grasses sowed to a very limited extent, though somewhat increased of late years. On the borders of some of the rivers there are most valuable meadows of natural grass, which are the most productive of any lands in the county.

One cause of the neglect manifested in the cultivation of corn may be the attention paid to the growth of hops and fruit. The cultivation of hops is considerable, and increasing on the borders of Worcestershire, and much more of the manure is applied to them than to the corn. The soils selected for hop gardens are those where a dry loam predominates, with but a small proportion of clay; and old pastures are deemed more fit for them than the land that has been recently under the plough. The time of planting them is usually the month of April. In July the gardens are hoed carefully, and the same operation is repeated five or six weeks after; and in September the earth is formed into hillocks around the roots of the young plants. The hops are picked from the plants in October, are then gently dried in a kiln, and packed for sale. The average produce of an acre of garden is about five hundredweight of hops. Each acre requires 1000 poles, around which the plants entwine themselves. The cost of poles, of manure, and of labour, makes the cultivation highly expensive, and in some years it far exceeds the amount of the produce, but in others the growers gain very large profits. The whole is a very speculative pursuit.

The rearing of fruit-trees, to the growth of which the soil and climate seem admirably adapted, engrosses the greatest share of the attention and skill of the Herefordshire cultivators. Although almost every soil and situation in the county is favourable to the growth of apples and pears, yet those spots are preferred which are exposed to the south-east and sheltered to the westward; as it is found that the winds from that quarter are ungenial to the fruit trees. Orchards, though planted in Kent as early as the reign of Henry VIII., did not extend to Herefordshire till they were introduced by Lord Scudamore and some other gentlemen in the reign of Charles I. when the circumstance of their adaptation to the soil being ascertained, they quickly spread over the whole county. It is a fact, that many varieties of apples and pears, which a few years ago were the most highly esteemed, have entirely disappeared; but new varieties have by care and attention been produced, which equal in value, if not in fame, the celebrated *redstreak* and *slime* apple, and the *squash* pear, the value of whose cider and perry was thirty years ago most highly prized. Some of the proprietors of orchards, who are most attentive to the selection of the fruit, and most skilful in the management of the juice when expressed, have produced such exquisitely flavoured cider and perry as to obtain for them a preference over any wines made from the grape. The prices at which the best of these liquors are sold by the growers far exceed those which are obtained for the best wines of any vineyards either in France or Germany. They are sometimes sold as high as L.20 the hogshead direct from the press. Some of the orchards are from thirty to forty acres in extent, and the trees being at considerable distance from each other, the intervals are kept in tillage. The produce of the orchards is very fluctuating, though less so in Herefordshire than in Somerset, Devon, or Gloucester; yet the growers seldom expect more than one year in three to be fully productive. In a good year an acre of orchard will produce from eighteen to twenty-four hogsheads of cider or perry. The quantity of apples or pears required to make a hogshead varies from twenty-four to thirty bushels. The greater part of the best descriptions of both liquors is purchased by merchants from Bristol, who find bottles, and export it to the East and West Indies, and to America.

Herefordshire.

Herefordshire has long been celebrated for one of the best races of cows. They are of the middle-horned kind, have a large and athletic frame, and, from the silky nature of their coats, have an unusually sleek appearance. The most prevailing colour is a reddish brown, and their faces are white and bald. The heifers fatten quickly at an early age, and the calves are highly esteemed. The rearing of oxen for the plough is a common pursuit, and the greater part of the animal labour of the county is performed by them. After being worked five or six years, they are usually sold to graziers from Buckinghamshire, and fattened in the Vale of Aylesbury for the consumption of the metropolis, where their flesh is highly prized.

The fame of the Herefordshire sheep equals that of its cows. They are best known by the name of the Rylands, a district in the southern part of the county, in which the superior varieties of them are fed. They are small, white-faced, and without horns. In symmetry of shape, and in the exquisite flavour of the meat, they surpass most other kinds; and, in addition, their wool is by far the finest produced from any of the native English races. The quantity of wool from them does not average more than two pounds each, but it is usually sold for three times the price of coarse wool. Many experiments have been made to improve this breed by crossing them with the Merinos; but it has been found that the flesh has deteriorated as much as the wool has improved by the mixture. The practice of keeping the sheep in houses in cold weather is general, and perhaps the wool may be in some degree indebted to that management for a portion of its fineness of fibre.

The excellence of the wool has not induced many manufactures, for most of it is sold to the clothiers of Gloucestershire and Somersetshire. Attempts have been made to establish manufactories of woollen goods in the city of Hereford, but they proved abortive. At Kington some few woollens are made, and likewise at Leominster, but to no great extent. The river Wye is navigable to Hereford, but either floods or droughts so often suspend the navigation, that the trade carried on by it is very inconsiderable.

The principal river, the Wye, is celebrated for its picturesque beauties, especially in the vicinity of Ross, and till it enters Monmouthshire. The other streams, the Lugg, receiving the waters of the Arrow and the Frome, the Munnow receiving those of the Dore, and the Leddon, are but inconsiderable, though they tend to fertilize the lands through which they flow.

Few counties are more rich in antiquities than Herefordshire, especially in the remains of those feudal castles, which were probably erected when it was the frontier towards the hostile Welsh. The most remarkable of these are Goodrich Castle, Dore Abbey, Wigmore Abbey, Vineyard Camp, and Bransil Castle.

The largest towns, and their population, are, Hereford, 10,280; Leominster, 5249; Ledbury, 3909; Ross, 3078; and Kington, 3111.

By the law of 1832 this county returns three members to parliament; and the polling places are Hereford, Leominster, Bromyard, Ledbury, Ross, and Kington. The borough of Weobly was disfranchised by the same law, and Hereford and Leominster return each two members.

The towns in Herefordshire are generally worse built than in any other English county, and more nearly approach to those of their adjoining Welsh neighbours. In the villages the buildings are still worse. The construction of most of the farm-houses and of the barns is rude and slight; they are usually built of stone, only cemented with mud or clay, about two feet high; and upon these imperfect walls the superstructure is raised, composed of timber frame-work, with laths intertwined, and plastered with mud or clay. They are usually covered with thick flag-stones, which increase the weight, and soon reduce them to a most ruinous state.

See Duncomb's *Herefordshire;* Marshall's *Rural Economy;* Lodge's *Sketches;* Clark's *General View;* and Brayley and Britton's *Beauties of England,* vol. vi. (G.)

HERESY, an offence against Christianity, consisting in a denial of some of its essential doctrines, publicly and obstinately avowed. It is defined *sententia rerum divinarum humano sensu excogitata, palam docta et pertinaciter defensa.* And here it must be acknowledged, that particular modes of belief or unbelief, not tending to overturn Christianity itself, or to undermine the foundations of morality, are by no means the object of coercion by the civil magistrate. What doctrines therefore should be adjudged heresy, was left by our old constitution to the determination of the ecclesiastical judge, who had therein a most arbitrary latitude allowed him. The general definition of an heretic, given by Lyndewode, extends to the smallest deviations from the doctrines of the holy church. *Hæreticus est qui dubitat de fide catholica, et qui negligit servare ea, quæ Romana ecclesia statuit, seu servare decreverat;* or, as the statute 2 Hen. IV. c. 15, expresses it in English, "teachers of erroneous opinions contrary to the faith and blessed determinations of the holy church." This was very contrary to the usage of the first general councils, which defined all heretical doctrines with the utmost precision and exactness. But what ought to have alleviated the punishment, namely, the uncertainty of the crime, seems to have enhanced it in those days of blind zeal and pious cruelty. It is true, that for the crime of heresy the sanctimonious hypocrisy of the canonists went at first no farther than enjoining penance, excommunication, and ecclesiastical deprivation; though afterwards they proceeded boldly to imprisonment by the ordinary, and confiscation of goods *in pios usus.* But in the mean time they had prevailed upon the weakness of bigoted princes to make the civil power subservient to their purposes, by making heresy not only a temporal, but even a capital offence; the ecclesiastics determining, without appeal, whatever they pleased to consider as heresy, and shifting to the secular arm the odium and drudgery of executions, with which they themselves were too tender and delicate to intermeddle. Nay, they pretended to intercede on behalf of the convicted heretic, *ut citra mortis periculum sententia circa eum moderetur;* well knowing that at the same time they were delivering the unhappy victim to certain death. Hence the capital punishments inflicted on the ancient Donatists and Manichæans by the emperors Theodosius and Justinian; and hence also the constitution of the emperor Frederic mentioned by Lyndewode, adjudging all persons without distinction to be burned with fire who were convicted of heresy by the ecclesiastical judge. The same emperor, in another constitution, ordained, that if any temporal lord, when admonished by the church, should neglect to clear his territories of heretics within a year, it should be lawful for good Catholics to seize and occupy the lands, and utterly to exterminate the heretical possessors. And upon this foundation was built that arbitrary power, so long claimed and so fatally exerted by the supreme pontiff, of disposing of the kingdoms of refractory princes to more dutiful sons of the church. The immediate consequence of this constitution was something singular, and may serve to illustrate at once the gratitude of the holy see, and the righteous punishment of the royal bigot; for, upon the authority of this very constitution, the pope afterwards expelled Frederic from his kingdom of Sicily, and gave it to Charles of Anjou.

Christianity being thus deformed by the demon of persecution upon the Continent, we cannot expect that our own island should have been entirely free from the same scourge; and accordingly we find amongst our ancient precedents a writ *de hæretico comburendo,* which is thought by some to be as ancient as the common law itself. From this writ it appears that the conviction of heresy by the common law was not in any petty ecclesiastical court, but before the archbishop himself in a provincial synod; and that the delinquent was delivered over to the king to be dealt with according to the royal pleasure. Thus the crown had a control over the spiritual power, and might pardon the convict by issuing no process against him; the writ *de hæretico comburendo* being not a writ of course, but issuing only by the special direction of the king in council.

But in the reign of King Henry IV., when the eyes of the Christian world began to be opened, and the seeds of the Protestant religion, though under the opprobrious name of *Lollardy,* took root in this kingdom, the clergy, taking advantage of the king's dubious title to demand an increase of their power, obtained an act of parliament, which sharpened the edge of persecution to its utmost keenness. By that statute, the diocesan alone, without the intervention of a synod, might convict of heretical tenets; and unless the convict abjured his opinions, or if after abjuration he relapsed, the sheriff was bound *ex officio,* if required by the bishop, to commit the unhappy victim to the flames, without waiting for the consent of the crown. By the statute 2 Henry V. c. 7, Lollardy was also made a temporal offence, and indictable in the king's courts; which thereby gained not an exclusive, but only a concurrent, jurisdiction with the bishop's consistory.

Afterwards, when the reformation of religion began to advance, the power of the ecclesiastics became somewhat moderated; for though it was not then precisely defined what heresy was, yet people were informed in some points what it was not. The statute 25 Henry VIII. c. 14, declared that offences against the see of Rome were not heresy; and the ordinary was thereby restrained from proceeding in any case upon mere suspicion; that is, unless the party delated were accused by two credible witnesses, or an indictment of heresy had been previously found in the king's courts of common law. And still the spirit of persecution was not yet abated, but only diverted into a lay channel. For in six years afterwards, by statute 31 Henry VIII. c. 14 the law of the six articles was made, which established the six most contested points of popery, namely, transubstantiation, communion in one kind, the celibacy of the clergy, monastic vows, the sacrifice of the mass, and auricular confession; points which were "determined and resolved by the most godly study, pain, and travail of his majesty, for which his most humble and obedient subjects, the lords *spiritual* and temporal and the commons, in parliament assembled, did not only render and give unto his highness their most high and hearty thanks," but did also enact and declare all oppugners of the first to be heretics, and to be burned with fire, and of the five others to be felons, and to suffer death. The same statute established a new and mixed jurisdiction of clergy and laity for the trial and conviction of heretics; the reigning prince being then equally intent on destroying the supremacy of the bishops of Rome, and at the same time establishing all their corruptions of the Christian religion.

Without perplexing this detail with the various repeals and revivals of these sanguinary laws in the two succeeding reigns, we proceed to the reign of Queen Elizabeth, when the reformation was finally established with temper and decency, unsullied with party-rancour or personal caprice and resentment. By statute 1 Eliz. c. 1, all former statutes relating to heresy were repealed, and the jurisdiction of heresy was left as it stood at common law, viz. as to the infliction of common censures in the ecclesiastical courts; and in case of burning the heretic, in the provincial synod only. Sir Matthew Hale is indeed of a different opinion, and holds that such power resided also in the diocesan; though he agrees that in either case the writ *de hæretico comburendo* was not demandable of common right, but grantable or otherwise merely at the king's discretion. But the principal point now gained was, that by this statute a boundary was for the first time set to what should be accounted heresy. For the future nothing was to be determined heretical but only such tenets as had been heretofore so declared, first, by the words of the Holy Scriptures; or, secondly, by the first four general councils, or such others as had only used the words of the Holy Scriptures; or, thirdly, which should thereafter be so declared by the parliament, with the assent of the clergy in convocation. Thus was heresy reduced to a greater certainty than before; though it might not have been amiss to have defined it in terms still more precise and particular, as even yet a man continued liable to be burned for what perhaps he did not understand to be heresy till the ecclesiastical judge had so interpreted the words of the canonical scriptures.

But the writ *de hæretico comburendo* remained still in force; and we have instances of its being put in execution against two Anabaptists in the seventeenth of Elizabeth, and two Arians in the ninth of James I. But it was totally abolished, and heresy again subjected only to ecclesiastical correction, *pro salute animæ*, by virtue of the statute 29 Car. II. c. 9; for, in one and the same reign, our lands were delivered from the slavery of military tenures, our bodies from arbitrary imprisonment by the *habeas corpus* act, and our minds from the tyranny of superstitious bigotry by removing this last badge of persecution from the system of English law.

HERETIC, a general name for all those persons of any religion, but especially the Christian, who profess or teach religious opinions contrary to the established faith, or to what is fixed as the standard of orthodoxy.

HERETOCHS, amongst our Saxon ancestors, signified the same with dukes or duces, denoting the commanders or leaders of their armies.

It appears, from the laws of Edward the Confessor, that the military force of this kingdom was in the hands of the dukes or heretochs, who were constituted through every province and county in the kingdom, being selected from the principal nobility, and such as were most remarkable for being *sapientes, fideles, et animosi.* Their duty was to regulate and command the English armies; and because of their great power, they were elected by the people in their full assembly, or folkmote, in the same manner as sheriffs were elected.

HERFORDEN, a city of Prussia, the capital of a circle of the same name, in the Minden division of the province of Westphalia. It stands at the junction of the rivers Aa and Werre, and its walls are converted into promenades. It contains 1396 houses and 6804 inhabitants, with four Lutheran and one Reformed church. There is a large house of correction, with 500 prisoners, who are employed in spinning cotton. There are several mills for spinning and weaving cotton goods, and manufactures of linen. Long. 8. 33. 49. E. Lat. 52. 7. 25. N.

HERGEST'S ISLANDS, a group of islands in the South Pacific Ocean, so called from Lieutenant Hergest, by whom they were discovered in 1792. They consist of Riou's, Trevenen's, Sir Henry Martin's, and Robert's Isles, and extend from longitude 219. 47. to 220. 21. E. and latitude 7. 53. to 9. 14. S.

HERIOT, in *Law*, a customary tribute of goods and chattels, payable to the lord of the fee on the decease of the owner of the land.

HERISAU, a town, the capital of the canton of Appenzell, in Switzerland. It stands in a beautiful district, is well built, and contains 750 houses and 7000 inhabitants. It is a place of extensive manufactures, especially of cotton goods for the fairs of Germany. Long. 9. 11. 5. E. Lat. 47. 23. 16. N.

HERISSON, in *Fortification*, a beam armed with a great number of iron spikes with their points turned outwards, and supported by a pivot on which it turns. Herissons serve as barriers to block up passages, and are frequently placed before the gates, and more especially the wicket-doors, of a town or fortress, to secure those passages which must of necessity be frequently opened and shut.

HERIURA, a town of Hindustan, in the south of India, and province of Mysore, situated on the east side of the river Vedawati. During the government of the Chittledroog rajahs it was a place of great consequence, and contained 2000 houses, with an outer and inner fort. It was twice sacked by the Mahrattas in the reign of Hyder; and has since fallen into great decay, owing partly to a dreadful famine which followed, and swept away most of the inhabitants. Under its present mild government the town is gradually reviving. Long. 76. 37. E. Lat. 13. 46. N.

HERMÆA, in *Antiquity*, ancient Greek festivals celebrated in honour of the god Hermes or Mercury. One of these was celebrated by the Pheneatæ in Arcadia; a second by the Cellenians in Elis; and a third by the Tanagræans, where Mercury was represented carrying a ram upon his shoulder, because he was said to have walked through the city in that manner in time of a plague, and to have cured the sick, in memory of which, it was customary at this festival for one of the most beautiful youths in the city to walk round the walls with a ram upon his shoulder. A fourth festival of the same name was observed in Crete, when it was usual for the servants to sit down at the table whilst their masters waited; a custom which was also observed at the Roman Saturnalia.

HERMOGENES, ST, an island in the North Pacific Ocean, about six leagues in circuit, discovered by Behring, and further explored by Cook, situated at the entrance of Cook's Inlet, and separated from the adjacent coast by a channel one league broad. Long. 152. W. Lat. 58. 20. N.

HERMANN, PAUL, a celebrated botanist, was born at Halle, in Saxony, and practised physic in the island of Ceylon, and the Cape of Good Hope, after which, in 1679, he was chosen professor of botany at Leyden, and superintendent of the botanical garden. In the science of plants he obtained the highest reputation, and died in the year 1695. His first publication, in 1687, was a catalogue of plants in the university garden, which he had much enriched with plants from the East and West Indies. His method of botanical classification is contained in his *Floræ Lugduno-Batavæ Flores*, published in 1690. His *Paradisus Batavus* was published after his decease by William Sherard, and contains many rare, with some entirely new species, delineated in a very elegant manner. The rest of Hermann's works are, *Musæi Indici Catalogus, continens varia exotica animalia, insecta, vegetabilia, mineralia*; and *Lapis Lydius Materiæ Medicæ*, in which last his new characters of plants are made use of to illustrate their medical properties. At his death he left behind him four hundred and fifty fine drawings, and a numerous collection of dried plants, which served as the basis of the *Flora Ceylanica* of Linnæus, and also a Catalogue of Plants of the Cape of Good Hope. Dr Hannes addressed to him a beautiful Latin ode, which is still preserved; but many of the treasures of his industrious life were strangely neglected, and allowed to be dispersed.

HERMANSTADT, a city of Hungary, in the province of Sieberbergen, the capital of a circle of the same name, which extends over 984 square miles, and contains about 60,000 inhabitants. The city is situated on the river Eidin, and is surrounded with double walls and extensive suburbs. It contains four Lutheran, three Catholic, one Reformed, and one Greek church, and is the seat of a Greek bishop, of a Lutheran lyceum with ten professors and a good library, of a Catholic orphan-house with 500 pupils, and a gymnasium or high school attached to it, and of the palaces of several of the nobles of the province. It has 2000 houses and 16,450 inhabitants. There are carried on within the city the trades of cloth and blanket-weaving, hat-making, and other manufactures. Long. 24. 3. 53. E. Lat. 45. 47. 4. N.

HERMAPHRODITE is generally understood to signify a human creature possessed of both sexes, or who has the parts of generation of both male and female. The term however is also applied to other animals, and even to plants. The word is formed from the Greek ‛Ερμαφροδιτος, a compound of ‛Ερμης, *Mercury*, and Αφροδιτη, *Venus*; a mixture of Mercury and Venus, or of male and female. Hermaphroditus was originally a proper name applied by the heathen mythologists to a fabulous deity, whom some represent as a son of *Hermes*, Mercury, and *Aphrodite*, Venus, and who, being desperately in love with the nymph Salamis, obtained permission of the god to have his body and hers united into one. But others say, that the god Hermaphroditus was conceived as a composition of Mercury and Venus; to exhibit the union between eloquence, or rather commerce, of which Mercury was god, with pleasure, of which Venus was the proper deity. Lastly, others think this junction intended to show that Venus or pleasure was of both sexes.

In a treatise by Mr Hunter, in the sixty-ninth volume of the *Philosophical Transactions*, hermaphrodites are divided into *natural*, and *unnatural* or monstrous. The first belongs to the more simple orders of animals, of which there are a much greater number than of the more perfect. The unnatural takes place in every tribe of animals having distinct sexes, but is more common in some than in others. The human species, our author imagines, has the fewest; but amongst horses, sheep, and black cattle, they are very frequent.

Hermaphrodite *Flowers*, in *Botany*. These are so called by the sexualists, on account of their containing both the antheræ and stigma, the supposed organs of generation, within the same calyx and petals. Of this kind are the flowers of all the classes in Linnæus's sexual method, except the classes *monœcia* and *diœcia*; in the former of which, male and female flowers are produced on the same root; in the latter, in distinct plants from the same seed. In the class *polygamia*, there are always hermaphrodite flowers mixed with male or female, or both, either on the same or distinct roots. In the plantain-tree the flowers are all hermaphrodite; in some, however, the antheræ or male organ, in others the stigma or female organ, proves abortive. The flowers in the former class are styled *female hermaphrodites*; in the latter, *male hermaphrodites*. Hermaphrodites are thus as frequent in the vegetable kingdom as they are rare and scarce in the animal one.

HERMAS, an ecclesiastical author of the first century, and, according to Origen, Eusebius, and Jerome, the same whom St Paul salutes in the end of his epistle to the Romans. He wrote a book in Greek some time before Domitian's persecution, which happened in the year 95. This work is entitled *The Pastor*, from his representing an angel speaking to him in it under the form of a shepherd. The Greek text is lost, but a very ancient Latin version is still extant. Some of the fathers have considered this book as canonical. The best edition of it is that of 1698, where it is to be found amongst the other apostolical fathers, illustrated with the notes and corrections of Cotelerius and Le Clerc. It was translated into English by Archbishop Wake.

HERMES, or Herma, amongst antiquaries, a sort of square or cubical figure of the god Mercury, usually made of marble, though sometimes of brass or other materials, without arms or legs, and planted by the Greeks or Romans in their cross-ways.

Servius, in his comment upon the eighth book of the Æneid, states the origin of this. Some shepherds, says he, having one day caught Mercury, called by the Greeks *Hermes*, asleep on a mountain, cut off his hands, whence he, as well as the mountain where the action occurred, was denominated Cyllenius, from κυλλος, *maimed*; and hence it is, according to Servius, that certain statues without arms are denominated *Hermæ*. But this etymology of the epithet of Cyllenius contradicts most of the other ancient authors, who derive it from this, that Mercury was born at Cyllene, a city of Elis, or even on the mountain Cyllene itself, which had been so called before his time.

Suidas gives a moral explication of the custom of making statues of Mercury without arms. The Hermeses, he informs us, were statues of stone placed at the vestibules or porches of the doors and temples at Athens; and as Mercury was the god of speech and truth, square and cubical statues were peculiarly proper, because they have this in common with truth, that on what side soever they are viewed, they always appear the same.

Athens abounded more in Hermeses than any other place; there were numbers of them in different parts of the city, and they were indeed one of its principal ornaments. They were also placed in the high-roads and cross-ways, because Mercury, who was the courier of the gods, presided over the high-ways; hence his surname of Trivius, from *trivium*, and that of Viacus, from *via*.

From Suidas's account, above cited, it appears that the *termini*, used amongst us in the door-cases, balconies, and other parts of our buildings, take their origin from these Athenian Hermeses, and that it was more proper to call them *hermetes* than *termini*, because, though the Roman termini were square stones, on which a hand was frequently placed, yet they were rather used as landmarks and mere stones than as ornaments of building.

HERMESIANAX, a poet of Colophon, in Asia Minor, of whose private history we know scarcely any thing. He seems to have flourished about B. C. 280, at the same time as Theocritus, and was the author of three books of elegies, which he addressed to his mistress Leontium, as Propertius did to Cynthia. Athenæus (xiii. 597) has preserved ninety-eight verses of a very beautiful elegy, which has been published separately by Weston in his *Conjecturæ in Athenæum*, Lond. 1784. Van Santen has translated it into Latin verse under the title of *Tentamen Hermesianacteum*, as also Rigler and Axti (Colon. 1828). The best edition is by Bach (Hale, 1829). See Leontium.

HERMETIC, or *Hermetical Art*, a name given to chemistry, on the supposition that Hermes Trismegistus was the inventor of that science, or that he excelled therein.

Hermetical *Philosophy* is that which undertakes to solve and explain all the phenomena of nature from the three chemical principles, salt, sulphur, and mercury.

Hermetical *Physic*, or *Medicine*, is that system or hypothesis in the art of healing, which explains the causes of diseases, and the operations of medicine, on the principles of the hermetical philosophy.

Hermetical *Seal*, a manner of stopping or closing glass vessels, for chemical operations, so very accurately, that nothing can exhale or escape, not even the most subtile spirits. It is performed by heating the neck of the vessel in the flame of a lamp till it be ready to melt, and then with a pair of pincers twisting it close together. This they call putting on *Hermes's seal.*

HERMHARPOCRATES, or Hermarpocrates, in *Antiquity*, a deity, or figure of a deity, composed of Mercury, and Harpocrates the god of silence.

HERMIANI, or Hermiatitæ, a sect of heretics in the second century, so called from their leader Hermias. They were also denominated *Seleuciani.* One of their distinguishing tenets was, that God is corporeal; and another, that Jesus Christ did not ascend into heaven with his body, but left it in the sun.

HERMIONE, in *Ancient Geography*, a considerable city of Argolis. Excepting a few temples, it was in ruins in the time of Pausanias, who says that the new city was situated at the distance of four stadia from the promontory on which stood the temple of Neptune. It gave name to the Sinus Hermionicus, a part of the Sinus Argolicus.

HERMIT, or Eremit, *Eremita*, a devout person retired into solitude, to be more at leisure for prayer and contemplation, and to disencumber himself of the affairs of this world. The word is formed from the Greek, ἐρημος, *desert* or *wilderness;* and hence, according to the etymology, it should rather be written *Eremit.* Paul surnamed the *Hermit* is usually reckoned the first hermit; though St Jerome, at the beginning of the life of that saint, says it is not known who was the first. Some go back to the time of John the Baptist, others to that of Elias; some make St Anthony the founder of the eremitical life, and others think that he only rekindled and heightened the fervour thereof, holding that the disciples of that saint owned St Paul of Thebes as the first who practised it. The persecutions of Decius and Valerian are supposed to have been the occasion of driving men to the wilderness.

There are also various orders and congregations of religious persons distinguished by the title of *hermits;* as hermits of St Augustin, of St John Baptist, of St Jerome, of St Paul, and so forth.

HERMITAGE properly signifies a little hut or habitation, in some desert place, where a hermit dwells.

Hermitage is also popularly attributed to any religious cell, built and endowed in a private and recluse place, and thus annexed to some large abbey, of which the superior was called *hermita.*

HERMOGENES, the first and most celebrated architect of antiquity, was, according to Vitruvius, born at Alanbada, a city in Caria. He built a temple of Diana at Magnesia, and another of Bacchus at Tros; and he was the inventor of several parts of architecture. He composed a book on the subject, which is lost.

Hermogenes *Tarsensis*, a rhetorician and orator, who was in every respect a prodigy. At the age of seventeen he published his system of rhetoric, and at twenty his philosophic ideas; but at twenty-five he forgot every thing he had known. It is said that his body being opened after his death, his heart was found of an extraordinary size, and all covered with hair. He died about 168 before Christ.

HERMOGENIANS, a sect of ancient heretics, so denominated from their leader Hermogenes, who lived towards the close of the second century. Hermogenes established matter as his first principle; and regarding it as the source of all evil, he maintained that the world, and every thing contained in it, as also the souls of men and other spirits, were formed by the Deity from an uncreated and eternal mass of corrupt matter. The opinions of Hermogenes, with regard to the origin of the world and the nature of the soul, were warmly opposed by Tertullian. The Hermogenians were divided into several branches under their respective chieftains; as Hermiani, Seleuciani, Materiani, and so on.

HERMON, or Aermon, in *Ancient Geography*, a mountain of the Amorites, called Sanior by the Phœnicians, and Sanir or Senir by the Amorites, on the east of Jordan. It is also called *Sion*, but must not be confounded with the Sion of Jerusalem.

HERMOPOLIS, in *Ancient Geography*, the name of several cities in Egypt, dedicated, as the name imports, to Hermes or Mercury. Near one of these cities, probably Hermopolis Magna, was situated a most magnificent temple, of which the portico only remains. It was visited by Denon, who accompanied the French army in their expedition to Egypt in 1799, and who describes it as a most beautiful monument of ancient architecture, a splendid relic of the highest antiquity. Amongst the hillocks within three hundred or four hundred yards of the portico, enormous blocks of stone are seen buried in sand, and regular architecture beneath, which appears part of an edifice containing columns of granite, just rising above the present level of the soil. Every part of this edifice is covered with hieroglyphics. Connected with the scattered fragments of the great temple, a mosque has been built, in which is a number of columns of cipoline marble. Near this is the village of Aschmuneïn, containing about 5000 inhabitants.

HERMUS, in *Ancient Geography*, a river of Ionia, which, rising near Dorylæum, a town of Phrygia, in a mountain sacred to Dindymene or Cybele, touched Mysia, and ran through the *Regio Combusta*, and then through the plains of Smyrna down to the sea, carrying along with it the Pactolus, Hyllus, and other less notable rivers. Its waters were said, by Virgil and other poets, to roll down gold.

HERNOSAND, a town of Sweden, the capital of the province of Norrlandslan. It is the seat of a bishop, and is built on the island formed by two arms of the river Angerman, which here empties itself into the Gulf of Bothnia. The harbour is one of the best in Northern Sweden. It contains 340 houses, and 1980 inhabitants, who are occupied in linen weaving, in ship-building, and in the fishery. Long. 17. 46. 7. E. Lat. 63. 38. N.

HERO, in Pagan mythology, a great and illustrious person, of a mortal nature, though supposed by the populace to have partaken of immortality, and after his death to have been placed amongst the number of the gods. The word is formed from the Latin *heros*, and that from the Greek ἡρως, *semi-deus* or demi-god. The Greeks erected columns and other monuments over the tombs of their heroes, and established a kind of worship in honour of the manes both of their heroes and heroines. The Romans also raised statues in honour of their heroes; but there were six of their heroes of a superior order, who were supposed to have been admitted into the community of the twelve great gods, namely, Hercules, Bacchus, Æsculapius, Romulus, Castor, and Pollux. Writers have distinguished between the worship which the ancients paid to their heroes and that offered to their gods. The latter, it is said, consisted of sacrifices and libations; the former was only a kind of funeral honour, in which they celebrated their exploits, concluding the rehearsal with feasts.

Hero is also used in a more extensive sense, for a great, illustrious, and extraordinary personage.

Hero, in fabulous history, a famous priestess of Venus, lived at Abydos, in a tower situated on the banks of the Hellespont. She was beloved by Leander, who lived at Sestos, on the other side of the strait, and every night swam across to visit her, being directed by a light fixed on the tower. But the light being put out on a stormy night, the youth missed his way and was drowned; upon which Hero threw herself into the sea, and perished.

Hero, the name of two celebrated Greek mathematicians; the one called the *older* and the other the *younger Hero*. The latter was a disciple of Ctesibius. They are known by two works translated into Latin by Barochius; *Spiralium liber*, by Hero the elder; and *Tractat. Artis et Machin. Militar.* by Hero the younger. They flourished about 130 and 100 B. C.

HEROD, surnamed the Great, was born about seventy-one years before the commencement of the Christian era. When about twenty-five years of age, his father Antipater made him governor of Galilee, where he distinguished himself by suppressing a band of robbers, and executing their ringleader. For this action, which was performed by his own authority, and without trial of the criminals, he was ordered to appear before the Sanhedrim; but, by the influence of his party, and the favour of the high priest, he escaped judgment. During the civil war between the republican and Julian parties, Herod joined Cassius, was made governor of Cœlosyria, caused Malichus to be assassinated for having poisoned his father, and ingratiated himself with Marc Antony. After wandering for some time as an exile in Egypt, he found means to arrive at Rome, where Antony received him with great kindness, and the senate made choice of him for the crown of Judæa, about forty years before the birth of Christ. It was at that time in the possession of Antigonus, and he had consequently to fight his way to it. But he was finally victorious, Antigonus was taken prisoner, and Herod succeeded to the regal dignity in the year thirty-seven before Christ. In filling his empty coffers he was guilty of many cruel extortions; yet it is but justice to add, that he performed many acts of clemency. He sent for the aged high priest Hyrcan, who had been deposed, treated him with the greatest kindness, and raised Aristobulus, the brother of his beloved Mariamne, to the pontifical dignity. But soon afterwards, in a fit of jealousy, he caused Aristobulus to be drowned in a bath. Being accused to Antony by his mother-in-law, he appointed his uncle Joseph to govern in his absence, charging him to put the queen to death if his trial should prove fatal to him, as he could not support the idea of her falling into the possession of another.

Herod received a visit from Cleopatra, who is reported to have had amorous inclinations towards him, which he prudently disappointed, from fear of the vengeance of Antony; but he satisfied her avarice with the most ample donations. When hostilities commenced between Antony and Octavius, he raised an army to join the former; but had first to contend with Malchus, king of part of Arabia, whom he defeated, and compelled to sue for peace. After the battle of Actium, he resolved to make terms with the victor, and with this view he put the aged Hyrcan to death, and embarked for Rhodes, where Augustus at that time was. He appeared before the emperor in all the insignia of royalty except his diadem, boldly relating all the services he had performed to his benefactor Antony, and observed that he was willing to transfer the same gratitude to a new patron, from whom he might hold his crown and kingdom.

Augustus was struck with the magnanimity of this defence, and replaced the diadem on his head. When Augustus passed through Syria in his way to Egypt, he was magnificently entertained by Herod, to whom he restored the whole of his dominions, which he even enlarged. Before his interview with Augustus, Herod had given a second order respecting the murder of Mariamne; and becoming jealous of Sohemus, her last guardian, he soon afterwards had her condemned and executed, in spite of the most solemn protestations of innocence. But the remorse occasioned by this barbarous murder was dreadful, and no scenes of riot or debauchery could banish her from his mind. He would frequently call aloud upon her name, and order his attendants to bring her into his presence, as if unwilling to forget that she was no more. He built an amphitheatre at Jerusalem, for the purpose of celebrating games in honour of Augustus; but this exasperated the Jews to such a degree, that a conspiracy was formed against him, which however was detected, and the principal contrivers punished with merciless severity.

He built several strong fortresses in different parts of Judæa for his own security, one of which, in honour of the emperor, was denominated Cæsarea. To supply in some measure the loss of Mariamne, he married another lady of the same name, the daughter of a priest, whom he raised to the supreme pontificate. He was in such favour with Augustus, that he was appointed imperial procurator of Syria, and obtained a tetrarchate for his brother. To conciliate the favour of the Jews, he undertook the vast work of rebuilding the temple of Jerusalem; and, by constantly employing a whole army of workmen for a year and a half, this magnificent edifice was completed. In the course of another visit to the emperor, Herod obtained new favours, particularly a grant of half the produce of the mines of Cyprus, and the inspectorship of the rest. After this he dedicated his new city of Cæsarea, when he exhibited so much profuse magnificence, that Augustus declared his soul was too large for his kingdom. He procured the condemnation and death of his two sons by the first Mariamne, for which he has been bitterly accused; but when we recollect that he took the greatest care of the two sons whom each left behind him, we must conclude that there may have been more reason for their punishment than some are willing to allow. The charge brought against them was an unnatural conspiracy against his life and crown, and it seems to have been fairly substantiated. His brother Pheroras, and his favoured son Antipater, conspired against him; but soon after the discovery of the plot the former died, and the latter went to Rome.

The birth of Christ happened in the thirty-third year of his reign, and is said to have been soon followed by that act of barbarous cruelty, the massacre of the children of Bethlehem, instigated by jealousy of this king of the Jews in a spiritual sense, of whose birth he had obtained information from the magi. It is to be observed that the account of this deed is to be met with nowhere but in St Matthew's gospel; for whilst Josephus seems to dwell with studied minuteness on the cruelties of Herod, he drops not a single hint respecting this massacre. As Antipater was returning from Rome, he was arrested by his father's orders, tried and condemned for treasonable practices. These calamities, joined to a shattered constitution, threw Herod into a loathsome distemper, accompanied with remarkable symptoms, which has sometimes been considered as a judgment from heaven. He ordered the sentence against Antipater to be put in execution, and appointed his son Archelaus to succeed him on the throne. According to Josephus, he collected together at Jericho the chief persons amongst the Jews, whom he ordered to be shut up in the circus, giving strict orders to his sister Salome to have them all massacred as soon as he had breathed his last. This order was never executed, and we very much doubt whether it was ever given.

His remains were interred with great pomp and magnificence; and although his memory has been consigned to detestation and abhorrence, his great talents and the glories of his reign conspire to secure him a distinguished place in the list of able but unscrupulous sovereigns.

HERODIANS, a sect amongst the Jews at the time of our Saviour. The critics and commentators are very much divided with regard to the Herodians. St Jerome, in his dialogue against the Luciferians, takes the name to have been given to those who owned Herod as the Messiah; and Tertullian and Epiphanius are of the same opinion. But the same Jerome, in his Commentary on St Matthew, treats his opinion as ridiculous, and maintains that the Pharisees gave this appellation by way of ridicule to Herod's soldiers, who paid tribute to the Romans; and accordingly the Syrian interpreters render the word by *the domestics of Herod*, that is, his courtiers. Simon, in his notes on the twenty-second chapter of St Matthew, advances a more probable opinion. The name *Herodian* he imagines to have been given to such as adhered to Herod's party and interest, and were for preserving the government in his family, about which were great divisions amongst the Jews. Hardouin represents the Herodians and Sadducees as the same. Dr Prideaux is of opinion that they derived their name from Herod the Great, and that they were distinguished from the other Jews by their concurrence with Herod's scheme of subjecting himself and his dominions to the Romans, and likewise by complying with many of their heathen usages and customs. This symbolizing with idolatry upon views of interest and worldly policy was probably that leaven of Herod against which our Saviour cautioned his disciples. It is further probable that they were chiefly of the sect of Sadducees, because the leaven of Herod is also denominated the leaven of the Sadducees.

HERODIANUS, a Greek historian of considerable celebrity, respecting whose birthplace we are ignorant, but he seems to have spent much time at Rome. Of his private history we know nothing, except that he flourished in the reign of the younger Gordian (A. D 238). His work, which has been preserved, contains, in eight books, the lives of the later Roman emperors, from the death of M. Aurelius Antoninus (A. D. 180) to the succession of the younger Gordian (A. D. 238), a period of fifty-eight years. It thus contains an account of the transactions during the reigns of Commodus, Pertinax, Julianus, Niger and Albinus, Severus, Caracalla and Geta, Macrinus, Heliogabalus, Alexander Severus, Maximinus, the two Gordians, Balbinus, and Gordian the younger. The style of his history is simple and natural, free from that affected Attic purity which was the fault of the writers of his age. Still in many passages there are evident marks of his having imitated Thucydides, and sometimes Demosthenes and Polybius. The period which he undertook to describe was one full of spirit-stirring events; frequent changes of emperors, constant wars both foreign and domestic, numerous earthquakes, plague and pestilence, were all crowded into the page of half a century. Whilst occupied with these wars and wonderful phenomena, he forgets to make us acquainted with the internal changes that were taking place in the constitution of the Roman empire; and whilst he gives us a minute account of the contests for empire, of court intrigues, and long, often unmeaning, speeches, he omits to notice the movements of those barbarous hordes which had already begun to threaten, and shortly after succeeded in subverting, the Roman empire. All however of which he gives us an account bears on it the stamp of truth, though perhaps he sometimes praises beyond what they deserve, hazards blame with too lenient a hand, and approves of characters which are only distinguished for their follies and their vices. Herodian is the last of the Greek historians of importance. The first edition is by Aldus, Venice, 1503; another by Stephens, Paris, 1581. There is a large edition in five volumes by Irmiseh, Leipsig, 1789, 1805. The best is by Becker, Berlin, 1826. See also Wolf. *Narratio de Herodiano et libro ejus*, in his edition of Herodian, Hal. Sax. 1792. There are several German translations, of which the best are by Gunradi Frankfort, 1784, and by Osiander, Stuttgardt, 1830.

HERODIANUS, a grammarian of Alexandria in Egypt, was son of the grammarian Apollonius Dyscolus. He seems to have resided at Rome in the reign of M. Aurelius, A. D. 163, to whom we find him dedicating a work on Prosody (Πϱοσῳδια Καθολικη), in twenty books. He is praised by the ancients as an acute philologist, and possessed an intimate knowledge of grammar, which is proved to be correct by the numerous fragments of his works. (See Fabricii *Biblioth. Græc.* ed. Harles, v. vi. p. 278; also *Essai Historique sur l'Ecole d'Alexandrie*, par Matter, Par. 1820.)

HERODOTUS, a celebrated historian, the son of Lyxas and Dryo, was a native of Halicarnassus, a city of Asia Minor. He was born 484 A. C. being descended of a family not less distinguished for its love of literature than for its wealth and political influence. His uncle Panyasis was highly esteemed as an epic poet, his writings being regarded by his contemporaries as only second to those of Homer. We are therefore justified in believing that the youthful mind of Herodotus was cultivated with an assiduity which contributed in no small degree to the eminence of his maturer years. (Suidas, Ἡϱοδοτος and Πανυασις, Schol. Aristoph. Nab. 331.) The period of history which he selected had nothing of novelty to recommend it; many writers of great celebrity had preceded him, but their high name and reputation, far from discouraging him, served only to excite his emulation and to develope his talents. Xanthus of Lydia, Hecatæus of Miletus, Pherecydes, Acesilaus, Hellanicus of Lesbos, Charon of Lampsacus, had each treated different parts of his subject with a masterly hand, and it required no small confidence in his own powers to venture on a period of history which had been so nearly exhausted. To enable him to do justice to his subject, he determined to visit those countries the transactions of which he was about to narrate. It is impossible to trace the exact route which he pursued with any degree of precision, or to say with certainty whether he visited Greece and the adjoining isles before he proceeded to the more remote parts of the East. But be this as it may, Egypt was one of the first and most constant objects of his attention and research. This country, which had long been inaccessible to strangers, from the defensive policy of its sovereigns and the inhospitable nature of its inhabitants, had been recently thrown open to the Greeks. Thither Herodotus proceeded; and it is curious to remark, that though many since that period have visited the country, and published the results of their inquiries, no one has given a more exact description, either of the physical appearance of Egypt, or of the manners of its inhabitants, than the father of history. It was not merely to the geography of the country that he directed his attention, but to its productions, its peculiar customs, its strange superstitions, and the history of the princes who reigned immediately before its conquest by the Persians. In his second book we have the fruits of his voyage to Egypt; and it may be still referred to as the purest source for acquiring a minute knowledge of its ancient history and institutions. (Herodotus, ii.)

From Egypt he must have passed into Libya, for we cannot believe that his accurately detailed account of the whole coast, from the frontiers of Egypt to the remote districts beyond Gibraltar, even as far as the promontory of Solocis, could have been acquired otherwise than by personal examination. It is too minute, and too conformable with what we know of these countries at the present time, to have been collected from the hearsay statements of travellers. (ii. 181; iv. 168, 195, 196.)

His visit to Tyre, the splendid city of the Phœnicians, is attested by himself (ii. 44); and he must at the same time have examined the coasts of Palestine, as he mentions having seen the pillar, and the disgraceful emblem engraved on it, intended by Sesostris to commemorate his victory, about 1350 A. C., over a weak and demoralized people. (ii. 106.)

Some have ventured to deny that he ever journeyed so far to the east as Babylon, and the rich plains of Assyria: yet if he had not been on the spot, he could scarcely have delineated with such minuteness the topography of that mighty city. Besides, in recording the existence of the temple of Jupiter Belus, he adds that he did not see the celebrated golden statue which had adorned its shrine, because Xerxes had carried it elsewhere (i. 181). We may add, that his frequent intercourse with the Chaldæans, and the conversations he held with them, could scarcely have taken place in any part of the world beyond the confines of Assyria.

Colchis, as the theatre of an adventure depicted in all the glowing colours with which the creative genius of the poets could adorn it, was a natural object of curiosity. He traversed its rugged coast; and finding himself in the vicinity of the wandering Scythians, he penetrated into their wild and desolate solitude as far as the commercial speculations of the Greeks had reached (iv. 81). The country of the Getæ, Thrace, Macedon, and Epirus, were each in their turn examined; but Greece was the chief object of his labours; and though we are unable to specify the time when he first visited it, he no doubt did so before his work was begun.

On his return to his native city, he found its government usurped by the tyrant Lygdamis: his uncle Panyasis was soon afterwards put to death: and he himself becoming an object of suspicion, retired to the island of Samos. Here probably he composed his history, in the soft Ionic dialect, preferring it to the harsher sounds of his native Doric. Yet, amidst the pursuits of literature, he did not forget the claims of the city which gave him birth. He organized a conspiracy by which Lygdamis was expelled; but the tyranny of the aristocracy which succeeded proved even more hateful to the citizens than that from which they had been delivered. They probably ascribed to Herodotus the crimes of his associates, which he had no power to avert; and, disgusted with the ingratitude of his fellow-citizens, the historian left for ever the shores of Caria, and proceeded to Greece. (Lucian *in Herod.* iv. p. 116.)

He arrived at the beginning of the eighty-first Olympiad (456 A. C.), and found a vast concourse of people assembled to celebrate the games at Olympia. He was unknown to all; but, ambitious of fame, he invited an audience to come and hear him recite a portion of his history; and as he no doubt selected the parts most likely to flatter the pride and to excite the enthusiasm of his compatriots, his success was complete, the acclamations with which he was received were overwhelming, and from that moment he was considered one of the first men of his age. It is supposed that it was at this recitation that Thucydides, then in his fifteenth year, shed tears of emulation when he saw the honours showered on the head of the historian. Herodotus foretold to the father the future fame of his son, and the sanction of posterity has verified the prediction. (Suid.; Marcellii *Vit. Thucyd.* p. 32.) Of the next twelve years, we can only conjecture that he spent them in Greece, and that he employed them in travelling leisurely over the country, examining with attention the archives of different people, verifying on original monuments the genealogies of the most illustrious families, and collecting the local traditions of great events at their source. It is said he was in the habit of reading to the different states the portions of history which more particularly referred to them, and was thus able to correct any error into which he might have fallen. At Athens, at the festival of Panathenæa, 446 A. C., he again recited a portion of his history, and received from the hands of that discerning people a donation of ten talents. (Eusb. *Chron.* p. 104.) In 444 A. C. Athens was preparing to send a colony to Thurium, and Herodotus determined to accompany it as a volunteer. Here he must have spent the remainder of his life in dignified repose, employing his time in retouching his history, and rendering the style still more harmonious. The period of his death is uncertain; but from a fact which he records, and which we know to have happened 408 A. C. he must have been employed in his history till that time. (Herodot. i. 130; iii. 15.)

The work is contained in nine books, each dedicated to one of the muses; but whether this was done by himself or by posterity we are unable to decide. To it we are indebted for our knowledge of the origin and progress of the Persian monarchy; of that of the Medes and Assyrians which preceded it; the origin of the kingdom of Lydia, its destruction by Cyrus the elder, and the numerous expeditions of that monarch; the conquest of Egypt by Cambyses, with a minute description of that country; the various wars in which the successors of Cyrus were engaged, and particularly the expedition of Darius against the Scythians, where he takes an opportunity of introducing an account of that people in the north of Europe and Asia. Then follows his narrative of the Persian expedition against the Greeks, and their noble struggle against the overwhelming power of that monarchy. This narrative breaks off at the siege of Sestos, 478 A. C.; and though he alludes to events that happened seventy years later, he does not seem to have continued his history further. (Diodor. xi. 37.) Some have ascribed to him a life of Homer, which is generally bound up with his work; but there are strong reasons for believing that it is the composition of a later age. He seems also to allude to a work on Assyria (*Assyriaca*), i. 184; but as no notice is taken of it by subsequent writers, it was probably never executed.

For an able disquisition on the style of Herodotus, and his character as an historian, see *Edinburgh Review*, vol. xlvii. p. 331.

HEROIC, something belonging to a hero or heroine.

Heroic Age is that age or period of the world in which the heroes, or those called by the poets the children of the gods, are supposed to have lived. The heroic age coincides with the fabulous age.

Heroic Poem is that which undertakes to describe some extraordinary action or enterprise. Homer, Virgil, Statius, Lucan, Tasso, Camoens, Milton, Wilkie, Glover, Voltaire, and others, have composed heroic poems. In this sense, *heroic* coincides with *epic poem.*

Heroic Verse is that in which heroic poems are usually composed, or it is that which is proper for such poems. In the Greek and Latin, hexameter verses are peculiarly denominated heroic verses, as being alone used by epic poets. Alexandrine verses, of twelve syllables, were formerly called *heroic verses,* as being supposed the only verse proper for heroic poetry; but later writers use verses of ten syllables.

HEROINE, Heroina, or *Herois,* a woman who has the qualities and virtues of a hero, or who has done some heroic action.

HERON. See Ornithology.

HERRENBERG, a city of Wurtemberg, of the circle of the Black Forest, and the capital of a bailiwick of the same name extending over ninety-two square miles, and containing 22,910 inhabitants. The city is situated on the river Auer. It is built around a mountain fortress of great antiquity. It contains 330 houses, and 2100 inhabitants, who produce good wine, and make some woollen goods. Near to it are quarries of marble and alabaster, in which many curious petrifactions are found.

HERRERA Tordesillas, Antonio de, a Spanish historian, the son of Roderigo de Tordesillas and Agnes de Herrera, it being the custom of that country to bear the mother's name, was born in 1565. He was at first secretary to Vespasian de Gonzaga, viceroy of Naples, but was afterwards appointed historiographer of the Indies by

Philip II. who granted him a liberal pension. Whilst he held this office, he wrote his General History of the Indies from 1492 to 1554, in four volumes folio. Of all the Spanish authors, Herrera is the one who has given the most exact and circumstantial recital of the conquest of Mexico, and the other events in America. Hence, to use the words of Dr Robertson, his work "furnishes the fullest and most accurate information concerning the conquest of Mexico, as well as every other transaction of America. The industry and attention with which he consulted, not only the books, but the original and public records, were so great, and he usually judges of the evidence before him with so much impartiality and candour, that his decades may be ranked among the most judicious and useful historical collections." His death, which happened at Madrid on the 29th of March 1625, prevented him from occupying the office of secretary of state, to which Philip IV. had just raised him. Besides the work above mentioned, Herrera wrote in Spanish, 1. Description of the West Indies, Madrid, 1601, in folio; 2. History of what passed in England and in Scotland during the forty-four years of the life of Mary Stuart, queen of Scotland, Lisbon, 1590, in 12mo; 3. Five Books of the History of Portugal, and the conquest of the Açores in the years 1581 and 1583, Madrid, 1591, in 4to; 4. History of the affairs of France from the year 1585 until the end of the year 1594, Madrid, 1598, in 4to; 5. History of the world under the reign of Philip II. from the year 1584 until the year 1598, Valladolid, 1606, in three vols. folio; 6. Historical Treatise, Relation, and Discourse, of the Movements which took place in Aragon in the years 1591 and 1592, in 4to; 7. Commentary on the Proceedings of the Spaniards, the French, and the Venetians, in Italy, from the year 1285 until the year 1559, Madrid, 1624, in folio.

Herrera, *Ferdinand de*, a Spanish poet of the sixteenth century, was born at Seville about the year 1516. He was thoroughly conversant with the Greek, Latin, Italian, and French languages, and also passed for a profound theologian; but he applied himself, in preference, to poetry, and was the first of the four Spanish poets who obtained the surname of divine. Although he had taken holy orders at the age of thirty, all his verses are addressed to a distinguished lady of Andalusia, whom he celebrates under various names; but his love was as pure and platonic as that of Petrarch, whom he endeavoured to imitate, in following the footsteps of Boscan and Garcilaso. Herrera died in his native place about the year 1595. The collection of his poetry, entitled *Obras de Herrera*, Seville, 1619, contains sonnets, songs, lyrics, and elegies, full of spirit, grace, and expression; but his style is at times deficient in correctness. Herrera was also the author of, 1. Relacion de la Guerra de Cypre y batalla de Lepanto, Seville, 1572; 2. Vida y Muerte de Thomas Moro, ibid. 1592, translated from the Latin of Stapleton; 3. An edition of the Poems of Garcilaso de la Vega, with interesting notes, Seville, 1580, in 8vo. (A.)

HERRING, in *Ichthyology*, a species of Clupea. The name *herring* is derived from the German word signifying an *army*, to express their number, when they enter our seas. See Fisheries.

Herring, *Thomas*, archbishop of Canterbury, memorable for his attachment to civil and religious liberty, was the son of a clergyman, and born in the year 1693. He received his grammar-school education at Wisbech, in the isle of Ely; and at the age of seventeen was sent to Jesus College, Cambridge, at which place he was made bachelor of arts in 1714, and had the degree of master of arts conferred upon him about three years afterwards. In the year 1722, he was appointed chaplain to Dr Fleetwood, bishop of Ely, who gave him two rectories; and in 1726 he was nominated preacher to the honourable society of Lincoln's Inn. He was chosen chaplain in ordinary to his majesty about the same period, and obtained from Cambridge the degree of doctor of divinity in the year 1728. Bishop Fleetwood, his patron, declared to his friends that he never heard a sermon from Dr Herring which he would not have been proud to be the author of himself. In 1731, he was chosen rector of Blechingley in Surrey; the same year he was appointed dean of Rochester; and in the year 1737 the king promoted him to the see of Bangor. In 1743 he was elevated to the archiepiscopal see of York; and it was peculiarly fortunate for the country at such a critical juncture, that a man of his principles and public spirit was raised to so exalted a rank. The rebellion in Scotland had been so artfully concealed by its friends in England, that it was scarcely believed the Highlanders were in arms until the royalists were defeated at the battle of Gladsmuir. Amidst the universal consternation which this event occasioned, Archbishop Herring roused the people to a sense of their danger, contributed to assuage the panic, and encouraged them to unite with firmness and vigour in the defence of their country.

A meeting of the nobility, gentry, and clergy, was held at York, where the archbishop addressed them in a very able and animated speech, requesting them to unite as one man in averting the present danger, to preserve their happy constitution, and to contribute by a subscription to raise troops for the defence of the country. The whole assembly entered warmly into his views, and immediately subscribed about L.40,000 for the important purpose recommended by his grace. On the death of Archbishop Potter, which happened in 1747, Dr Herring was translated to the see of Canterbury. In 1753 he was seized with a violent fever, which brought him to the verge of the grave; and although he so far recovered that he languished a few years, yet his strength and spirits were much exhausted, and he expired in 1756, in the sixty-third year of his age. He was buried, according to his own desire, without any pomp or parade, and no monument was erected to his memory.

HERRNHUTH, a town of the kingdom of Saxony, in the circle of Voightland, at the foot of the mountain Hutsberg, but 1054 feet above the level of the sea. It is the place from which the religious sect known in England as Moravians has received the name of Herrnhutters, by which they are commonly distinguished on the Continent. It was built by Count Zinzendorf in 1722, for the reception of the refugees of the sect driven by persecution from Moravia. It contains 100 houses, and about 1400 inhabitants, who are occupied in various manufactures upon a small scale. It is considered as the point of union for the scattered members of the sect in Europe and America.

HERSCHEL, Sir William, an illustrious astronomer, and inventor of the telescope which bears his name, was born at Hanover on the 15th of November 1738. He was the second of four sons, all of whom were brought up to their father's profession, which was that of musician. As he evinced a peculiar taste for intellectual pursuits, his father provided him with a French tutor, who instructed him in the rudiments of logic, ethics, and metaphysics, and under whom he made considerable progress. But, owing to the untoward circumstances of his family, his studies were soon interrupted, and, at the age of fourteen, he was placed in the band of the Hanoverian regiment of guards, a detachment of which he accompanied to England in 1757, or, as some say, in 1759. His father came with him to England, but after the lapse of a few months he returned home, leaving the young musician to push his fortune, as he best could, in London. After struggling with many difficulties, he attracted the notice of the Earl of Darlington, who engaged him to superintend and instruct a military band then forming for the Durham militia. Having ful-

Herschel.

filled this engagement, he passed several years in the west riding of Yorkshire, giving lessons to pupils in the principal towns, officiating as leader in oratorios and public concerts, and employing his leisure hours in improving his knowledge of English, acquiring the Italian language, which he considered as necessary to the exercise of his profession, and instructing himself in Latin, as well as learning a little Greek. About the close of the year 1765, he was appointed to the situation of organist at Halifax, which he obtained through the good offices of Mr Joah Bates, and there continued to give instructions in music, though with what success does not appear. Anxious to make himself master of the theory of harmony, he studied Dr Smith's treatise on that subject; in connection with this science he also cultivated the mathematics, and thus, perhaps unconsciously, prepared himself for those sublime investigations which were destined to open a new field of discovery, and to confer immortality on his name. In the year 1766 he and his elder brother repaired to Bath, where they were both engaged by Mr Linley for the Pump-room band; but the principal object which attracted him to that place was the advantageous situation of organist to the Octagon Chapel, which opened to him a profitable range of engagements at the concerts, the rooms, the theatre, and the oratorios, besides affording him an opportunity of obtaining many private pupils. This accession of employment, however, was so far from abating his propensity to study, that frequently, after the fatigue of twelve or fourteen hours occupied in professional avocations, he sought relaxation (for to him it was really such) in extending his knowledge of the pure and the mixed mathematics.

Some discoveries then recently made having awakened his curiosity, he next applied himself to the study of astronomy, and to that of the auxiliary science of optics, in which he laboured with indefatigable perseverance during every interval of leisure. Anxious to observe with his own eyes the wonders of which he had read, he borrowed from a neighbour in Bath a two-feet Gregorian telescope, which delighted him so much that he commissioned a friend in London to purchase for him one of larger dimensions. The price demanded, however, exceeded both his calculation and his means; but, far from being discouraged, he resolved to attempt with his own hands the construction of that complicated instrument which he had found himself unable to purchase; and in this, after successive disappointments, which served only to stimulate his exertions, he at length succeeded. In the year 1774, he had the inexpressible gratification of beholding the planet Saturn through a five-feet Newtonian reflector constructed by himself, and, with the prophetic instinct of genius, already discerned the path of discovery opening before him. Encouraged by this success, he extended his operations; constructed telescopes of seven, ten, and even twenty feet in length; and worked with such indefatigable perseverance that, in perfecting the parabolic figure of a seven-feet reflector, he finished two hundred specula before producing one which answered his purpose in a satisfactory manner. Becoming more and more attached to astronomy, he now limited his professional engagements, restricted the number of his pupils, and, about the end of the year 1779, commenced a regular survey of the heavens by means of a seven-feet reflector. In the course of his observations, which were continued during eighteen months, he remarked that a star, which had been recorded by Bode as fixed, was progressively changing its position; and prolonged attention to it enabled him to ascertain, beyond all doubt, that it was an hitherto undiscovered planet. Having determined the mean and periodic motions, and the orbit of this body, he communicated the particulars to the Royal Society, who, in return, awarded him their annual gold medal, and unanimously elected him a fellow. This important discovery he made on the 13th of March 1781, and, in compliment to the king of England, bestowed on the planet the name of *Georgium Sidus;* but the Continental astronomers chose to honour the discoverer by calling it *Herschel,* an appellation subsequently changed to that of *Uranus,* which was considered as more consistent with the received astronomical nomenclature.

This discovery at once established the fame of Herschel as an astronomical observer; and the king having bestowed on him a handsome salary, he was enabled to relinquish his profession as musician, and to devote the remainder of his life exclusively to astronomy. Accordingly he quitted Bath; and having fixed his residence first at Datchet and afterwards at Slough, he resumed the career of discovery on which he had so auspiciously entered. His first undertaking was to construct a telescope forty feet in length, which he completed in 1787; but this huge instrument disappointed the expectations he had formed from it; and it was by instruments of a more manageable size that he perused the great volume of the heavens, and derived from it new contributions to enrich the records of science. In these researches, and in the laborious calculations to which they led, he was assisted by his sister Miss Caroline Herschel, whose indefatigable assiduity and devotion in the performance of a task usually considered as incompatible with female habits excited equal surprise and admiration. The discoveries of Herschel were communicated, as they occurred, to the Royal Society, and constitute an important part of the printed transactions of that body during a period extending from 1782 to 1818. In 1783 he announced the discovery of a volcanic mountain in the moon; and four years afterwards he communicated an account of two other volcanoes in the same orb, which appeared to be in a state of eruption. In prosecuting his observations on the planet discovered by himself, he ascertained that Uranus was surrounded with rings, and had six satellites. Although the results obtained by means of the forty-feet telescope were not such as to realize the expectations he had formed, yet they were too considerable to justify the somewhat contemptuous allusion made to them by Lalande in his History of Astronomy. By means of this instrument he discovered the sixth and seventh satellites of Saturn; and in observing the quintuple belt of Saturn, he was enabled to demonstrate the length of its day, and to determine its diurnal rotation. Amongst the papers communicated by this great astronomer, was a memoir on the power of telescopes to penetrate into space, or to render sensible distant and faint objects, which would be imperceptible without the aid of such instruments; and his opinion was, that the greatest amplification cannot exceed that produced by a telescope of from twenty to twenty-five feet. In 1802, he presented to the Royal Society a catalogue of five thousand new nebulæ, nebulous stars, planetary nebulæ, and clusters of stars; preceded by a view of the sideral bodies composing the universe, in which he enumerated twelve species of stars that enter into the composition of the heavenly host.

By these and other scientific labours he established his claim to rank amongst the most eminent astronomers of the age, and amply merited the distinctions which were conferred on him. Oxford had previously done itself honour by bestowing on him the honorary degree of doctor of laws; and in 1816, George IV. then prince regent, invested him with the Hanoverian and Guelphic order of knighthood. Sir William Herschel did not relinquish his astronomical observations until within a few years of his death, which took place on the 23d of August 1822, at the advanced age of eighty-three. He expired full of years and honours, leaving behind him a considerable fortune, and, what is of far greater importance, a son who inherited his father's genius, under more favourable auspices for its early development, and who unquestionably ranks in the first class of the scientific men of his day. (A.)

Herschel, the name by which the French, and most other European nations, call the planet discovered by Dr Herschel in the year 1781. The Italians call it Uranus, and the British Georgium Sidus.

HERSE, in *Fortification*, a lattice, or portcullis, in the form of a harrow, beset with iron spikes. The word *herse* is French, and literally signifies *harrow;* being formed of the Latin *herpex* or *irpex*, which denotes the same thing. It is usually suspended by a rope fastened to a moulinet, to be cut, in case of surprise, or when the first gate is broken with a petard, that the herse may fall, and stop up the passage of the gate or other entrance of a fortress.

HERSFELD, a province of the principality of Hesse Cassel, in Germany, extending over 156 square miles, on an elevated plain, but watered by the river Fulda. It contains one city, one market-town, and sixty-two villages or hamlets, with 2885 houses, and about 19,000 inhabitants. The chief city, of the same name, is situated on the river Fulda, and is an open town, which was burnt by the French on their retreat from Leipsic, but has been since rebuilt. It contains 433 houses, and 5220 inhabitants, chiefly linen weavers and bleachers.

HERSILLON, in the military art, a sort of plank or beam, ten or twelve feet in length, two sides of which are driven full of spikes or nails, to incommode the march of the infantry or cavalry. The word is a diminutive of *herse;* the hersillon doing the office of a little herse.

HERSTAT, a town of the Netherlands, in the province of Liège, on the left bank of the Meuse. It is a place in which there are very large iron works, and near to it is abundance of coals. It contains 4710 inhabitants, chiefly employed in making ironmongery.

HERTFORD, a town, the capital of the county of the same name, twenty-one miles from London, on the river Lea. It is supposed to have been a town as early as the time of the Britons. The Saxon kings held their court at this place; and Alfred, to check the irruptions of the Danes, constructed a castle, the remains of which are still to be seen. It is a corporate town, governed by a mayor or high steward, a recorder, and nine aldermen, and two members are returned to parliament. Christ Hospital in London has here a branch of its establishment, in which 400 boys and sixty girls are educated. There are two parish churches, and several places of worship for the different dissenters from the establishment. The assizes and sessions being held here, brings some trade to the town; and there is a good market on Saturday, at which much corn, especially barley, is sold. The chief trade consists in converting barley into malt for the great breweries in the metropolis. The inhabitants amounted in 1801 to 3360, in 1811 to 3900, in 1821 to 4265, and in 1831 to 5247.

Hertford College. The design of this institution is to train up and qualify a race of youths, for filling in succession the various and important offices of government in our Indian empire. "To dispense justice to millions of people of various languages, manners, usages, and religions; to administer a vast and complicated system of revenue, through districts equal in extent to some of the most considerable kingdoms in Europe; to maintain civil order in one of the most populous and litigious regions in the world; these," says Marquis Wellesley, "are now the duties of the larger portion of the civil servants of the Company. The *senior merchants*, composing the courts of circuit and appeal under the presidency of Bengal, exercise in each of these courts a jurisdiction of greater local extent, applicable to a larger population, and occupied in the determination of causes infinitely more intricate and numerous, than that of any regularly constituted courts of justice in Europe. The senior or junior merchants employed in the several magistracies and courts, the writers or factors filling the stations of registrars, and assistants to the several courts and magistrates, exercise, in different degrees, functions of a nature purely judicial, or intimately connected with the administration of the police, and with the maintenance of the peace and good order of their respective districts." The marquis points out, in the same strong manner, the arduous duties of the several departments which the Europeans are required to perform in India; and sums up by saying, "that the civil servants of the East India Company can no longer be considered as the agents of a *commercial concern;* they are in fact the ministers and officers of a *powerful* sovereign; they must be viewed in that capacity with a reference, not to their nominal, but to their real occupations. They are required to discharge the functions of magistrates, judges, ambassadors, and governors of provinces, in all the complicated and extensive relations of those sacred trusts and exalted stations, and under peculiar circumstances, which greatly enhance the solemnity of every public obligation, and the difficulty of every public charge. Their duties are those of statesmen in every other part of the world; with no other characteristic differences than the obstacles opposed by an unfavourable climate, a foreign language, the peculiar usages and laws of India, and the manners of its inhabitants."

The system of education adopted holds a due medium between the strictness of our public schools and the laxity of the English universities. Upon being appointed, each youth must undergo an examination in Greek and Latin, and arithmetic, before the principal professors. This previous examination at once prevents persons from offering themselves who have not received the usual school education of the higher classes of society; and those who offer themselves, and are found deficient, are remanded till another period of admission. The lectures of the different professors in the college are given in a manner to make previous preparation necessary, and to encourage most effectually habits of industry and application. In their substance they embrace the important subjects of Classical Literature, the Oriental Languages, the elements of Mathematics and Natural Philosophy, the Laws of England, General History, and Political Economy.

On all the important subjects above enumerated, examinations take place twice in the year. These examinations are conducted upon the plan of the great public and collegiate examinations in the universities, particularly of Cambridge, with such improvements as experience has suggested. The questions given are framed with a view to ascertain the degree of progress and actual proficiency in each particular department on the subjects studied during the preceding term; and the answers, in all cases which admit of it, are given in writing, in the presence of the professors, and without the possibility of a reference to books. After the examination in any particular department is concluded, the professor in that department reviews, at his leisure, all the papers that he has received, and places, as nearly as he can, each individual in the numerical order of his relative merit, and in certain divisions implying his degree of positive merit. These arrangements are all subject to the control of the whole collegiate body. They require considerable time and attention, and they are executed with scrupulous care and strict impartiality.

The course of study continues two years, and commences at such an age that the students may be qualified to proceed to India by the time they are eighteen or nineteen years old; and having begun the study of the oriental languages, they are prepared to prosecute them in Calcutta, so as to proceed to their official appointments by the time they have attained the age of twenty or twenty-one.

Hertfordshire.

HERTFORDSHIRE, an inland English county, of great riches, derived principally from its vicinity to the metropolis of the British empire. It is bounded by Essex on the east, by Bedfordshire and Cambridgeshire on the north, by Buckinghamshire on the west, and by Middlesex on the south. Its extreme length is thirty-eight miles, and its greatest breadth twenty-eight miles. Its area is about six hundred and twenty square miles. It is divided into eight hundreds, and contained seventeen towns, 134 parishes, and 20,781 houses, at the time of the last survey.

The population, at the four decennial censuses, has been found to amount in 1801 to 97,577, in 1811 to 111,654, in 1821 to 129,714, and in 1831 to 143,300. Of these, the occupiers of land employing labourers were 1518, the occupiers of land not employing labourers 1679, labourers employed in agriculture 1470, those employed in manufactures 290, capitalists, bankers, &c. 1429, labourers not agricultural 2410, other males twenty years of age 1521, male servants 725, female servants 5512.

It is generally a level district, with gentle undulations, no part rising to the height of mountains, though Kingsworth Hill, the most elevated spot, is nine hundred feet above the level of the sea. Though beautifully diversified with ornamented woods, there are no extensive tracts of forest land. The intermixture of pasture and arable fields with the great number of gentlemen's seats, the pleasing rivulets and the shady hedges, give it a peculiar character of beauty. Notwithstanding the deficiency of forests, the abundance of trees, especially oaks of ancient growth, which the hedge-rows and parks display, gives a richness to the scenery which is not surpassed by that of any county in England.

The rivers of Hertfordshire are, *first*, the Lea, which rises in Bedfordshire, enters this county at Hide-mill, and passes by Ware to Hertford, where it becomes navigable. Near Hoddesdon it forms a junction with the Stort, and at length falls into the Thames a little below London. The Stort is navigable to Bishops Stortford, at the extremity of the county. In its course it receives the waters of the smaller streams of the Rib, the Quin, the Beane, the Maran, and the Kime. *Secondly*, the Colne, which rises on the borders of Middlesex, passes through the western part of the county, and falls into the Thames at Brentford. It receives in its course the Gade, the Bulborne, and the Ver or Meuse. This river, in some parts of its course, forms a part of the Grand Junction Canal for several miles, and, afterwards separating from it, continues its course in a parallel direction till it reaches its mouth. *Thirdly*, the Ivel, a river composed of the inferior streams of the Oughton, the Iliz, and the Pirral. These, when united, pass into Bedfordshire, and at length reach the German Ocean. The river formed by artificial means to supply the metropolis with fresh water, and called the New River, has its sources in various springs in the vicinity of Ware, and is rendered more copious by borrowing water from the river Lea, whose course is parallel to it for many miles. The New River enters Middlesex before it reaches the reservoir, from which by means of pipes it is distributed to the different houses of the metropolis. That extraordinary work, the Grand Junction Canai, passes through a great part of this county in its progress from its union with the other canals to its termination in London.

In almost every part of this county the subsoil is calcareous, consisting of two species, one a pure chalk, the other of a softer kind, mixed with portions of whitish clay, and provincially called marine. The superior soil does not contain any great varieties of species. It is generally a clayey loam, in some parts highly tenacious, and retentive of moisture; on the higher grounds it is frequently mixed with many surface stones. There are some sandy loams intermixed with gravel, and others with clay. Some of the parts on the side of Essex are very wet, and require expensive draining, as well as copious quantities of manure, to render them fruitful. In the neighbourhood of North Mims and Hatfield the soil is very sterile, mixed with many springs of a sulphureous or ferruginous nature, and only rendered productive by expensive improvements. Near Baldock, Hitchen, and King's Walden, the upper soil is of a chalky nature, occasionally mingled with other earths, but generally rather poor.

The greater part of Hertfordshire is a corn-bearing country. The proportion of meadow land, or good pasture, is very small, if those parts are excepted which are contiguous to the numerous gentlemen's seats with which the county abounds. There are indeed some very rich pastures on the banks of the river Stort, which extend from Hertford to Hockeril, on the borders of the river Lea, and near Rickmansworth, where they are watered by the Colne. The whole of the meadow land is susceptible of great improvement by irrigation; but the vicinity to the metropolis makes the streams of water so valuable to turn mills, that little of their contents can be afforded to assist agriculture. The rotation of crops on the arable lands is very various, as may be supposed where the soil is so different. The most common course is turnips, barley, clover, wheat, and oats. In the districts where the soil is of a more tenacious consistence, fallows are very generally used for a whole year, and followed by barley, clover, wheat, and peas or beans. The average quantity of wheat sown is two bushels and a half to the acre; of barley, from three and a half to four bushels; and of oats, from four to five bushels. The average produce is, wheat from twenty-three to twenty-five bushels, barley thirty-two, and oats from thirty-eight to forty.

The drill husbandry is very partially introduced, and, from the nature of the soil, does not appear very likely to make any very rapid or extensive progress. It is found beneficial for pulse crops; but its superiority for barley, wheat, and oats, does not appear to be generally recognised. The ploughs now commonly used are small, and have almost superseded the use of the great Hertfordshire ploughs, which required four strong horses to use them with effect. In a great part of the country oxen are used in the plough, and frequently in the waggons; in the latter case they are shod with light iron shoes.

The principal cause of the productiveness of this county arises from its vicinity to the metropolis, and the facility with which abundance of the substances adapted to improve the soil can be furnished, by means of the water carriage, which is extensive. On the land, below the surface, chalk is everywhere found; and this, laid on at the rate of a hundred cart-loads to the acre, improves the heavy lands in a wonderful degree; but the manures brought as back carriage by the barges from London are diffused and applied in a very liberal manner. Soot is spread at the rate of thirty or forty bushels to the acre, ashes from fifty to one hundred bushels to the acre, and ground bones from four to five chaldrons, on the same extent of land. For the pastures, burnt bones are deemed preferable, but for arable land they are merely boiled and crushed. Oil-cake, peat-ashes, hair, woollen rags, and other substances, are much employed. In addition to these, the use of the sheep-fold, and the application of farm-yard dung, are as universal as in any part of the island.

In the south-west part of the county there are many orchards of apples and of cherries; the former the most considerable and the most profitable to the growers, from being less expensive to gather, and bearing carriage to London better than cherries. The cherry trees are in full bearing after being planted ten years, and on an average yield about six hundred pounds of cherries annually.

They are usually inferior to those of Kent, and sell for much less in the markets. Each cherry tree is usually allowed nine square perches of ground. The size of the orchards, whether for apples or cherries, is usually four or five acres.

As this is a corn country, less attention is paid to the breeds of cattle than in some others. The cows are either of the Welsh, Devon, Suffolk, or Herefordshire races; the Suffolk breed is generally preferred. The sheep are mostly breeding ewes of the South Down or Wiltshire kind; the former are deemed the most profitable. Of late a species of sheep, from crosses between those of Leicestershire and those of the Cotswold Hills, has been extensively and beneficially propagated. Oil-cake is very extensively used for feeding sheep. The horses commonly employed for agricultural purposes are of the Suffolk kind; for their sustenance, as well as for that of sheep and cows, great tracts of land are cultivated with both kinds of tares, and with clover.

The landed property in Hertfordshire is so much divided that there are few great proprietors, and none so large as in many other counties; few rentals of individuals exceed L.3000 per annum. A large portion of the county is copyhold tenure, with fines in some instances fixed, and in others, such as the lords of the manors and the copyholders can agree upon. The farming buildings are generally neat, convenient, and substantial.

Though principally an agricultural county, yet Hertfordshire has several manufactures which give employment to the poor. In the western and northern part of the county the making of thread-lace gives occupation to the females. On the side towards Bedfordshire the plaiting of straw to make hats employs considerable numbers both of women and children. There are silk mills at St Albans, and mills for spinning cotton at Rickmansworth. Some of the finest writing paper is made at Two-waters by mills on the Colne and the Bulborne. Great quantities of malt are made at Ware, Hertford, Bishops Stortford, and other parts of the country; and the makers of it, as well as the numerous millers, have the advantage of water conveyance to the metropolis. As little wood is used for firing, the barges that convey malt and flour to London bring back coals, or, when they are not wanted, are loaded with manure. These articles form the principal trade of the county.

A portion of the children of Christ Hospital, in London, are sent to Hertford at an early period of their entrance on that foundation. The building appropriated for this purpose forms three sides of a triangle, at the east end of the town, and contains apartments for 500 children, their master, and attendants.

This county abounds with many antiquities. The most striking is the Abbey of St Albans, a most beautiful Gothic pile, said to have been founded in honour of the first British martyr, in the year 303, upon the site of the ancient Verulam. The vicinity of this abbey was the theatre of many bloody battles during the wars of the rival houses of York and Lancaster. Lord Bacon was buried, not in the abbey, but in St Michael's Church, near it, where his monument is still in good preservation. The ruins of Sopwell Nunnery, near St Albans; the remains of Gorhambury Abbey; the Roman Camp at Ravensborough; the Cross at Waltham; the church at Kings Langley; and the castles of Anstey, of Bennington, of Hertford, and Bishops Stortford, all invite and gratify the attention of the antiquary.

By the law of 1832 this county returns three members to the House of Commons; the number of voters is about 4200; and the polling places are Hertford, Stevenage, Buntingford, Bishops Stortford, Hoddesdon, Hatfield, and Hemel Hempstead. The two boroughs Hertford and St Albans return, as before, two members each.

The principal towns and their population are, Hertford, 5247; St Albans, 4772; Hitchen, 5211; Ware, 4214; Hemel Hempstead, 4759; Rickmansworth, 4574; Bishops Stortford, 3958; Watford, 2960; Berkhampsted, 2819; Standon, 2272; Tring, 3488.

HERTHA, or Herthus, in *Mythology*, a deity worshipped by the ancient Germans, and mentioned by Tacitus, in his book *De Moribus Germanorum* (c. 40). Vossius conjectures, that this goddess was Cybele; but she was more probably Terra, or the Earth, because the Germans still use the word *hert* for the earth, whence also the English word *earth*.

HERVEY, James, a divine of the church of England in the eighteenth century, and a writer of great popularity amongst a certain class of persons, was born at Hardingstone in the year 1714. He was educated at the free grammar school of Northampton, where he acquired a competent knowledge of the Greek and Latin languages; and in 1731 he was sent to the university of Oxford. The first two or three years of his residence at that seminary were spent, we are told, without serious application to study, and therefore without making much improvement; but afterwards becoming acquainted with those who zealously studied what they called primitive Christianity, and who were afterwards termed *Methodists*, he became strongly attached both to piety and to learning. Independently of his other studies, he learned anatomy from Dr Keil, and natural philosophy from Dr Derham's Physico and Astro-theology; and by the perusal of Mr Spence's essay on Pope's Odyssey, he improved his style. He attempted the Hebrew without a teacher, but afterwards relinquished the study in despair; he resumed his labours, however, and in time became a tolerable proficient in that language. In the year 1740 he was appointed curate of Biddeford in Devonshire, where he had only L.60 a year, including a stated collection made by his friends. Upon the death of the rector he was dismissed by the new incumbent, contrary to the earnest expostulation of the parishioners, who offered to maintain him independently of the rector. In 1743 he became curate to his father, who held the living of Weston Favell in Northamptonshire, and continued in that station till 1750, when his health was rapidly declining. Having been induced to repair to London for change of air, he continued about two years in the metropolis, when he was recalled to Weston Favell to succeed his father. He obtained the livings of Weston and Collingtree in the same neighbourhood, and in 1752 took his degree of master of arts. He attended to the duties of both parishes alternately with a curate, in the discharge of which he was fervent and indefatigable. So great were his exertions, indeed, that he brought on a decline, accompanied with incessant cough and acute pains, all which he supported, not only with fortitude, but without a single expression of peevishness, and died without a groan on the 25th of December 1758, at the age of about forty-four. His piety was ardent and sincere, although in the estimation of some judges he was rather enthusiastic. He was a man of unblemished moral deportment; his temper was disinterested, and he was humble without the affectation of humility. To society he was just and punctual, and candid to people of every description. The L.700 which he received for his *Meditations* were applied to the relief of the indigent and distressed. He was so rigid a Calvinist, that whenever he spoke of imputed righteousness, he became almost an Antinomian. His erudition was respectable, but not such as to place him amongst scholars of the first rank, although he seems to have been well acquainted with the classics. Many persons have admired the style of his writings; but competent judges must pronounce it as by far too flowery and diffuse to be termed elegant, and regard it as equally destitute of vigour and simplicity. The writings of Hervey are, 1. Meditations and Contemplations, 1746, 8vo; 2. Contemplations on the Night and Starry

Heavens, 1747, in 8vo; 3. Remarks on Lord Bolingbroke's Letters on the Study of History, so far as they relate to the History of the Old Testament, 1753, in 8vo; 4. Theron and Aspasio, or a series of Dialogues on the most important Subjects, 1755, in three vols. 8vo; 5. Sermons, 1759; 6. An Edition of Jeuk's *Meditations;* 7. A Preface to Burnham's *Pious Memorials*, 1753, in 8vo; 8. Eleven Letters to Wesley; 9. Letters to Lady Francis Shirley, 1782, in 8vo. All these are included in the edition of his works in six vols. 8vo, published by the Rivingtons; but, in 1811, there appeared, for the first time, what may be considered as a seventh volume, consisting of Letters, illustrative of the author's amiable character, and of many circumstances in his early history.

HERZBERG, a town of the kingdom of Hanover, the capital of a bailiwick of the same name, in the province of Grubenhagen, on the river Sieben. It stands at the foot of the Hartz Mountains, and contains 321 houses, with 2720 inhabitants, employed in cotton and linen weaving, and in making paper.

HESBIN, a city of France, in the arrondissement of Montreuil, and department of Calais. It stands at the junction of the river Canche with the Ternaise, in a marshy situation, and is strongly fortified. It contains 938 houses, and 4160 inhabitants, who produce hosiery and cotton goods, and have some twist mills. Long. 2. 3. E. Lat. 50. 22. N.

HESIODUS *of Ascra*, a celebrated poet, the son of Dius and Pycimede, of whose life and character history has left us very few particulars on which dependence can be placed. His father was a native of Cumæ, in Æolis, where he seems to have lived in the greatest indigence. Anxious to improve his circumstances, he emigrated with his son Perses to Ascra, a small village of Bœotia, at the foot of Mount Helicon, and there it would appear that Hesiod was born. The early years of the poet were spent in the mountains of Bœotia, in the humble capacity of a shepherd; and how he acquired the learning which he displays in his poetry, we have no means of discovering. On the death of his father, he engaged in a law-suit with his brother respecting the property left by his father; and he speaks with great contempt and bitterness of the dishonest conduct pursued by the judges of Ascra. They gave judgment against him, and in consequence of this he left his native city. He probably retired to the country of the Locri Ozolæ, where, at last, he met with a tragical end. It so happened that Demodes of Miletus, a friend of Hesiod, ill treated Climene, the daughter of the Locrian with whom Hesiod was residing; and as her brothers Amphiphanes and Ganyctor believed the poet to be accessory to, if not an active partner in, the disgraceful transaction, they put him to death on the spot where they overtook him. Hesiod had been ordered by an oracle to avoid Nemea, as likely to prove fatal to him, which the poet naturally imagined to allude to the city of that name in the Peloponnesus; but the true meaning of the oracle was discovered by his being slain in the portico of the temple of the Nemean Jupiter, near Œneon, within the territory of Naupactus. His body had been thrown into the sea, but being recovered in an extraordinary manner, was buried within the precincts of the temple. It was afterwards transferred to Orchomenos by order of an oracle, to avert a plague which afflicted the inhabitants of that city.

The period during which he flourished was a point disputed by the ancients, and we have no facts of a later date which can enable us to come to a correct conclusion. He is described by Herodotus as contemporary with Homer; and this must have been the tradition followed by the author of the contest between Hesiod and Homer, in which the former is supposed to gain the victory. Velleius Paterculus represents him as having lived more than a century after Homer, whilst others have endeavoured to prove that he preceded that poet.

Of the numerous works attributed to Hesiod only three have been preserved, and these not in the most perfect state. The Works and Days is considered as the most valuable, not so much from its own intrinsic merit, as from having suggested to Virgil the idea of the Georgics; and to it also we are indebted for the description of the five ages, and the fable of Pandora. It contains at the beginning a collection of moral maxims and wise saws, and then proceeds to give some superficial hints on agriculture, on the proper season for each work, and on the construction of vessels; it closes with many puerile observations, and with an account of some superstitious practices. This was the only work of Hesiod which the Bœotians allowed to be authentic, and it was regarded with such veneration that they had it engraved on a leaden tablet, which they showed to Pausanias. The *Theogonia* is a didactic poem on the generation of the gods, and is curious as being the most ancient account of the Greek mythology. To it we probably owe the Metamorphoses of Ovid. The *Aspes* of Hercules contains an account of a battle between that hero and Cycnus, and derives its title from the shield having been made by Vulcan. It is ascribed to Hesiod by Athenæus, though probably without any sufficient reason. There are many other works quoted by the ancients, but not even a fragment of them has been preserved. Many editions of the works of Hesiod have been published, but the best are those of Gaisford, Oxford, 1814–1820; Dindorf, Leipsic, 1825; and Gottlingius, Gotha, 1831.

HESIONE, a daughter of Laomedon, king of Troy, who was exposed to a sea monster which had been sent by Neptune to ravage the coast of Troy, as a punishment to the king for having defrauded the god of his stipulated reward. Hercules, who was then accompanying the Argonauts, delivered the princess, slew the monster, and received as a reward six beautiful horses. Besides, Hesione from gratitude agreed to follow him. He left the princess and the horses with Laomedon till he should return from the expedition. When Hercules sent his friend Telamon to reclaim his property, Laomedon refused to give them up. Incensed at this treachery, the hero laid siege to Troy, killed the perjured king, carried off Hesione, and gave her in marriage to Telamon.

HESPER, HESPERUS, in *Astronomy*, the evening star; an appellation given to Venus when she follows or sets after the sun. The word is formed from the Greek 'Εσπερος, and is supposed to have been originally the proper name of a man, brother of Atlas, and father of the Hesperides.

HESPERIDES, nymphs who possessed a garden, in which grew the golden apples given by Jupiter to Juno on the day of her marriage. They were Ægle, Erythia, Vesta, and Arethusa. The garden was guarded by a dragon called Ladon, and is generally placed near Mount Atlas in Africa. It was one of the labours of Hercules to procure some of these apples. He persuaded Atlas to go in search of them, whilst he sustained the burden of the heavens on his shoulders. On his return with the apples, Hercules expressed a wish to ease his head by placing something on it, and when Atlas assisted him to remove this inconvenience, Hercules artfully left the burden, and seized the apples. According to others, Hercules slew the dragon and gathered the apples himself, without the assistance of Atlas. According to Diodorus, they were the same as the Atlantides, being called Hesperides from their mother Hesperis, the wife of Atlas; and they were the keepers of flocks of sheep, the Greek word μηλον signifying either a *sheep* or an *apple*.

HESPERIDUM INSULÆ, in *Ancient Geography*, islands near the *Hesperi Cornu*; but the accounts of them are so much involved in fable, that nothing certain can be affirmed respecting them.

HESPERUS, in fabulous history, son of Cephalus by Aurora, was changed into a star, called *Lucifer* in the morning, and *Hesperus* in the evening.

HESSE, a principality in Germany, commonly distinguished by the name of Hesse-Cassel. It was formerly a landgraviate, but, by the extinction of the Germanic empire, it lost that title, and the sovereign is now only called the prince or crown prince (*Kurfurst*). It is comprehended between long. 8. 26. and 9. 26. east, and lat. 49. 56. and 52. 26. north. The boundaries are, on the north-west the Prussian province of Westphalia; on the north-east the kingdom of Hanover; on the east the Prussian province of Saxony, the duchy of Saxe-Weimar, and the kingdom of Bavaria; on the south-east Bavaria; on the west Hesse-Darmstadt and the territory of Frankfort; and on the south-west Darmstadt and Waldeck. It extends over 4556 square miles, and has been recently divided into four provinces.

Provinces.	Extent in Square Miles.	Population.
Lower Hesse......	2156	296,410
Upper Hesse......	902	106,942
Fulda..............	904	121,957
Hanau..............	594	104,600
	4556	629,909

It contains 95 cities and towns, 1112 villages, and 95,666 houses. The largest cities and their populations are as follows:—

Cassel....................	26,342
Hanau.....................	13,792
Fulda.....................	9,266
Marburg..................	7,640
Hersfeld.................	6,144

The reigning family profess the Reformed or Calvinistic religion, and the greater part of the inhabitants adhere to that sect. In 1812 they were found to be 330,000 Reformed, 140,000 Lutherans, 90,000 Catholic, and the remainder Jews, Menonites, and Herrnhutters.

The institutions for education are inferior to those of any other state in Germany. There is a university at Marburg with no less than thirty-four professors, and only 200 students, and a lyceum at Cassel. There are grammar schools in some of the other cities, and a seminary for educating Catholic priests at Fulda. The whole of the territory is rather hilly, and towards the south may almost be described as mountainous; but it is watered by abundant streams, which flow in plains, the descent to which, from the hills, is very gradual, and thus forms extensive and moderately fruitful valleys. The several smaller rivers contribute their portion of waters to form the greater rivers; the Weser, which runs to the sea by Bremen; and the Maine and the Lahn, which fall into the Rhine.

The agriculture of the territory is far inferior to that of the adjoining provinces of Hanover, Brunswick, and Prussian Saxony. The number of cattle, and the consequent supply of manure, are in a low state, and recourse is had to fallows every third year. Though almost the whole population are occupied in cultivation, scarcely sufficient corn, though aided by potatoes, is grown for the inhabitants. Some wine is made in the province of Hanau, and in Isenburg. Hemp is raised in Hanau, and flax in a greater or less degree in each of the provinces. These two articles, with the wood from the forests, form the chief articles of export, which also in part consist of honey and wax. There are some mines of copper, in which silver is found; some productive mines of cobalt and iron are also worked, and, by means of coal, which is likewise at hand, supply the necessary demand for utensils. The manufactures are very inconsiderable, except for domestic uses. Coarse linens, called Hessens, were formerly sent to England for packing cloths, but of late years that trade has ceased. In Cassel and Hanau there are workmen in gold, silver, and jewellery; in cutlery, paper, snuff, glass, pottery, and other branches of industry, but solely for internal consumption.

The prince is the sole executive governor, and promulgates the laws without the aid or assent of the states, who meet rather for form than for business. The annual revenues of Hesse-Cassel amount to L.450,000 sterling, of which about L.65,000 arises from the patrimonial estates of the sovereign. The expenditure is not accurately known, but it is estimated, including the interest of the debt, to be somewhat beyond the income. The amount of the national debt is about L.200,000, but the several provinces have also their respective debts. There is a sinking fund for the gradual discharge of the debts.

The standing army, formerly of 30,000 men, is reduced to the following state: 7000 infantry, 1315 cavalry, 670 artillery, 200 invalids in garrisons. The contingent of the state to the confederation is 5679 men. The accessions to this state, since the peace of Luneville in 1801, have amounted, after the cessions made in exchange, to 720 square miles; and it is now of nearly double the extent which it contained when the house of Hesse was divided into the two branches of Cassel and Darmstadt in 1567.

HESSE-DARMSTADT, a grand duchy of Germany. This dominion is not compact, but consists of two portions of nearly equal extent, and of several smaller detached parts, and is on both sides the river Rhine. The southern portion is bounded on the north-west by Nassau, on the north by Frankfort and Hesse-Cassel, on the north-east and east by Bavaria, on the south by Baden, on the south-west by Bavaria, and on the west by Prussia. The northern portion, some parts of which are separate from the others, is enclosed in the territory of Waldeck and of Nassau, and some are surrounded by Prussia, whilst others are in contact with Frankfort and with Hamburg. The whole extent is 4070 square miles, and it is divided into the following provinces, viz.

Provinces.	Extent in Square Miles.	Population.	Capitals.
Starkenburg....	1430	247,152	Darmstadt.
Rhenish Hesse.	550	177,721	Mayence.
Upper Hesse...	2090	273,028	Giessen.
	4070	697,901	

According to the returns of 1826, the duchy contained 97 cities, 56 market-towns, and 2136 villages, with 99,203 houses. The religious denominations in 1822 were: Lutherans 391,185, Catholics 157,792, Calvinists 108,255, Jews 14,982, and Menonites 986. Although the population has greatly increased since that date, the proportion of the several sects to each other is not supposed to have been altered, the numbers of the clergy continuing the same, viz. 686 Lutherans, 166 Catholics, and 126 Calvinists. This is one of those states the territory of which has been augmented by the events of the revolutionary wars, having increased between the peace of Luneville in 1801 and the year 1816, to more than double its former extent.

Hesse-Darmstadt.

The whole of the territory is rather mountainous. None of the elevations, however, exceeds 2000 feet; but in the southern division, where the majestic Rhine breaks through the land, there are on both its sides extensive plains, rich and fertile, and in the northern part, near the Maine, some moderately large valleys. It is generally a well-watered country. Its streams empty themselves into the sea by the Rhine and the Weser. The first of these rivers receives the waters of the Pfrim, the Selze, the Nahe, the Neckar, the Maine, and the Lahn; the latter only the streams of the Altfell, the Schwalm, and the Eber. Few districts of the same extent have a greater variety of climate. In the neighbourhood of the Rhine and the Maine it is mild and agreeable, the winter is short, the summer warm, and the air generally dry. The hay harvest begins early in June, the corn harvest in the middle of July, and the vintage in the latter part of September. On the Odenwald, on the other hand, the climate is raw and cold, the spring begins later, and the fruits ripen several weeks later.

Considering that the ancient rotation of a fallow succeeded by two corn crops is commonly adhered to, the land is productive of corn; but rye is the greatest crop in extent, though some good wheat is grown. Fruit is very abundant, but in general little selection is made of the best kinds of each. Apples, pears, plums, almonds, and chestnuts abound. Wine is, next to corn, the most important production, and the annual value of what is raised is estimated to amount to about half as much as that of the grain. The breeds of cattle present nothing remarkable; the cows are tolerable, the sheep not numerous, and the horses rather few; no pains being taken to improve the races. Wood is an important article, because it can be easily conveyed from the forests by the Maine and the Rhine to the great market for that commodity in Holland.

The mineral wealth consists of the produce of some iron and copper mines, in the latter of which cobalt is found; but the quantity of these articles is insufficient for the consumption. The manufactures of Hesse-Darmstadt consist chiefly in working up the raw materials of wool, flax, and iron, into articles for internal consumption; and, besides these, there are small establishments for making paper, glass, copper, and iron; whilst the people in the more barren parts are industrious and ingenious in making a variety of toys and wood utensils.

The chief articles of export are winter and summer barley, wine, tobacco, rape oil, dried fruits, madder, clover-seed, wood, honey, wax, and feathers. These are given in exchange for colonial goods, generally conveyed from the ports of Holland, and in articles of dress and furniture, brought from France or from the Netherlands.

Education is well attended to. In the university of Giessen there are 480 students; there is a medical school at Mayence, and a gymnasium in Darmstadt, Mayence, and Worms, and village schools in all parts, excepting on the west bank of the Rhine, which was so long possessed by the French.

The government is hereditary: the grand duke is addressed as his Royal Highness, and till 1820 was an unlimited sovereign. In that year a representation was introduced, divided into two chambers, who concur with the sovereign in the formation of new laws.

The revenues of the state amount to L.587,600 sterling, of which domains and royalties of the prince yield L.150,000, and the remainder is derived from direct and indirect taxes. The expenses, including interest on the public debt, are nearly equal to the income. The debt is about L.1,430,000, and the interest on it is L.68,190. The army consists of 1380 cavalry, 5880 infantry, 650 artillery, and 660 gens-d'armes, in all 8421. The contingent which Hesse-Darmstadt is bound to furnish to the Germanic confederation is 6195 men.

Hesse-Homburg, a small independent principality in Germany, under the government of a prince of the family of Hesse-Darmstadt. Towards the west it is bounded by the territory of Nassau, but on all the other sides by that of Hesse. It has, however, a part of its possessions to the west of the Rhine, surrounded by the provinces of Prussia, of Bavaria, and of Lichtenburg. The whole extent of both divisions is 170 square miles. It contains three cities or towns, thirty villages, twenty-seven hamlets, with 3250 houses, and 20,400 inhabitants, of whom 12,700 are Calvinists, 5500 Lutherans, 2050 Catholics, and a few Jews. It is divided into two provinces, viz. Homburg on the east, and Meisenheim to the west of the Rhine. The latter is the largest division. They are both well cultivated, and yield a surplus of corn, wool, flax, and wood; and Meisenheim grows some good wine, and has coal-pits, by which it is enabled to carry on some manufactures of glass and of ironmongery goods. The revenues of the state amount to about L.18,000 sterling, besides some estates of the sovereign, of L.3500, arising from private estates in the Prussian province of Saxony. The debt of the state is about L.45,000, which is gradually lessening. Homburg furnishes a contingent of two hundred men to the general confederation. Homburg, the capital, and the residence of the prince, is situated on the river Eschbach, and is overlooked by the palace, from whence is a most extensive prospect. It contains a church for each of the religious sects, and a synagogue for Jews, with 388 houses, and 2964 inhabitants, who find occupation in making flannels, linen goods, and hosiery, and in supplying fruit to the market of Frankfort.

HESTON, a parish in the hundred of Islesworth, of the county of Middlesex, ten miles from London, the chief part of which consists of the town of Hounslow, through which the great roads to the western counties pass. The inhabitants amounted in 1801 to 1782, in 1811 to 2251, in 1821 to 2810, and in 1831 to 3407.

HESYCHIUS, the most celebrated of all the ancient Greek grammarians whose works are now extant, was a Christian; and, according to some, the same with Hesychius, patriarch of Jerusalem, who died in the year 609. He wrote a Greek lexicon, which, in the opinion of Casaubon, is the most learned and useful work of that kind produced by the ancients. Schrevelius published a good edition of it in 1668, in 4to, with notes; but the best is that of John Alberti, printed at Leyden in 1746, in two vols. folio.

HETERIARCH, Hetæriarcha, in *Antiquity*, an officer in the Greek empire. There were two kinds of heteriarchs; the one simply so called, and the other denominated *great heteriarch*, who had the direction of the former. The principal function of these officers was to command the troops of the allies.

HETEROCLITE, in *Grammar*, an irregular or anomalous word, which, either in declension, conjugation, or regimen, deviates from the ordinary rules of grammar. The word is Greek, ἑτεροκλιτον, formed from ἑτερος, *alter*, another, different, and κλινω, I decline. Heteroclite is more peculiarly applied to nouns which vary or are irregular in point of declension.

HETERODOX, in *Polemical Theology*, something which is contrary to the faith or doctrine established in the true church. The word stands in opposition to *orthodox*.

HETEROGENEITY, in *Physics*, the quality or disposition which renders a thing *heterogeneous*. The word is also used for the heterogeneous parts themselves; in which sense the heterogeneities of a body are the same thing with its impurities.

HETEROGENEOUS, or Heterogeneal, literally imports something of a different nature, or which consists of parts of different or dissimilar kinds; in opposition to *homogeneous*.

HETEROGENEOUS *Light* was defined by Sir Isaac Newton to be that which consists of rays of different degrees of refrangibility. Thus the common light of the sun or clouds is heterogeneous, being a mixture of all sorts of rays.

HETEROGENEOUS *Nouns*, one of the three variations in irregular nouns, or such as are of one gender in the singular number, and of another in the plural. Heterogeneous nouns, under which are comprehended mixed nouns, are sixfold: 1. Those which are of the masculine gender in the singular number, and neuter in the plural; as, *hic Tartarus, hæc Tartara:* 2. Those which are masculine in the singular number, but masculine and neuter in the plural; as, *hic locus, hi loci et hæc loca:* 3. Such as are feminine in the singular number, but neuter in the plural; as, *hæc carbasus, et hæc carbasa:* 4. Such nouns as are neuter in the singular number, but masculine in the plural; as, *hoc cœlum, hi cœli:* 5. Such as are neuter in the singular, but neuter and masculine in the plural; as, *hoc rastrum, hi rastri, et hæc rastra:* And, 6. Such as are neuter in the singular, but feminine in the plural number; as, *hoc epulum, hæ epulæ*.

HETEROGENEOUS *Quantities* are those which are of such different kind that one of them, taken any number of times, never equals or exceeds the other.

HETEROGENEOUS *Surds* are such as have different radical signs: as $\sqrt{aa}$, and $\sqrt[3]{bb}$; $\sqrt[5]{9}$, and $\sqrt[7]{19}$.

HETEROSCII, in *Geography*, a term of relation, denoting such inhabitants of the earth as have their shadows falling but one way.

HETRURIA. See ETRURIA, and ETRUSCANS.

HETTOWRA, a town of Hindustan, in the Napaul territories, and the centre of all commerce carried on between the Napaul dominions and those of Oude and the Company. It is situated on the Rapti river, and is a miserable village, consisting only of about sixty houses. Long. 85. 22. E. Lat. 27. 14. N.

HEUSDEN, a city of the Netherlands, in the province of North Brabant. It is strongly fortified, commands the navigation of the river Maas, and contains 280 houses, with (in 1830) 1834 inhabitants.

HEVELIUS, or HEVELKE, JOHN, an eminent astronomer, was born at Dantzig on the 28th of January 1611. He studied in Germany, England, and France, and everywhere obtained the esteem of the learned. He was the first who discovered a kind of libration of the moon, and made several important observations on the other planets. He also discovered several fixed stars, which he denominated the *Firmament of Sobieski*, in honour of John III. king of Poland. His wife was also skilled in astronomy, and made part of the observations published by her husband. In 1673 he published a description of the instruments with which he made his observations, under the title of *Machina Cœlestis*, and in 1679 he published the second part of this work; but in September the same year, whilst he was at a seat in the country, he had the misfortune to have his house at Dantzig burnt down. By this calamity he is said to have sustained a loss of several thousand pounds; for not only were his observatory and all his valuable instruments and apparatus destroyed, but also a great number of copies of his *Machina Cœlestis;* an accident which has rendered the second part very scarce, and consequently very dear. Hevelius died on the 28th of January 1687, his birth-day, at the age of seventy-six. He was a man greatly esteemed by his countrymen, not only on account of his skill and reputation in astronomy, but as an excellent and worthy magistrate. He was appointed a burgomaster of Dantzig; an office which he executed with the utmost integrity and approbation. He was also highly esteemed by foreigners, not only by those who were skilled in astronomy and the sciences, but by foreign princes and potentates; as appears from a collection of their letters to him, which was printed at Dantzig in the year 1683. The printed works of Hevelius are, 1. Selenographia, Dantzig, in folio; 2. Letters to Eichstadt on an Eclipse of the Moon, to Gassendi and to Boulliau on an Eclipse of the Sun, 1649, and to Riccioli on the Libration of the Moon; 3. Letter to Nucerius on Eclipses, 1654; 4. De Nativa Saturni Facie, 1656; 5. Mercurius in Sole visus, 1662; 6. Historia miræ Stellæ in collo Ceti, 1662; 7. Prodromus Cometicus, Descriptio Cometæ, Mantissa Prodromi Cometici, 1665 and 1666, in folio; 8. Cometographia, 1668, in folio; 9. Machina Cœlestis, pars prior, 1673; 10. Epistola de Cometa anni 1672, Id. anni 1677, in 4to; 11. Machina Cœlestis, pars posterior, 1679; 12. Annus Climactericus sive Observationum quadragesimus nonus, 1685. The posthumous works of Hevelius are, 1. Prodromus Astronomiæ, 1690; 2. Uranographia seu Firmamentum Sobescianum, 1690; together with Excerpta ex Litteris illustrium et clariss. Virorum ad Jo. Hevelium perscriptis, judicia de rebus astronomicis ejusdemque scriptis exhibentia, Dantzig, 1684, in 4to.

HEWSON, WILLIAM, a very ingenious anatomist, was born in 1739. He became assistant to Dr Hunter, and afterwards entered into partnership with him; but on their disagreement, he read anatomical lectures at his own house, in which he was seconded by Mr Falconer. He wrote Inquiries into the Properties of the Blood, and the Lymphatic System, 2 vols.; and disputed with Dr Monro the discovery of the lymphatic system of vessels in oviparous animals. Hewson died in 1774.

HEXACHORD, in ancient music, a concord called by the moderns a sixth.

HEXAGON, in *Geometry*, a figure of six sides and angles; and if these sides and angles be respectively equal, it is called a regular hexagon.

HEXAHEDRON, in *Geometry*, one of the five platonic bodies, or regular solids, being the same with a cube.

HEXAMETER, in ancient poetry, a kind of verse consisting of six feet, the first four of which may be indifferently either spondees or dactyles; while the fifth is generally a dactyle, and the sixth always a spondee.

HEXAPLA (formed from ἑξ, *six*, and ἁπλοω, *I open, I unfold*), in *Ecclesiastical History*, a bible disposed in six columns, containing the text, and different versions thereof, compiled and published by Origen, with a view to secure the sacred text from future corruptions, and to correct those which had been already introduced.

Eusebius relates that Origen, after his return from Rome under Caracalla, applied himself to learn Hebrew, and began to collect the several versions which had been made of the Sacred Writings, and from these to compose his Tetrapla and Hexapla; others, however, are of opinion that he did not begin till the time of Alexander, after he had retired into Palestine, about the year 231.

To understand what this Hexapla was, it must be observed that, besides the translation of the Sacred Writings, called the Septuagint, made under Ptolemy Philadelphus, about 280 years before Christ, the Scriptures were translated into Greek by other interpreters. The first of these versions, or, reckoning the Septuagint, the second, was that of Aquila, a proselyte Jew, the first edition of which he published in the twelfth year of the emperor Hadrian, or about the year of Christ 128; the third was that of Symmachus, published under Marcus Aurelius, or, at least, under Septimius Severus, about the year 200; the fourth was that of Theodotion, prior to the version of Symmachus, which appeared under Commodus, or about the year 175. These Greek versions, says Dr Kennicott, were made by the Jews from their corrupted copies of the Hebrew, and were designed to stand in stead of that by the Seventy, against which they were prejudiced, because it seemed to favour the Christians. The fifth was found at Jericho, in the reign of Caracalla, about the year 217; the sixth was discovered at Nicopolis, in the reign of Alexander Severus; and Origen himself recovered part of a seventh, containing only the Psalms.

Now Origen, who had held frequent disputations with the Jews, both in Egypt and in Palestine, having observed that they always objected against those passages of Scripture quoted against them, and appealed to the Hebrew text; in order the better to vindicate those passages, and to confound the Jews by showing that the Seventy had given the sense of the Hebrew, or rather to show by a number of different versions what the real sense of the Hebrew was, he undertook to reduce all these several versions into a body along with the Hebrew text, so that they might easily be confronted, and thus afford a mutual illustration.

He made the Hebrew text his standard; and allowing that corruptions might have taken place, and that the old Hebrew copies might and did read differently, he contented himself with marking such words or sentences as were not in the Hebrew text, nor in the later Greek versions, and adding such words or sentences as were omitted in the Seventy, prefixing an asterisk to the additions, and an obelisk to the others.

With this view he made choice of eight columns, in the first of which he gave the Hebrew text in Hebrew characters; in the second the same text in Greek characters; whilst the rest were filled with the several versions above mentioned, all the columns answering verse for verse, and phrase for phrase; and in the Psalms there was a ninth column for the seventh version.

This work of Origen was called 'Εξαπλα, *Hexapla*, or work of six columns, as regarding only the first six Greek versions. But Epiphanius, taking into account the two columns of the text, calls the work *Octapla*.

This celebrated work, which, Montfaucon imagines, consisted of fifty large volumes, perished long ago, probably with the library at Cæsarea, where it was preserved in the year 653; though several of the ancient writers have preserved fragments of it, particularly St Chrysostom on the Psalms, and Philoponus in his Hexameron. Some modern writers have earnestly endeavoured to collect fragments of the Hexapla, particularly Flaminius Nobilius, Drusius, and Montfaucon.

HEXASTYLE, in *Architecture*, a building with six columns in front.

HEXHAM, a market-town of the county of Northumberland, in the ward of Tindal, 286 miles from London. It stands at the head of a beautiful valley, at the junction of the North with the South Tyne. The church, formerly a cathedral, is ancient and spacious, and the interior highly ornamented; and adjoining to it are some venerable appendages. The streets are narrow, but clean. It is not a place of much trade. The chief occupations are tanning leather, and making shoes and gloves. It has well-attended markets on Tuesday and Saturday. The population amounted in 1801 to 4565, in 1811 to 4846, in 1821 to 5436, and in 1831 to 6042.

HEYDON, John, sometimes called *Eugenius Theodidactus*, was a great pretender to skill in the Rosicrucian philosophy and the celestial signs, in the reign of King Charles I., and wrote a number of chemical and astrological works. This empiric was much consulted by the Duke of Buckingham, who believed in judicial astrology. He employed Heydon to calculate the king's and his own nativity, and was assured that his stars had promised him great things. The duke also employed Heydon in some treasonable and seditious practices, for which he was sent to the Tower. The astrologer lost much of his reputation by telling Richard Cromwell and Thurloe, who went to him disguised like cavaliers, that Oliver would infallibly be hanged by a certain time. This period, however, he outlived several years.

HEYLIN, Dr Peter, an English divine, was born at Burford, Oxfordshire, on the 29th of November 1600. He studied at Oxford, where he took his degrees in arts and divinity, and became a geographer and an historian. He was appointed one of the chaplains in ordinary to King Charles I., was presented to the rectory of Hemingford in Huntingdonshire, made a prebendary of Westminster, and presented with several other livings; but of these he was deprived by the parliament, who also sequestrated his estate, by which means he and his family were reduced to want. On the restoration, however, he recovered his spiritualities; but never rose higher than subdean of Westminster. He died in 1662, and was interred in St Peter's Church in Westminster. His principal writings are, 1. *Microcosmus*, or a Description of the World, 1621; 2. *Cosmographia;* 3. The history of St George of Cappadocia, 1631; 4. *Ecclesia Vindicata*, or the Church of England Justified; 5. Historical and Miscellaneous Pieces.

HEYNE, Christian Gottlob, an illustrious classical scholar and archæologist, was born on the 25th of September 1729, in a suburb of the city of Chemnitz, in Saxony, where his father, having been compelled by some religious persecutions to abandon his native country of Silesia, had settled, supporting his family in great poverty by exercising the trade of a weaver. It was only by the liberality of his godfathers that Heyne was enabled to obtain his primary instruction in the elementary school of Chemnitz, and afterwards to prosecute his classical studies in the gymnasium of that city. In 1745 he entered the University of Leipsic. There he was so scantily supported by those on whose assistance he relied, that he was frequently in want even of the common necessaries of life, and was sometimes indebted for food to the generosity of a maid-servant in the house where he lodged. In this situation, without even the hope of future distinction, he continued to struggle against every difficulty and disappointment in the acquisition of knowledge. For six months he is said to have allowed only two nights in the week to sleep, and was at the same time forced to endure the reproaches which his godfather thought himself entitled to inflict on him for negligence in the prosecution of his studies. His distress had almost amounted to despair, when he procured the situation of preceptor in the family of a French merchant resident in Leipsic. He was thus enabled to continue his studies, though with much interruption; the emoluments of his appointment being sufficient to support him in what was at least comparative comfort. Under Ernesti, he was initiated into the criticism of the classical authors; from the prelections of the celebrated Bach he acquired a competent knowledge of the Roman jurisprudence; and through the instructions of Christius, who lectured on archæology, and with whom he was intimately acquainted, his attention was strongly directed to the works of ancient art. Having finished his studies at the university, he was exposed for many years to all the accumulated distresses of poverty and neglect. The first situation he was able to procure was that of copyist in the library of Count de Bruhl, with a salary of only an hundred dollars, which he obtained in the year 1753. From the necessity of adding something to this scanty pittance, he was forced to employ himself in the drudgery of translation; and, besides some French novels, he translated into German the Greek romance of Chariton. He published his first edition of Tibullus in 1755, and in 1756 his Epictetus. In 1756, his emoluments as copyist were doubled, and the education of Prince Maurice de Bruhl was intrusted to him, but without any additional salary. The invasion of Saxony by the Prussians deprived him of his appointment, and even destroyed the library on which it depended. The period of the seven years' war was that in which he was chiefly exposed to the storms of fortune; and his marriage with Theresa Weisse, a young woman of distinguished genius, but equally poor with himself, increased his misery. Having been obliged to retire into Lausatia, he lived for some years as steward in the family of the Baron de Leoben. He was enabled, however, to return to Dresden in 1762, where he was intrusted, by Lippert, with the care of writing the Latin text of the third volume of his *Dactyliotheca*.

At length, in the commencement of the year 1763, his merit met with its reward, and a new and illustrious career was opened to him. On the death of John Matthew Gesner, in 1761, it became necessary for the curators of the university of Göttingen to look around for a successor capable of sustaining the reputation which the institution had acquired by the learning and talents of that distinguished scholar. The appointment was offered to Ernesti, who, whilst he declined leaving the university of Leipsic, proposed Ruhnkenius of Leyden or Saxius of Utrecht for the situation. Ruhnken likewise refused the appointment, but having been strongly impressed by the taste and learning displayed by the editor of Tibullus and Epictetus, he advised Munckhausen, the Hanoverian minister and principal curator of the university of Göttingen, to bestow the professorship on Heyne, whose merit, though known to few, he ventured to promise would do honour to the choice. The minister had the good sense to acquiesce in the recommendation of this great scholar, and Heyne, after some delay, became professor of eloquence in Göttingen. Though his appointments were at first few, and his emoluments inconsiderable, these were gradually augmented in proportion as his usefulness was approved, and as his growing celebrity rendered it an object with the other governments of Germany to secure for their literary institutions the services of so distinguished a scholar. He refused the most advantageous and honourable overtures from Cassel, Berlin, and Dresden. In his different capacities of professor, principal librarian, member of the Royal Society, and chief editor of the Literary Gazette, and still more by his publications, he mainly contributed to raise the university of Göttingen to the distinguished rank it holds among the academies of Europe. After a long and useful career, graced with all the distinctions which in Germany are conferred on literary eminence, he died, full of years and honour, on the 14th of July 1814.

In Greek literature he has given us editions of Homer's *Iliad*, Pindar, Diodorus Siculus, Apollodorus, and Epictetus; and, in Latin, editions of Virgil and Tibullus; all illustrated with copious commentaries. His *Opuscula Academica*, in five volumes, contain a series of 116 academical dissertations, of which the most valuable are those respecting the antiquities of Etruscan art and history, and the researches regarding the colonies of Greece. He has left us also a great number of papers on almost every subject of erudition, more especially on ancient mythology, amongst the *Commentationes Societatis Regiæ Gottingensis*. His *Antiquarische Aufsätze*, in two volumes, comprise a valuable collection of essays on different subjects connected with the history of ancient art. In the earlier part of his life he translated, or rather wrote anew, a great part of the *Universal History*.

After this notice of the chief events of his life, and of his literary productions, it may be proper to say somewhat in regard to the distinctive merit which has raised Heyne to so eminent a place amongst the promoters of classical literature. And here it is chiefly as an interpreter of the ancient poets, and as an original investigator of the ancient mythology, that he must rest his claims to the celebrity he has acquired. As a critic of the works of art, his desert is great, but he has no pretentions to original or peculiar discoveries.

The example of the great philologists of Holland, and the more immediate influence of Ernesti and Gesner on the taste and pursuits of their countrymen, had, before the middle of the last century, awakened in Germany a new zeal for the study of the ancient authors, and had advanced the criticism of classical literature to a rapid and vigorous maturity. The great writers of antiquity ought not, however, to be read with a regard limited merely to their language; they more especially deserve a close and enthusiastic study, for the admirable means which they afford of improving the understanding and of cultivating the taste. From the year 1760, about which period the Germans had begun to devote themselves, with an enthusiasm as zealous as it was tardy, to the cultivation of their native language and literature, several intelligent philologers displayed a more refined and philosophical method in their treatment of the different branches of classical learning, and, without neglecting either the grammatical investigation of the language, or the critical constitution of the text, no longer regarded a Greek or Roman writer as a subject for the mere grammarian and critic, but, considering the study of the ancients as a school for thought, for feeling, and for taste, they initiated us into the great mystery of reading every thing in the same spirit in which it had originally been written. They demonstrated, both by doctrine and example, in what manner it was necessary for us to enter into the thoughts of the writer, to pitch ourselves in unison with his peculiar tone of conception and expression, whether erroneous or correct, and in every instance accurately to investigate the circumstances by which the mind of the poet or philosopher was affected, the motives by which he was animated, and the influences which co-operated in giving the intensity and character to his feelings. It was shown how generally the conception of the reader was merely a veil thrown over the thought of the original. It was no longer allowed to combine modern with ancient ideas, to convert the derivative with the original thought, or to translate it by a new and factitious signification. At the head of this school stands Heyne, both as its founder and principal ornament; and, however some of his disciples may have exposed themselves to ridicule in their application of the principles on which this system of interpretation rests, yet it cannot be denied that nothing has contributed so decisively to maintain and promote the study of classical literature, as the combination which Heyne has effected of philosophy with erudition, both in his commentaries on the ancient authors, and in those works in which he has illustrated various points of antiquity, or discussed the habit of thinking and spirit of the ancient world.

The poverty of Germany in manuscripts has compelled her scholars to rest satisfied in general with the critical apparatus which the philosophers of other nations have collected. What they necessarily wanted in the originality of subsidiary stores, they have, however, endeavoured to supply, by a sound and rational employment of those already compiled; and the praise of useful diligence cannot certainly, with justice, be denied to their labours in this department. Originality, however, was possible in the higher criticism, which does not rest on the collection of readings or the authority of manuscripts, and in the mode of the illustration applied to the ancient writers: in

Heyne.

these respects the later philologers of Germany have earned a glory peculiar to themselves, and which must be remembered as long as learning and ingenuity are respected. How cogently have they reasoned on the authenticity or spuriousness of particular writings, and how skilfully have they applied the test to the interpolations of later times; to what new conclusions are we now brought in regard to Orpheus, Homer, Anacreon, Longinus, &c. by the critical investigations of Schneider, Wolf, Fischer, Hermann, Weiske, and others; how differently has the controversy in regard to the authenticity of certain orations of Cicero been recently concluded by Wolf, compared with the result of Markland's and Gesner's investigations. In this department Heyne does not, however, hold the same pre-eminence which he has attained as an enlightened and popular interpreter; for though his discussions in the higher criticism are both numerous and valuable, he is as much surpassed in boldness and originality by Wolf, as he is inferior to Hermann in the minuteness and ingenuity of his reasoning.

There is, however, another department in which the labours of Heyne are more original, and in which he merits all the honour to which a discoverer is entitled. Until the middle of the eighteenth century, mythology was nothing else than the nomenclature of divinities, a collection of the manifold and discordant legends of their several relations, actions, and destinies, and the delineation of their forms from the works of the poets and artists, illustrated, perhaps, by a mystical and allegorical commentary. About this period some more profound thinkers began to regard the mythical traditions in a higher view, as sources of human history; but, from too confined an acquaintance with the circumstances and condition of the ancient world, they took too high a standard for their explanations, and, through a mystical and allegorical interpretation, thinking they had discovered, under the veil of mythological narration, ideas of the deepest wisdom, they confidently framed thereon hypotheses for the history of mankind, for the arts, for philosophy, and the other sciences, which threatened altogether to extinguish the glimmering light that was still afforded us for the periods of remote antiquity.

Heyne opened a less ambitious but more certain path. Following the observations which travellers had collected in regard to new and uncivilized nations, he applied these to the condition of the Greeks, who, as history informs us, from a rude and sensual barbarism, gradually advanced to a state of civilization and intellectual refinement. He thus arrived at the simple conclusion, that the mythical tales of antiquity contain the first attempts at reasoning, the most ancient history, philosophy, and theology embodied in a poor, unformed, and consequently figurative language; and, therefore, that mythology is a system comprehending partly the original form of representation through objects of sense peculiar to a rude age, expressed in fables, ceremonies, and monuments, transplanted into later times; partly a kind of poetical apparatus derived and formed from this original mythology, and intended only by its authors for the purposes of poetical effect. He hence justly concluded that it is impossible to attain any real insight into the nature of mythical narration, unless the *mythi* of the most ancient poets are carefully distinguished from the abusive applications made of them in the poetry of after times, and unless mythology be kept separate from the philosophy conversant about mythology. In conformity with these fundamental rules, Heyne has illustrated Apollodorus; and in the same spirit he has conducted those researches into the nature and tendency of the different mythi of Greece, which he has published in the *Transactions of the Royal Society of Göttingen.* His views have been almost universally admitted to be correct in principle, and his applications to have been conducted with the most profound learning and almost unequalled ingenuity. A great number of followers have pursued the path he opened; and his theory has now attained the form and stability of a system, through the labours of his disciples. Amongst these, the names of Martin Hermann (not the philologer), of Voss, and of Manso, are especially to be distinguished. The theologians of Germany have likewise applied the same theory to the interpretation of the Sacred Books; and the researches of Eichhorn, Bauer, Ilgen, Hartmann, Vater, De Wette, and a host of other philosophical divines, into the pretended biblical mythi, have been pursued with a learning and acuteness equalled only by the impious audacity of their conclusions. (v. v.)

HEYTESBURY, a borough-town in the hundred of that name, in the county of Wilts, ninety-three miles from London. It stands on the river Whiley, and has on it some mills for the cloth manufacture, which is extensively carried on. It is an ancient burgage tenure borough, and returned two members to the House of Commons, till disfranchised in 1832. The inhabitants amounted in 1801 to 1072, in 1811 to 1023, in 1821 to 1329, and in 1831 to 1412.

HEYWOOD, John, an English dramatic poet, was born at North Mims, near St Albans, in Hertfordshire, and educated at Oxford. But the sprightliness of his disposition not being well adapted to the sedentary and plodding life of an academician, he retired to the place of his nativity, where he had the good fortune to become acquainted with Sir Thomas More. This patron of genius introduced our poet to the Princess Mary, and afterwards to her father Henry, who was much delighted with his wit and skill in music. When Mary came to the crown, Heywood became a favourite at court, and continued often to entertain her majesty, exercising his fancy before her, even till the time when she lay languishing on her deathbed. On the accession of Elizabeth, Heywood, being a zealous Catholic, thought fit to decamp, with other favourites of her deceased majesty, and settled at Mechlin in Flanders, where he died in the year 1565. Heywood was a man of no great learning, nor were his poetical abilities by any means extraordinary; but he possessed talents of more importance in the times in which he lived, namely, the talents of a jester. He wrote several plays, five hundred epigrams, *A Dialogue in Verse concerning English Proverbs*, and *The Spider and Fly, a Parable.* He left two sons, Ellis Heywood, who continued some time at Florence under the patronage of Cardinal Polo, became so good a master of the Italian tongue as to write a treatise in that language, entitled *Il Moro*, and died at Louvain about the year 1572; and Jasper Heywood, who was obliged to resign a fellowship at Oxford on account of his immoralities. The latter translated three tragedies of Seneca, wrote various poems and devices, and died at Naples in 1597.

HIATUS properly signifies an opening, chasm, or gap; but it is particularly applied to those verses where one word ends with a vowel, and the following word begins with one, thereby occasioning a disagreeable opening of the mouth, and harshness of sound. The term *hiatus* is also used in speaking of manuscripts, to denote their defects, or the parts which have been lost or effaced.

HICETAS *of Syracuse*, an ancient philosopher and astronomer, who taught that the sun and stars were motionless, and that the earth revolved round them. This is mentioned by Cicero, and probably afforded Copernicus the first hint of the true system of the world. He flourished 344 B. C.

HICKES, George, an English divine of extraordinary parts and learning, was born at Newsham in Yorkshire on the 20th of June 1642. In 1681 he was made king's chaplain, and two years afterwards dean of Worcester.

But the death of Charles II. stopped his preferment; for though his church principles were very high, he manifested too much zeal against popery to be a favourite with James II. At the Revolution, he, with many others, was deprived for refusing to take the oaths to King William and Queen Mary; and soon afterwards, Archbishop Sancroft and his colleagues considering how to maintain episcopal succession amongst those who adhered to them, Dr Hickes carried over a list of the deprived clergy to King James, and, with his sanction, a private consecration was performed, at which, it is said, Lord Clarendon was present. On this occasion Dr Hickes was consecrated suffragan Bishop of Thetford, and died on the 15th of December 1715. The principal works of Dr Hickes, who was a man of almost universal learning, are the following, viz. 1. Institutiones Grammaticæ Anglo-Saxonicæ et Mœso-Gothicæ; Grammatica Islandica Runolphi Jonæ; Catalogus librorum Septentrionalium; accedit Eduardi Bernardi *Etymologicum Britannicum*, Oxon. 1689, in 4to, inscribed to Archbishop Sancroft: 2. Antiquæ Literaturæ Septentrionalis libri duo; quorum primus G. Hickesii, S. T. P. Linguarum veterum Septentrionalium Thesaurum Grammatico-Criticum et Archæologicum, ejusdem de antiquæ Literaturæ Septentrionalis utilitate dissertationem Epistolarum, et Andreæ Fountaine equitis aurati Numismata Saxonica et Dano-Saxonica, complectitur; alter continet Humfredi Wanleii librorum veterum Septentrionalium, qui in Angliæ bibliothecis extant, catalogum historico-criticum, necnon multorum veterum codicum Septentrionalium alibi extantium notitiam, cum totius operis sex Indicibus, Oxon. 1705, in three vols. folio: 3. Sermons, 1713, in 8vo: 4. Letter from beyond Seas to the Ministers of the Nonconforming Party, 1674, reprinted in 1684: 5. Ravaillac Redivivus, being a narrative of the trial of James Mitchell, for an attempt on the person of Sharpe, Archbishop of St Andrews: 6. The Spirit of Popery, 1679: 7. Jovian, or an Answer to Julian the Apostate, 1683, in 8vo: 8. Infant Baptism, 1685, in 4to: 9. *Speculum beatæ Virginis*, a discourse of the due praise and honour of the Virgin, 1686: with many other tracts and pieces of a miscellaneous character.

HIDAGE (*Hidagium*) was an extraordinary tax payable to the kings of England for every hide of land. This tax was levied not only in money, but in provision, armour, and other articles; and when the Danes landed in Sandwich in 994, King Ethelred taxed all his lands by hides, so that every three hundred and ten hides found one ship furnished, and every eight hides furnished one jack and one saddle, to arm for the defence of the kingdom. Sometimes the word *hidage* was used to signify being quit of that tax, which was also called *hidegild*, and interpreted, from the Saxon, a price or ransom paid to save one's skin or hide from beating.

HIDALGO, in modern history, a title given in Spain to all who are of a noble family. See Spain.

HIDES, in a general sense, are the skins of beasts; but the term more particularly denotes those of large cattle, such as bullocks, horses, buffaloes, and the like. Hides are called raw when in the state in which they were taken from the carcass; and green when dressed with some of the neutral salts, such as alum, to prevent them from putrefying. When, by a process called tanning, they are impregnated with a vegetable principle, such as that in oak bark, they are said to be cured or tanned. The reputation of South American hides stands very high, and immense quantities of them are annually imported into this country. Great numbers of hides are also yearly brought to Great Britain from the United States, from the Continent, and from various parts of Africa. In 1832 there was imported into this country 186,982 cwt. 3 qrs. 3 lbs. weight of hides, of which quantity South America alone yielded 89,320 cwt. The duty levied upon the whole was L.25,412. 15s. 11d.

HIDJELLEE, a town and district of Hindustan, in the province of Bengal, situated upon the west bank of the Hooghly river. It is the first town which is seen after entering the river. Here ships formerly used to anchor, but they now run up to Kedjeree or Diamond Harbour. There is here an extensive salt manufactory belonging to government. This place is very unhealthy. It was to Hidjellee that the English retreated in 1687, after escaping from the Hooghly. They fortified the island, and held possession of it for three months, against all the efforts of Aurungzebe, till peace was concluded. The vicinity abounds with tigers, and the creeks with sharks and alligators. Long. 88. 10. E. Lat. 21. 50. N. The district is bounded on the east by the Hooghly, and on the south by the sea. Some of the land is good, and produces a great quantity of rice, cocoa-nuts, the betel nut, and other things. It is principally valuable on account of the lands which are overflowed by the spring tides, and on which salt is made. Its chief towns are Hidjellee and Contai.

HIERACITES, in *Ecclesiastical History*, Christian heretics in the third century, so called from their leader Hierax, a philosopher of Egypt, who taught that Melchizedek was the Holy Ghost, denied the resurrection, and condemned marriage.

HIERAPOLIS, in *Ancient Geography*, a town of Phrygia, abounding in hot springs, and so called from the number of its temples. There are coins extant exhibiting figures of various gods who had temples here. Of this place Epictetus the Stoic philosopher was a native. It is now called *Pambouk;* and is situated near the Scamander, on a portion of Mount Mesogis, distant six miles from Laodicea.

HIERARCHY, amongst divines, denotes the subordination of angels. Some of the Rabbin reckon four, others ten, orders or ranks of angels, and give them different names, according to their different degrees of power and knowledge.

Hierarchy likewise denotes the subordination of the clergy, ecclesiastical polity, or the constitution and government of the Christian church considered as a society.

HIERO I. and II. kings of Syracuse. See Syracuse.

HIEROCLES, a violent promoter of the persecution of the Christians under Diocletian, flourished in the year 302. He wrote against the Christian religion some books, in which he pretends to expose inconsistencies in the Holy Scriptures, and compares the miracles of Apollonius Tyanæus with those of Jesus Christ. He was refuted by Lactantius and Eusebius. The remains of his works were collected into one volume octavo by Bishop Pearson, and published in 1654, with a learned dissertation prefixed to the work.

Hierocles, a Platonic philosopher of the fifth century, who taught at Alexandria, and was admired for his eloquence. He wrote seven books upon Providence and Fate, and dedicated them to Olympiodorus, who by his embassies did the Romans good service under the emperors Honorius and Theodosius the younger. But these books are now lost, and we only know them by the extracts in Photius. He wrote also a Commentary, which is still extant, upon the golden verses of Pythagoras.

HIEROGLYPHICS.

Definition.

THE term HIEROGLYPHICS (Ἱεϱογλυφικα, from ἱεϱος, *sacred*, and γλυφω, *to carve* or *engrave*) literally denotes *sacred sculptures*, or characters, and appears to have been applied by the Greeks to that particular species of writing which they found inscribed or engraven on the palaces, temples, sepulchres, and other public monuments of Egypt.

The epithet *sacred* (ἱεϱος), which enters into the composition of this term, is, however, apt to mislead those who have not attended particularly to the subject. The *hieroglyphics* were not so denominated as being *exclusively* appropriated or confined to compositions connected with religion; they, in fact, constituted a real written language, applicable to history and common life, as well as to subjects of a religious or mythological kind. This opinion, which the sagacity of Warburton enabled him to form, long before the true nature of these characters had been divined, is established as incontrovertible by the Greek inscription on the stone of Rosetta, which speaks of the three divisions or compartments of the pillar as containing different versions of the same decree, one in the sacred characters, another in the enchorial or vulgar, and a third in Greek, being a translation of the other two; and that there is no fraud or deception in this description, is at once made evident by the coincidence of the numerals at the end of the hieroglyphical text with the concluding words of the Greek inscription.[1] Instead, therefore, of qualifying these characters or sculptures as *sacred*, the Greeks, had they been aware of their real nature, or of *all* purposes to which they were applied, would have described them as *monumental*, and thus distinguished them from the other forms of writing in use amongst the Egyptians, by the circumstance which appears to have almost invariably regulated their application. They constituted the monumental writing of ancient Egypt; and as such were distinguished from the intermediate form, called the *hieratic*, which is for the most part confined to the papyri, and still more from the *enchorial* or *demotic*, which appears to have been employed for the ordinary purposes of life. In common language, where nice distinctions are seldom necessary, the term *hieroglyphics* is indifferently applied to all the three forms of writing, monumental, hieratic, and enchorial; but, in a treatise like this, where the object is to convey accurate information, we must be careful to avoid such confusion, and at the same time to impress upon the mind of the reader the necessity of keeping constantly in view the distinctions here traced, which will afterwards be more fully unfolded and explained.

I. HISTORICAL AND CRITICAL VIEW OF THE OPINIONS ENTERTAINED RESPECTING HIEROGLYPHICS, AND OF THE ATTEMPTS MADE, AT DIFFERENT TIMES, TO DECIPHER THEM.

Hist

All antiquity is agreed in representing the country of the Pharaohs as the birthplace of science, learning, and art, and as the theatre of the earliest form of civilization of which any monument or even tradition has been preserved. At a period when the soil of Greece and of Italy was covered with primeval forests, affording shelter only to wild beasts, or to roving barbarians hardly less savage, the valley of the Nile was occupied by a people far advanced in civil and social improvement, and who had already constructed those Titanian monuments which still command our wonder and admiration, after the lapse of more than three thousand years, and the ravages of successive conquests. Nor has this people been indebted for their high celebrity either to the barbaric splendour of military achievements, or to any of the ordinary elements which constitute material grandeur. On the contrary, the circumstances which have mainly contributed to ensure them an incontestible superiority over most other nations of the world are, the antiquity of their civilization, the wisdom of their institutions and laws, the extent and variety of their knowledge, the singular character of their government and religion, and the everlasting monuments on which they have engraved their history, and inscribed the names and titles of their gods and their kings. Long before any other country had emerged out of barbarism; when even antiquity, in the ordinary estimate, had not begun; Egypt enjoyed the benefit of a regular government, and cultivated with equal ardour and success those sciences and arts which the Greeks afterwards borrowed, but did not in every instance improve.[2]

As early as the days of Moses, who was himself instructed in the wisdom of the Egyptians,[3] that people, amongst whom laws, institutions, learning, and the arts had already attained an extraordinary development, appear to have reached the maximum of improvement; they had, in fact, completed their ascending movement, and were fixed on that elevated position which nations generally occupy, for a longer or shorter period, before they begin to descend, and in which the genius of their civil, religious, and social system was eminently calculated to maintain them, for ages, stationary. All the notices incidentally given by the sacred historian, corroborated by the evidence of contemporary monuments, clearly indicate a people who had already arrived at this grand limit, and who were in the full possession and enjoyment of all the advantages derivable from the peculiar forms of religion and government under which they lived. Even in that remote age, the civilization of the Egyptians had passed into a proverb; nor is it by any means improbable that the Jewish legislator, in framing a code of laws for the people whom he was directed by his high mission to deliver from bondage, and form into a nation, transfused into it somewhat of the practical or written wisdom which he had learned in the country of his birth and education.

---

[1] This was first remarked by Mr Akerblad, who pointed out, at the close of the hieroglyphical inscription, the three first numerals, indicated by I. II. and III. where the Greek has "the first and the second," Και στησαι ἐν ἑκαστωι των τι πϱωτων και δευτεϱω[ν θεων ἱεϱωι], the end being broken off.

[2] Etienne Quatremère, *Recherches sur la Langue et la Littérature de l'Egypte*, p. 2. Paris, 1808, in 8vo.

[3] "Erat autem Moses eruditus in omni sapientia Ægyptiorum." But Philo, in his life of the Jewish lawgiver, enters into details respecting the education of Moses. "Cum enim felicitate ingenii magistrorum, ex universa Ægypto convocatorum doctrinam excederet, et simul multa ingeniose excogitaret; numeros quidem, et geometriam, musicam rhythmicam, harmonicam, metricam, sive contemplativam accepit ab Ægyptiis doctoribus; maxime vero *occultam philosophiam descriptam*, ut vocant, *literis hieroglyphicis*, hoc est, notis animalium quæ ipsi venerantur pro numinibus." Justin Martyr, in his *Protrepticon*, denies that Moses studied geometry, but affirms that the Jewish leader was initiated in the mysteries of hieroglyphics. He states, "Mosen, omisso studio omnium mathematicarum, quæ in Ægypto vulgares erant, et viles, adjecisse animum *ad solas hieroglyphicas disciplinas*, quæ tum apud eos *solæ in honore et pretio erant*, et non quibuslibet, sed *præcipuis et probatissimis viris, et in abditis locis secreto traderentur*. Has cum didicisset Moses, nil tamen unquam secundum eas, aut dixit, aut fecit; quod contrarium esset unius veri Dei cultui." In this last particular, however, Clemens Alexandrinus is at variance with Justin; for, in the fifth book of his *Stromata*, he says, "Moysen, *juxta hanc hieroglyphicæ doctrinæ consuetudinem multa sub tropicis, ac mysticis animalium symbolis, vitæ moralis præcepta occulte tradidisse*, solis divinæ legis amatoribus pervia; qualia sunt illa, neque porco, neque aquila, neque accipitre, aut corvo vescendum."

From the era of Moses, by whom Egypt is connected with the earliest traditions, no less than with the first historical monument of the human race, until that of the Persian conquest, when its glory and independence perished together; that is, during a long interval of about ten centuries; a few detached and scanty notices, accidentally preserved and often negligently recorded, comprehend all that can be gleaned from the ancient authors respecting either its internal condition or its external relations. It appears, however, that, both before and after the Persian invasion, the Greeks were in the habit of resorting to Egypt to be initiated in the laws, customs, and institutions, as well as science and learning, of the Egyptians; that, notwithstanding all they have alleged as to the exclusion of strangers or foreigners, access was freely afforded them to that knowledge of which the ministers of religion were the sole depositaries; and that in proportion as the seminal principles of civilization began to take root in the genial soil of Greece, they crowded back to obtain fresh supplies from the great storehouse whence the first portion of the good seed had been derived. Thales, Pythagoras, Plato, and many others, were all instructed in the Egyptian school, where they learned the elements of that science which they afterwards taught to their countrymen;[1] in Miletus, in Samos, in Crotona, and in Athens, the disciples of the hierogrammatists kindled the lamps which had been trimmed and supplied in Egypt; and, what is less known though equally certain, the rudiments of that art, the originals of those beautiful forms, which the fine natural genius of the Greeks, improving on their models, carried to an almost ideal perfection, may even now be discovered in the bas-reliefs which cover the temples, palaces, and tombs scattered along the valley of the Nile. The fanatical fire-worshippers of Iran, led by a ferocious conqueror, had, no doubt, wreaked their utmost fury against the edifices consecrated to the worship of the gods of Egypt. In their blind hatred of idolatry, they ravaged the country which they had overrun, and deluged it in blood; but they were neither able to destroy the monuments on which they had exhausted their iconoclastic rage, nor to extirpate the learning which they could not appreciate. Hence, when the fortunes of a second conquest had placed kings of Greek descent upon the throne of the Pharaohs, Egypt, under their enlightened sway, recovered a portion of its ancient splendour; the treasures of that renowned seat of early civilization were placed within the reach of philosophic investigation; Greece repaid a portion of the debt which she had long before contracted; science and learning were cultivated with ardour and success in the new capital to which the Macedonian conqueror had bequeathed his name; and when, at length, the star of the Ptolemies set to rise no more, and Egypt was degraded into a province of the Roman empire, the masters of the world came in their turn to dispose of all that a third conquest had spared.

To the Greeks, therefore, who had so long been connected with Egypt, and to the Romans, by whom the Greeks were at length replaced, it was natural to look for the most ample information respecting the institutions, manners, customs, arts, antiquities, science, and literature of that interesting region. Nor, in regard to some of these subjects, did the curious look altogether in vain. Herodotus has devoted a considerable portion of his history to details connected with the laws, usages, manners, and topography of Egypt, which he studied on the spot; and much useful information may likewise be collected from the writings of Diodorus Siculus, Strabo, and others, as well as from those of the later Roman authors, in their incidental notices of that country. But there is one subject, perhaps the most interesting of all, respecting which they have supplied little or no intelligible information; we mean the literature of Egypt, including therein the different methods of writing practised in that country from the earliest times.

In Egypt, the arts of sculpture and painting were at all times subordinate to, and in reality branches of, the art of writing; whilst the monuments scattered over its surface were almost all covered externally with sculptures, or internally with paintings, obviously employed as a species of written language, and intended to serve as records of past events, or of laws, usages, customs, and rites, which had existed at the time when these memorials were originally traced. Here was a circumstance apparently calculated to stimulate the most sluggish curiosity, and to excite even indifference itself to inquire and examine. For what subject of greater interest could possibly be presented to the human mind, than the pictured records of the earliest civilization, which, with a view to the perpetuity of their endurance, had been consigned to eternal monuments? But, from whatever cause, whether from that absurd pride which led the Greeks and Romans to disdain studying those forms of speech which they considered as barbarous, or from the total want of philological talent, and an incapacity for pursuing painful and laborious speculations, the classical writers supply us with nothing beyond a few vague and imperfect notices, which it is often equally difficult to understand or to reconcile; and, whilst they tell us not only that Egypt was the parent of all arts and sciences, but that the hieroglyphical inscriptions on its public monuments contained a summary of the most important mysteries of nature and the most sublime inventions of man, they at the same time pretend that the interpretation of these characters had been so studiously concealed by the priests from the knowledge of the vulgar, and had indeed been so imperfectly understood by themselves, that, in the days of the later Roman emperors, it was wholly lost and forgotten. It is even alleged, though the story seems to rest upon no authentic foundation, that a reward was offered in vain, by one of the first Cæsars, for an interpretation of the inscription on an obelisk, then recently brought from Egypt to Rome.[2] Modern ingenuity is not therefore likely to derive much assistance from any thing which has been transmitted to us on this subject by the Greek or the Roman writers. Their ignorance of the hieroglyphic system in its details is either admitted or evident; and even Clement of Alexandria, who certainly understood the different methods of writing practised in Egypt, has expressed himself with so much technical conciseness, not to say obscurity, that, with all the lights of recent discovery to guide us, it is by no means an easy task to interpret his meaning.

---

[1] "Horum itaque admirandum studium," says Kircher, "cum in Græcia percrebuisset, Græcorum sapientissimi ejus gustandi allecti desiderio, Solon videlicet, Thales, Plato, Eudoxus, Pythagoras, et Lycurgus in Ægyptum ad consuetudinem cum sacerdotibus contrahendam sese contulerunt." (*Obelisci Ægyp. Interpret. Hierog.* p. 144. Rome, 1666, in folio.) The learning of the Egyptians was exclusively in the hands of the priests, especially of those who were called *ἱερογραμματεῖς*, or *sacred scribes*, and seems to have been embodied in a great number of volumes, which also contained the annals of the nation, with whatever related to its laws and religion. Diodorus Siculus, describing the palace of Osymandias, makes mention of a library; and Manetho, cited by Jamblicus, states the number of books attributed to Hermes or Thoth, or belonging to that celebrated personage, at thirty-six thousand five hundred and twenty-five. (Zoëga, *De Orig. et Usu Obeliscorum*, p. 502; and Wilkins, *Dissert. de Lingua Coptica*, at the end of the *Oratio Dominica* of Chamberlayne, p. 81.)

[2] Young, *Account of some Recent Discoveries in Hieroglyphical Literature*, p. 2.

In the infancy of art and civilization, mankind appear to have employed mimetic images, or portraits, to represent individual objects, and give notice of events to those at a distance. Thus, the Mexicans denoted the arrival of the Spaniards by a rude delineation of a ship, and of a man distinguished by the peculiarities of the European dress. This is what may be called *picture writing*, or the natural representation of objects or actions. But mere mimetic images, which could convey no idea of time, nor indicate any abstract quality or attribute, were totally insufficient for the purposes of communicating information and recording events. Hence conventional signs, sometimes kuriological and sometimes tropical,[1] were chosen to serve as symbols both of things and thoughts, of objects in nature and ideas of the mind. But much time must have elapsed before men learned to communicate with one another by means of symbolical pictures or representations; and no length of time could possibly render such a method of communication easy. The painter or sculptor, as it might be, would probably begin improvement by lessening the size and abridging the number of his signs; the language spoken to the ear helping him to represent that which was to be addressed to the eye. But, in the formation of language, man invariably proceeds from particulars to generals; classifying individuals according to their species, and arranging qualities or attributes under their proper categories. Thus, in inventing words for expressing his ideas, he would also invent the means of limiting their number; and, as oral preceded written language, the forms and figures of speech would instruct the graphic artist how to express his sentiments and abridge his symbols. The metaphors which he employed in speaking would naturally suggest the images which he might use in writing. If, when he spoke, he called a strong man a lion, when he wrote he might draw the figure of that animal as the symbol of strength or force. But the inconvenience of representing the entire image would be almost immediately felt; and therefore necessity would teach the use of synecdoche, or putting a part for the whole, as when the Mexicans represented the *rabbit* by its *head*, and the *reed* by its *flower*. By another natural transition, or rather advance, an action or event would be indicated by some object necessary to its accomplishment, or the concomitant thereof, as when the Egyptians expressed the existence of a *siege* by painting a *scaling-ladder*.[2] Thus the classifications which take place in all languages, but more especially the tropes and figures which abound in all dialects spoken by nations not yet refined by the highest civilization, must have greatly facilitated both the invention and the comprehension of hieroglyphics.[3] In the progress of improvement, then, we have two stages clearly defined; first, *picture-writing*, which consists in the mere representation of events, or of objects in a state of action with one another; and, secondly, *hieroglyphics*, or symbolical writing, which is sometimes kuriological, and sometimes tropical.

Nor is all this matter of hypothetical speculation. Humboldt, in treating of the graphic system of the Mexicans, which he has commented on with great learning and ingenuity, shows that both the stages above described in some measure co-existed amongst them, and were occasionally combined, though never confounded. They had picture-writing, in its simple and primitive form; and they had likewise a species of hieroglyphical representation, far inferior indeed to that which is found in the Egyptian inscriptions, but still to a certain extent constructed upon the same, or at least similar principles. It appears that the use of hieroglyphical paintings was common amongst the Toltecks, the Aztecks, and other tribes inhabiting the elevated plain of Anahuac, which extends northward from Mexico, and is nearly the same with the territory known by the name of New Spain. But no trace of alphabetical characters was anywhere to be found. The analysis of sounds, which leads to the most admirable, we might say the most miraculous, of all inventions, an alphabet, had not been attained by any native of the American continent; and it is even probable, as Humboldt conjectures, that the progressive perfection of symbolical writing, and the facility with which objects were delineated, prevented the introduction of letters. They have at least done so, for a much longer time, with the Chinese, who have contented themselves with fourscore thousand characters, composed of two hundred and fourteen keys, or radical hieroglyphics. The same learned traveller proceeds to inform us, that the Azteck people had real hieroglyphical characters for water, earth, air, wind, day, night, speech, motion; that they had the same for numbers, and for the days and months of the solar year; that these signs, added to the painting of an event, marked the time and other circumstances of the action; that amongst the Mexicans there were found vestiges of the hieroglyphics called *phonetic*, which indicate not relations with things, but with the spoken language; and that, upon the whole, the Mexican paintings bear a great resemblance, not so much to the hieroglyphical writings of the Egyptians, as to the rolls of papyrus found in the swathings of the mummies, which, according to him, are all paintings of a mixed kind, uniting symbolical characters with the representation of an action.[4] In a word, the Mexicans, at the time when their country was overrun by the Spaniards, appear to have made considerable progress in that method of writing which had attained to so high a degree of perfection amongst the Egyptians; they had passed through the first stage in the career of improvement, and were already entering upon the second, when the hieroglyphic, which is at first employed to modify, comes ultimately to supersede picture-writing.

---

[1] Those hieroglyphics in which part of a material object is put for the whole, are here called *kuriological;* and those in which one thing is put for another, on account of some real or supposed analogy between them, are denominated *tropical.*

[3] Drummond, *Origines, or Remarks on the Origin of several Empires, States, and Cities*, book iv. chap. 9.

[4] Humboldt, *Researches concerning the Institutions and Monuments of the ancient Inhabitants of America*, English translation. "When we examine the history of those nations to which the use of letters is unknown," says this celebrated traveller, "we find, in both hemispheres, that men have attempted to paint the objects which struck their imagination; to represent things that were complex, *by putting a part for the whole;* and thus to compose such pictures as would serve to perpetuate the memory of remarkable events. The Delaware Indian, in scouring the forests, carves some lines on the bark of a tree, to mark the number of the enemy he has killed. Even conventional signs are introduced; and a single stroke marks whether the scalp has been cut from the head of a man or a woman. Such representations, however, are not to be confounded with hieroglyphics, which are essentially different from the mere representation of an event, or of objects in a state of action with one another." He adds, "The first missionaries who visited America compared the Azteck paintings with the hieroglyphical writing of the Egyptians. Kircher, Warburton, and other learned men, have contested the propriety of this comparison, not having been careful to distinguish the paintings of a mixed kind, *in which real hieroglyphics, sometimes kuriological, sometimes tropical, are added to the natural representation of an action.*"

But although hieroglyphics were a great and manifest improvement on mimetic images or picture-writing, still this method of communication was found essentially defective; its symbols were constantly liable to be misunderstood, the art of painting or engraving them could only be practised by a few, and there were some things which could not in this way be expressed at all. Sensible of these inconveniences, and impelled by the natural disposition to abbreviate and simplify, the Egyptians appear, at an early period of their history, to have made some advances towards the introduction of a more compendious and practicable method of expressing their thoughts, by reference partly to the sounds, and partly to the syllabic combinations, of their living speech; in other words, to have entered on that course of improvement which, if pursued, would have ended in the formation of an alphabet. But, notwithstanding all that has been said to the contrary, it is now pretty certain that they stopped short at the threshold, and extended the use of phonetic symbols no further than appeared necessary to remedy the more obvious defects of the hieroglyphic method of writing.

Accordingly, Herodotus, after mentioning that the Egyptians wrote from right to left, contrary to the method in use amongst the Greeks,[1] proceeds to inform us that they employed *two* kinds of characters; the one denominated *sacred*, ἱερα, and the other *popular*, δημοτικα;[2] but he states nothing which could lead us to infer that the sacred and popular characters had any affinity, or that the latter were, through an intermediate form, derived from the former. Diodorus Siculus repeats the statement of Herodotus almost in the same words; adding, however, that the popular characters were taught to all, but that the knowledge of the sacred characters was confined exclusively to the priests.[3] This is undoubtedly concise enough; but it nevertheless embraces all the information which these writers, both of whom had visited Egypt, have thought proper to communicate upon this interesting subject. The statement of Herodotus and Diodorus, however, is in perfect accordance with the inscription on the Rosetta column, in regard to which it is impossible to suspect any error, seeing it bears to have been engraved under the inspection of the priests themselves. That celebrated monument, agreeing in this particular with the authors just named, makes mention of only *two* kinds of characters; the one called *enchorial*, ἐγχωρια γραμματα, or "characters of the country," evidently identical with the *demotic* or *popular* characters of Herodotus and Diodorus; and the other called *sacred*, ἱερα. Thus far, then, the Rosetta inscription and the Greek historians are agreed. But as the latter gives us no information respecting the peculiar nature of the sacred as contrasted with the demotic or enchorial characters, nor conversely, we must turn to the next ancient writer, who treats incidentally of the subject, and endeavour to ascertain whether he has communicated any thing calculated to extend our knowledge, or to supply what is wanting in the statement of his predecessors.

In a well-known passage of the *Stromata* of Clemens Alexandrinus, that learned father enumerates, with great conciseness, but with a degree of precision to which modern discovery has given a high interest, the different kinds of writing in use amongst the Egyptians, and states generally the peculiarities by which these are distinguished. The passage in question, which has been frequently quoted, and often misunderstood or mistranslated, will be found not only to supply the defects in the statement of the Greek historians, but also to receive a singular confirmation from the discoveries of which it is the principal object of this article to give some account.

"Those who are educated amongst the Egyptians," says Clemens, "learn first of all the method of Egyptian writing called EPISTOLOGRAPHIC; secondly, the HIERATIC, which the hierogrammatists (sacred scribes) employ; and, lastly, the most complete method, the HIEROGLYPHIC. The hieroglyphic [is of two kinds]; the one *kuriologic*, (or denoting objects in a direct manner) by means of the primary letters of the alphabet; the other *symbolical*. Of the *symbolical* [there are several sorts]; one represents objects directly by *imitation;* another expresses them *tropically* (that is, indirectly or figuratively); whilst the third employs allegories, expressed by certain ænigmas. Thus, according to the method of representing objects directly or properly by *imitation*, the Egyptians make a circle when they wish to represent the sun, and trace a luniform figure (or crescent) to denote the moon. According to the *tropical* method, they represent objects by means of certain analogies, which they transfer into the expression of those objects by various changes, transpositions, and modifications, very frequently by complete transformations. Thus, when they wish to transmit the praises of their kings under the form of religious legends, they employ *anaglyphs* (that is, transpositions or transformations of the hieroglyphs). Of the third kind of symbolical writing, which is *ænigmatical*, let this serve as an example: The Egyptians assimilate the oblique course of the other [planetary] stars to the bodies of serpents, but the sun they represent by the figure of a scarabœus."[4]

In this passage, it is evident that Clement of Alexandria admits three principal and distinct methods or kinds of the Egyptian writing: first, the EPISTOLOGRAPHIC; secondly, the HIERATIC; and thirdly, the HIEROGLYPHIC.

Of the first and second kinds he gives no detail or explanation whatever. The third, or *hieroglyphic*, which alone occupies his attention, is divided into two sorts: one described as κυριολογικη δια των πρωτων στοιχειων, literally, *kuriologic by means of the first elements;* and the other denominated συμβολικη, *symbolic*.[5] Of the former sort Clemens says nothing; but he enters into details respecting the latter, which he subdivides into three secondary species. The first of these (ἡ κυριολογικη κατα μιμησιν) is indicated with precision, as well by the words themselves, as by the two examples given in illustration: it consists in representing an object properly (κυριολογεισθαι) by imitating (κατα μιμησιν) its form. The second, called the tropical or figurative, is very obscurely defined, and the example is not much clearer than the definition. It is difficult to discover what the author means by the *anaglyphs*, which, he says, the Egyptians employed to hand down the praises of their kings, and which, if they consisted of transpositions merely, might have been formed out of mimetic representations as well as out of tropical symbols.[1] From the classification, however, it appears that, by anaglyphs he understands *sculptured figures* employed as a species of *writing*. As to the third species, namely, the *ænigmatical*, there is no room either for doubt or difficulty.

---

[1] This is the truth, but not the whole truth, as will appear more fully in the sequel.

[2] Διφασιοισι δε γραμμασι χρεωνται (Αἰγυπτιοι), και τα μεν αὐτων ἱερα, τα δε δημοτικα καλεεται. (Lib. ii. c. 36.)

[3] Διττων γαρ Αἰγυπτιοις ὀντων γραμματων, τα μεν δημωδη προσαγορευομενα παντας μανθανειν, τα δ' ἱερα καλουμενα παρα μεν τοις Αἰγυπτιοις μονους γινωσκειν τους ἱερεις. κ. τ. λ. (Lib. iii. c. 3.)

[4] Αυτικα οἱ παρ' Αἰγυπτιοἱς παιδευομενοι πρῶτον μεν παντων την Αἰγυπτιων γραμματων μεθοδον ἐκμανθανουσι, την ΕΠΙΣΤΟΛΟΓΡΑΦΙΚΗΝ καλουμενην· δευτεραν δε, την 'ΙΕΡΑΤΙΚΗΝ, ᾗ χρῶνται οἱ ἱερογραμματεις· ὑστατην δε και τελευταιαν 'ΙΕΡΟΓΛΥΦΙΚΗΝ, ἡς ἡ μεν ἐστι δια των πρωτων στοιχειων κυριολογικη, ἡ δε συμβολικη. Της δε συμβολικης ἡ μεν κυριολογεῖται κατα μιμησιν, ἡ δ' ὡσπερ τροπικως γραφεται, ἡ δε ἀντικρυς ἀλληγορειται κατα τινας αἰνιγμους. 'Ηλιον γοῦν γραψαι βουλομενοι κυκλον ποιουσι, σεληνην δε σχῆμα μηνοειδες, κατα το κυριολογουμενον εἰδος. Τροπικῶς δε κατ' οἰκειοτητα μεταγοντες και μετατιθεντες, τα δ' ἐξαλλαττοντες, τα δε πολλαχως μετασχηματιζοντες χαραττουσιν. Τους γουν των βασιλεων ἐπαινους θεολογουμενοις μυθοις παραδιδοντες, ἀναγραφουσι δια των αναγλυφῶν. Του δε κατα τους αἰνιγμους τριτου εἰδους δειγμα ἐστω τοδε· τα μεν γαρ τῶν αλλων ἀστρων, δια την πορειαν την λοξην ὀφεων σωμασι ἀπεικαζον, τον δε 'Ηλιον τῳ του κανθαρου, κ. τ. λ. (*Stromat.* lib. v. p. 647, Potter.)

[5] In this passage, the words κυριολογικος, κυριολογεῖθαι, are understood of expressions proper to designate objects according to the ordinary usage, and in opposition to figurative terms, or periphrases. Thus Longinus, or the author, whoever he was, of the Treatise on the Sublime, says, ὀυτως ἡ περιφρασις πολλακις συμφθεγγεται τῃ κυριολογιᾳ.

But instead of the *three* kinds of Egyptian writing here described, Herodotus and Diodorus Siculus mention only *two*, namely, the *popular* and the *sacred characters;* a statement which is completely confirmed by the Rosetta inscription, where *two* kinds only are spoken of, viz. the *enchorial*, identical with the *demotic*, and those called *sacred*. These authorities, however, may be satisfactorily reconciled. All the difference between them consists in this, that Clement of Alexandria mentions the *hieratic* writing, in regard to which Herodotus, Diodorus, and the Rosetta inscription are all perfectly silent. But the reason of this is sufficiently evident. The historians and the inscription include the *hieratic* amongst the *sacred characters*, whilst Clement, having employed a more restricted term, found it necessary to distinguish this intermediate form from the *hieroglyphic*, of which, also, he alone makes mention. A few observations will be sufficient to place this matter in the clearest light.

It is agreed upon all hands that the *epistolographic* of Clemens Alexandrinus is identical with the *demotic* of Herodotus and Diodorus, and with the *enchorial* of the Rosetta inscription. But the *hieratic* was certainly a species of the *sacred characters*, inasmuch as it was the form employed by the *hierogrammatists*, or sacred scribes; and hence Clement has denominated it the *sacerdotal writing*, from its having been employed by the priests in manuscripts. The *hieroglyphic*, however, was, properly speaking, the *monumental writing*, as is indeed expressed by the term (ἱερογλυφικα), which literally signifies *sacred characters* SCULPTURED or *engraved;* whilst the *hieratic* might be called the *hieroglyphic writing*, or *sacred characters* WRITTEN. This distinction explains and reconciles every thing. Herodotus and Diodorus do not employ the word ἱερογλυφικα; the epithet they apply is ἱερα, *sacred*, which necessarily includes both kinds of *sacred writing*, the *hieratic* as well as the other. But Clemens Alexandrinus speaks of the *hieroglyphic*, an expression which is less generic, and cannot include the hieratic, a kind of writing which was not employed on the *sculptured* monuments (γεγλυμμενα). The learned father, therefore, differs from the others merely in this; that they have only employed generic expressions, whereas he has entered into the detail of the species. Discrepancy there is absolutely none. For the same reason, in the Rosetta monument, the monumental characters are designated by the epithet ἱερα, instead of ἱερογλυφικα, which might have appeared the term most proper to describe the kind of characters engraved on that stone. But the distinction was unnecessary. For, as the *hieratic* was never employed in monumental inscriptions, and as the question here related to the cutting or engraving of *sacred characters* on the pillar, these characters could be nothing but *hieroglyphics;* and consequently the generic expression ἱερα, *sacred*, was, in this case, altogether as precise as the specific expression ἱερογλυφικα would have been.

Having made these observations with a view to remove ambiguity, and prevent the reader from suspecting the existence of discrepancies, where, in reality, there are none, we shall next exhibit a comparative scheme by means of which the accordance of all the texts, and the different kinds of Egyptian writing mentioned by the ancients, together with their respective relations and dependencies, may be at once perceived and understood.

[1] "Je voudrais," says M. Letronne, "pouvoir définir ce que l'auteur entend par des *anaglyphes*, qui servaient, comme on voit, pour l'expression *tropique* ou *figurée:* dans la rigeur, la première espèce, comme la seconde, devait se composer de *figures* auxquelles convenait également le nom *d'anaglyphes* lorsqu'elles étaient sculptées sur les monumens. Pourquoi donc Clément d'Alexandrie borne-t-il les anaglyphes à l'écriture symbolique figurée? Il faut qu'il entende par-là une espèce particulière de *figures sculptées*, servant toutefois comme *écriture*." (*Examen du texte de Clément d'Alexandrie, relatif aux divers modes d'écriture chez les Egyptiens*, apud Champollion, *Précis du Syst. Hiérogl.* p. 381.) The reader will also find some judicious observations on this subject, by Baron Silvestre de Sacy, in the *Journal des Savans* for March 1825, p. 251, 252.

[2] In regard to the species of hieroglyphic writing described by Clemens as κυριολογικη δια των πρωτων στοιχειων, two questions have arisen, viz. first, In what sense is the word στοιχειων to be understood? and, secondly, What kind of modification does that word receive by being joined with the adjective πρωτων? Upon the fullest consideration, we have followed Letronne in translating πρωτα στοιχεια the *first* or *primary alphabetical letters*. But to this translation there have been started a variety of objections, which we shall now proceed shortly to consider. The principal of these is, that στοιχεια signifies *elements*, not *alphabetical letters* or characters, the name of which in Greek, we are told, is γραμματα. (See Goulianoff, *Questions Archéographiques*, p. 8; *Edinburgh Review*, vol. xlv. p. 103.) Now, we know very well that στοιχεια signifies *elements*, and also that γραμματα is the proper term for *alphabetical letters;* but this does not prevent στοιχεια, employed absolutely, as in the expression above quoted, and used in reference to *writing*, from having the same proper and technical sense. The word στοιχειον, in its radical sense, means a *constituent element* of things, and is consequently susceptible of very different meanings, according to the words with which it is combined, or, when it is employed absolutely, according to the nature of the subject under consideration. This word, which Plato first uses in the philosophical sense of *natural element*, as earth, air, fire, and water, is found in the Politeia, the Sophist, and in twenty places of the Theætetes, in its generic acceptation of *constituent element* of any thing, and, applied to language, *constituent element* of words, that is, *alphabetical letters*, in as far as they represent the *elementary sounds* of each syllable. In fact, στοιχειον is continually opposed by him to συλλαβη. Thus, ὡς μεν ΣΤΟΙΧΕΙΑ ἀγνωστα, το δε των ΣΥΛΛΑΒΩΝ γενος γνωστον,—and ἀρ᾽ αἱ μεν συλλαβαι λογον ἐχουσι, τα δε στοιχεια ἀλογα,—and φερε δη, την συλλαβην ποτερον λεγομεν τα ἀμφοτερα στοιχεια,—

Accustomed to a method of writing in which signs were employed as the representatives of *sounds* only, the Greek and Roman authors, who had either directly or indirectly acquired any notion or idea of the graphic system of the Egyptians, and particularly of their monumental writing, seem to have been chiefly struck with the *figurative* and *symbolic* or *ideographic* characters which are so largely intermixed therein; and these, as being the most remote from the nature of those signs with which alone they were conversant, appear to have almost exclusively engaged their attention. Hence they nowhere expressly mention any other class or description of signs; they nowhere explicitly and distinctly intimate, what they could scarcely have been altogether ignorant of, that the Egyptians, along with the ideographic symbols, employed certain images and characters as the representatives of simple or elementary sounds. Even Clemens Alexandrinus, in the passage above quoted and analysed, describes the phonetic hieroglyphics in the most concise manner possible; so concise, indeed, that his statement ("kuriologic, by means of the primary elements" of words), from being unaccompanied with any development or explanation, remained perfectly unintelligible, until the ingenious investigations of Young, Champollion, Letronne, and others, suggested the true interpretation. To this circumstance, then, may perhaps be ascribed the ineffectual efforts of the moderns to resolve or elucidate the hieroglyphical inscriptions. Finding in the classical authors indications only of picture-writing and of symbols employed tropically or figuratively, and never once suspecting the existence of characters of a different kind, the learned men of the sixteenth, seventeenth, and eighteenth centuries invariably proceeded upon the supposition that the hieroglyphic writing was wholly ideographic, or, in other words, composed of characters every one of which was either the natural or arbitrary representative of a distinct idea.

On this assumed principle, indeed, they were all agreed; and, to say the truth, it seemed to receive confirmation from the fact that the hieroglyphical symbols whose forms and values had been indicated by Diodorus Siculus, Horus Apollo, Plutarch, Clemens Alexandrinus, Eusebius, and others, were all of them without exception ideographic. The number of these symbols, compared with the immense variety of characters observable on the monuments, was no doubt exceedingly small; nor, from the known characters, was it possible to deduce any general

---

and προσγινωσκειν τα στοιχεια ἁπασα ἀναγκη τῳ μελλοντι ποτε γνωσεσθαι συλλαβην, κ. τ. λ. In these, and in other passages of the same kind, στοιχεια designates the *sounds* of the *letters* which form each *syllable*; and hence Plato, in another place, speaks of τα των γραμματων στοιχεια τε και συλλαβαι. In the mind of this author, στοιχειον is applied not only to the *articulation*, but to the *figure* or character (γραμμα) which represents it; the one is the element of *spoken* language, the other is the element of *written* language. Aristotle uses this word in the same manner when, speaking of the different parts of speech, he opposes στοιχειον to συλλαβη, the one being a *simple* and the other a *compound* sound. The word στοιχειον, then, without losing any thing of its general signification of *constituent element*, became, when modified according to the subject to which it was applied, the absolute expression, first, of the *four elements*, and, secondly, of the *letters of the alphabet*, which are the *elements* of language (της λεξεως τα στοιχεια ἐστι τα εἰκοσιτεσσαρα γραμματα, as Diogenes Laertius observes). But the only grammatical distinction between στοιχειον and γραμμα consists in this, that στοιχειον designated the *letter spoken*, and γραμμα the *letter written*; the one was applied to the *articulation* itself, and the other to the *visible sign* or character by which it was represented. The Greek grammarians are unanimous on this point; and the distinction is also very well stated by Dionysius of Halicarnassus, in his treatise *De Compositione Verborum*: Ἀρχαι μεν οὖν εἰσι της ἀνθρωπινης και ἐναρθρου φωνης, αἱ μηκετι δεχομεναι διαιρεσιν, ἁς καλοῦμεν ΣΤΟΙΧΕΙΑ και ΓΡΑΜΜΑΤΑ. Γραμματα μεν ὁτι γραμμαῖς τισι σημαινεται· στοιχεια δε ὁτι πᾶσα φωνη την γενεσιν ἐκ τουτων λαμβανει πρωτην, και την διαλυσιν εἰς ταυτα (στοιχεια) ποιεῖται τελευταιαν. The Latin grammarians have made the same distinction between *elementum* and *litera*, which correspond exactly to στοιχειον and γραμμα. Thus Suetonius calls the letter D *quarta elementorum litera*; and Ausonius speaks of *elementorum prima signa*, where *signa* is put for *literæ*. But in Greek, as in Latin, usage in a great measure effaced these distinctions, and the two words were indifferently employed, the one for the other, as perfectly synonymous, each signifying properly and technically *letters of the alphabet*.

This point being established, then, it remains to be seen what effect the word πρωτων placed before στοιχειων can add to the idea. And, at first, considering the principles which Champollion had unfolded in his *Lettre à M. Dacier*, we were led to conclude that πρωτα στοιχεια meant the first or *initial letters of words*; a conclusion which we stated, along with the grounds upon which it had been adopted, in the article *Hieroglyphics* which appeared in the *Edinburgh Review* (vol. xlv. p. 96, *et seqq.*). But further examination, and more particularly the light which M. Letronne has thrown on the subject in the second edition of Champollion's *Précis du Système Hiéroglyphique* (p. 376, *et seqq.*), have induced us to abandon this idea as inadmissible, and to adopt a different interpretation. If, in fact, the meaning of Clemens Alexandrinus had been what we then conceived it to be, he would not have said δια των πρωτων στοιχειων, but δια των ἑκαστου ὀνοματος, or ἑκαστης λεξεως πρωτων στοιχειων. "A moins de supposer que l'auteur n'avait aucun sentiment de sa propre langue, ni l'ombre de sens commun," says M. Letronne, "il est impossible de donner une signification aussi determinée à l'expression στοιχεια, qui, dans un sujet pareil, prise ainsi absolument, signifie en général les *lettres de l'alphabet*, ou ne signifie rien de tout." This, we confess, appears to us to be quite decisive. The interpretation of first or *initial elements of words*, proposed in the *Edinburgh Review*, and the more general one of *initial elements*, suggested by M. de Goulianoff, and afterwards made the foundation of the acrostic system of writing which M. de Klaproth calls *Acrological Hieroglyphics*, were equally adopted, without perceiving, that if the term *element* be not taken in a clear and determinate sense, or, in other words, be not construed with reference to a specific subject, such an expression as that employed by Clemens can have no meaning whatever. He who translates the words *initial elements*, must be prepared to show *what* initial elements are meant; and if he do not, or cannot, his version must go for nothing. It is impossible to draw any conclusion from a vague generality, which, like an identical proposition, fills the ear and cheats the understanding. And, on the other hand, it is absurd, in interpreting such terms, to attach to them a limitation which, besides being gratuitous and unwarranted, is calculated to annihilate their character as general expressions. We conclude, therefore, first, that the interpretation of the *initial letters* of words is inadmissible; and, secondly, that the word πρωτα, conformably to its proper signification, indicates a species of letters, or *primitive sounds*, considered in relation to others that are *secondary* or derivative. And here we observe, that this can only be understood in two ways: 1*st*, As a Greek addressing Greeks, Clement might employ an idea which was familiar to them, that of the formation of their own alphabet, which, according to the general tradition of Greece, was at first composed only of the characters or signs of *sixteen sounds*: Or, 2*dly*, The word πρωτα may be conceived as relating, not to the primitive or Phœnician alphabet, said to have been imported into Greece by Cadmus, but to *primitive sounds* in general; that is, to the most simple and elementary of all. In regard to the former hypothesis, it may be said that it accords with the nature of the Cadmean letters, which are more simple and elementary than the eight others subsequently added, and which, consequently, may be considered either as the *first* in the order of time, or the *primary* and *elementary*, with reference to the *secondary* and composite characters. But the latter is, upon the whole, that to which we incline. It is scarcely probable that Clemens Alexandrinus would attempt to explain the phonetic system of the Egyptians by an example or illustration drawn from the obscure traditionary history of the Greek alphabet; whilst, on the other hand, it cannot be doubted that, amongst all nations who have possessed *signs of sounds*, the number of these signs was at first limited to the *principal sounds*, and that others were successively added, in proportion as men found it necessary to decompose these primary sounds, and to have certain *shades* of them represented by distinct characters. Lastly, the passage which has occupied so much of our attention, is not the only one where express mention is made of an Egyptian alphabet. "Hermias informs us," says Plutarch, "that Hermes was the inventor of letters in Egypt. Thus, *to represent the first letter* [of their alphabet], *the Egyptians figured an ibis*, a bird which belongs to Hermes." It is impossible to express more clearly the nature of a *phonetic hieroglyph*, namely, a *sound* represented by the image of an object.

principle by the assistance of which the unknown could be ascertained or interpreted. But fanciful ingenuity soon supplied all defects; and the learned, rather than confess their ignorance, drew largely on their imaginations. Setting out with the preconceived notion that each hieroglyph stood as the representative of a distinct idea, they thought only of discovering or imagining the esoteric meaning which it was supposed to involve. It was never for a moment doubted that the most profound mysteries of nature and of art lay hidden in these monumental sculptures. The simplest characters, employed perhaps to represent phonetically a proper name, were conceived to be types or symbols of ideas too lofty for ordinary comprehension, and worthy of the eternal records to which their preservation had been consigned. Thus, imagination usurping the place of reason, and the wildest conjectures being substituted for facts, the learned who had undertaken to interpret the Egyptian monuments soon became entangled in an inextricable labyrinth of incongruous fancies, and, like the spirits of Milton when puzzled by their metaphysical speculations, "found no end in wandering mazes lost." The farther they advanced the thicker became the darkness, and the more inextricable the perplexity.

Such appears generally to have been the method, if method indeed it may be called, pursued by Pierius, and more especially by Kircher, who imitated and improved on the example of conjectural interpretation given by his predecessor. "The extensive learning of Pierius," says Mr Roscoe, "is chiefly discoverable in his great work on Hieroglyphics, in which he has undertaken to illustrate, from Egyptian, Greek, and Roman symbols, almost every branch of science and of art." The work thus described is entitled *Hieroglyphica, sive de Sacris Ægyptiorum Literis Commentarii*, Basiliæ, 1556, in folio; and, in the fifty-eight *Commentaries* of which it consists, there is certainly displayed a great deal of learning and ingenuity; but, unfortunately, the one is wholly misapplied, and the other is of that anomalous description which constantly resolves either into absurdity or extravagance. An idea of this singular production, from which Kircher appears to have derived his peculiar inspiration, may be formed from the summary contained in a brief address to the reader. "Habes in hisce Commentariis non solum variarum historiarum, numismatum, veterumque inscriptionum explicationem, verumetiam præter Ægyptiaca et alia pleraque mystica, tum locorum communium ingentem magna cum oblectatione sylvam, tum sacrarum literarum, in quibus haud et Christum ipsum, et Apostolos Prophetasque hujusmodi locutionibus usos fuisse videmus exquisitam interpretationem; ut sane vero non temere Pythagoram, Platonem, aliosque summos vivos ad Ægyptios doctrinæ gratia profectos intelligas; *quippe cum hieroglyphice loqui nihil aliud sit, quam divinarum humanarumque rerum naturam aperire.*"

Such is the account given of the *perjucundum beneficium per Pierium oblatum;* nor can it be denied that his oblation is devoid of entertainment, however small may be the addition which it is calculated to make to our knowledge of things human and divine. The author not unfrequently invents the symbol as well as the explanation, and of course finds but little difficulty in making the one correspond with the other. He also takes metaphorical language *ad pedem literæ;* translates it into a visible image or symbol, which he describes with infinite minuteness of detail; and then proposes a resolution or explanation, from which he deduces a long series of consequences, some of them ingeniously puerile or elaborately ludicrous. Nor, in his interpretation of symbols actually employed in hieroglyphical legends and inscriptions is he less imaginative or less entertaining. If right in the first instance, as, for example, in regard to the figure of the lion, he generally contrives to be absurd in the second; he introduces combinations which were never before imagined, and stumbles upon explanations which set sense and gravity equally at defiance. He tells us truly that a lion is the natural symbol of strength or force; but nobody could conjecture or divine from this that the representation of a lion devouring an ape means, according to Pierius, a remedy for fever. "Ego sane disciplinas Ægyptiorum in hujusmodi re secutus, compertum esse inquam, leonem febri correptum, vel si ad furorem usque exæstuet, *unius pastione simiæ liberari.* Quapropter Ægyptii sacerdotes si febricitantem hominem, et sibimet auxilia comparantem significare vellent, leonis simiam vescentis hieroglyphicum ponere soliti sunt; *tanta enim indignatione simiam fert leo, ut nullum animal avidius perdere desideret.*" (P. 8.) The Egyptians, according to Clemens Alexandrinus, assimilated the course of the sun to the body of a scarabœus, upon the same principle that they compared the oblique course of the planetary stars to the bodies of serpents. This statement is clear, and distinct, and intelligible; but Pierius takes a different and much more curious view of the matter, "Cur enim quis Ægyptios sacerdotes irrideat," he asks, "quod mundi speciem ipsosque motus per scarabœum significare tradiderint, si pilulas illas in quibus seminium ex sese primum habuerint, ac in vermiculos primum, mox in certam effigiem conformati fuerint, ad mundi ipsius imaginem et rationem fieri compertum est? Scarabœus enim certo anni tempore bubulum excrementum nactus, materiam eam sibi suscipit elaborandam, quod primo statim Pacis suæ versu mordet Aristophanes, *αιρ' αιρε μαζαν ὡς ταχιστα κανθαρῳ.* Quo loco mazam Poëta pro excremento posuit utcunque primum ex ea pilulas conficit, ut jam mundi ipsius formam imitatur, mox eas ab exortu occasum versus posticis impellens pedibus, non intermissa ratione protrudit, ipse interim aversus ortum spectat, *quasi de industria id det operam, ut cœli ipsius exemplar intuendo, imaginem ejus exprimere conetur.*" (P. 60.) This and the preceding example will serve as well as a thousand to give the reader an idea of the "great work on Hieroglyphics" spoken of by Mr Roscoe; a work in which all sorts of animals, and parts of animals, vegetables, implements, utensils, weapons, and other objects, artificial as well as natural, are symbolised, sometimes individually, sometimes in arbitrary or grotesque combinations, and in which, from beginning to end, it is impossible to discover the slightest approach towards a rational and sound method of inquiry.[1]

After an interval of about a century, Pierius was succeeded by Kircher, who, instead of confining himself to the interpretation of detached symbols, boldly attacked the Egyptian monuments themselves; and, by a strange intermixture of cabbalistical science with the extravagant fancies of a refined system of demonism, attempted to expound the inscriptions with which they are covered. His first published work was his *Obeliscus Pamphilius*, which appeared at Rome in the year 1650; but the *magnum opus* in which his whole system is most elaborately detailed, we cannot say *explained*, is the *Œdipus Ægyptiacus*, vel *Theatrum Hieroglyphicum*, Rome, 1654, in four vols. folio; a work of profound research, infinite learning, and unequalled absurdity. In the *Œdipus Ægyptiacus*, Kircher professes to give a new and hitherto unattempted interpretation of the obelisks and other hieroglyphical monuments extant, whether in Egypt, at Rome, or in the more celebrated museums; and we shall immediately submit to the reader a specimen or two illustrative of the mode in which he has accomplished the task undertaken by him. A further exemplification of his system, in all its mystical extravagance, will be found in the *Obelisci Ægyptiaci nuper inter Isaei Romani rudera effossi Interpretatio*, which appeared two years after the publication of the *Œdipus Ægyptiacus*. These six folio volumes contain some tolerably faithful, though inelegant, representations of the principal monuments of Egyptian art, which had been brought to Europe before the time of the indefatigable Jesuit; and, as his system of interpretation succeeded equally well whether he chanced to begin at the beginning, the middle, or the end of an inscription, he has never, in any instance, failed to subjoin an exposition of what he conceived or imagined to be the import of the characters or legends represented.

---

[1] We repeat, however, that the book is amusing, on account of the perverse ingenuity it displays, and the never-failing facility with which the author at once manufactures and expounds his symbols. For instance, a single crane, according to him, means *custodia*, but a plurality of these birds signifies *democratia*, though on what analogy, real or imaginary, we are not informed. From this interpretation, however, he deduces a very sensible etymology: "Sane quidem apud nostros consensus unioque partium in eandem sententiam aut rem, Latino vocabulo formam ab ipsis gruibus videtur accepisse, ut inde CONGRUERE pro *convenire* dicamus." (P. 128.)

According to Kircher, the obelisks, the mummies, and the amulets, all contain mysterious doctrines in religion or metaphysics; and these he proceeds to unfold with as much confidence as if he had been the *mystagogus* of ancient Egypt, and had inherited all the esoteric learning for which the priests of that country were so much celebrated. No difficulty or obscurity ever for a moment impedes the progress of Kircher; his system enables him to penetrate at a glance the most recondite mysteries. Thus, in the oval, cartouche, or ring, on the Pamphilian obelisk, which contains the title AOTKPTP, Αυτοκρατωρ, *Emperor*, expressed in phonetic characters, the learned Jesuit discovers the following luminous oracle: "The author of fecundity, and of all vegetation, is Osiris, whose generative faculty is derived from heaven in his kingdom by the holy Mophta."[1] In like manner, the cartouche or ring of the same obelisk, which contains, in phonetic characters, the words ΚΗΣΡΣ ΤΜΤΙΑΝΣ ΣΒΣΤΣ, Καισαρ Δομιτιανος Σεβαστος, *Cæsar Domitianus Augustus*, signifies, according to Kircher, "Generationis beneficus præses, cœlesti dominio quadripotens, aerem per Mophta beneficum humorem aereum committit Ammoni inferiora potentissimo, qui per simulacrum et cærimonias appropriatas, trahitur ad potentiam exerendam."[2] Out of a proper name, written phonetically, the laborious and imaginative Jesuit elaborates all this untranslateable and unintelligible gibberish. Again, in his *Œdipus Ægyptiacus*, when treating *De Simulacris Ægyptiorum portatilibus*, Kircher translates the serpent, which is a homophone of the letter D, *vitalis*; the three upright lines representing the numeral *three*, *trium elementarium mundorum*; the broken line, which represents N, *humor*; the extended arm, D or T, *beneficus*; the ibis, A, *Mercurium, qui*; the vase and the chain, NH, *in aquam Niloticam, ope catenæ numinum aquaticorum*; the plough, denominated by him *hieralpha*, and a phonetic homophone of M, *Agathodæmon humorem naturæ deducit*; lastly, the sceptre and the bee, the abbreviated Egyptian expression of SOUTEN, *director* or *governor*,[3] signify, according to Kircher, *Ubi polymorphus Dæmon singulis distributa sua portione, inde necessariarum rerum abundantiam confert.*[4] These examples will, we conceive, suffice to show that the learned Jesuit had consulted his imagination alone in devising interpretations so absurd and unintelligible; that all his labour and research were expended in vain; and that, so far from contributing in any degree to elucidate the Egyptian inscriptions, he was eminently successful in thickening the darkness in which they were involved.

But extravagant and nonsensical as all this may appear, and no doubt is, Kircher was nevertheless the founder of a school. The recipient power of human credulity has no limits when vanity or self-love is once conciliated; and, as it is at all times much easier to imagine than to examine, investigate, or analyse, the admirers and disciples of the learned Jesuit failed not, in some instances, to improve upon the absurdities of their master. To men who had no light to guide them, and no footing upon which to take their stand, his mystical jargon appeared a sort of oracular language, which, though nothing could be made of it, was believed to contain every thing. From the operation of the principle, *omne ignotum pro magnifico*, his day-dreams became a sort of transcendentalism in Egyptian archæology; and there were not a few who devoutly believed that Kircher had found out every thing contained, or rather concealed, in the Egyptian inscriptions, if it were only possible to discover his discoveries.[5] But the strange fancies and cabbalistical reveries which excited the stupid wonder of inferior minds, failed to impose upon the strong sense and the powerful intellect of Bishop Warburton. In his justly celebrated work, *The Divine Legation of Moses demonstrated*, that learned prelate discussed, with consummate scholarship, the different ancient texts relating to the methods of writing practised amongst the Egyptians; distinguished theoretically the several sorts of characters employed by them; and deduced, from his inquiries, the important observation, now completely verified, that the *sacred characters*, or hieroglyphics, were not so denominated, as being exclusively appropriated to *sacred subjects*, but that, as stated at the commencement of this treatise, they constituted a real written language, applicable to the purposes of history and common life, as well as to those of religion and mythology. He was no doubt so far mistaken in supposing that each of the three kinds of characters constituted a distinct and independent system of writing. But as he confined himself entirely to such inferences as seemed logically deducible from the ancient authorities examined and discussed by him, without attempting to verify or correct his conclusions by a direct application to the Egyptian monuments, his misconception in this particular was perhaps unavoidable, and ought in no degree to lessen our admiration of that sagacity which led him to divine a truth which had never been suspected by any one before him, and which the subsequent progress of discovery completely demonstrated. If the profound remark of this learned prelate had been duly appreciated, and prosecuted to its consequences, the *quæstio vexata* of Egyptian hieroglyphics would probably have been, in part at least, resolved half a century earlier. But succeeding writers, haunted by the spirit of Kircher, dreamed only of *symbols;* the existence of phonetic signs, or an alphabet, was never suspected by any one except Zoega, who, unconscious of the value of his own ingenious conjecture, abandoned it as soon as produced;[1] it seemed, in fact, to be tacitly agreed that letters were unknown in the country where they are commonly supposed to have been first invented; and though hypotheses were multiplied, the study was not in consequence advanced. Like a temple half buried in the sand drifted from the desert during a long series of ages, Egyptian literature powerfully attracted the attention and excited the interest of those who stopped to gaze on its mystic form and magnificent proportions; but the entrance to the sacred edifice had not yet been discovered and cleared out, consequently the interior remained wholly unknown. The superstition of antiquarianism still hovered round it, and the mystery of ages, in itself an object of strong interest to many, remained inviolate. But the day of the shovel and the spade was nevertheless fast approaching.

---

[1] *Obeliscus Pamphilius*, p. 557.

[2] *Obeliscus Pamphilius*, p. 559. In regard to the Pamphilian obelisk, Kircher has been doubly unfortunate. *It is not genuine.* Of the obelisks still in existence there are perhaps about thirty, larger and smaller, which may be considered as genuine. Several others are decidedly spurious, having been chiefly sculptured at Rome in imitation of the Egyptian style, but so negligently and unskilfully as to exhibit a striking difference even in the character of the workmanship. Such are the Pamphilian, in explanation of which Kircher published the folio volume before us, consisting of near six hundred pages, and also the Barberinian or Veranian obelisk. In both of these the symbols are put together in a manner wholly arbitrary; and when an attempt is made to imitate the appearance of a name, the characters are completely different at each repetition. Another very celebrated monument, the Isiac table, which Kircher also undertook to explain and illustrate, is equally incapable of supporting a minute investigation conducted on solid principles. For the inscriptions neither bear any relation to the figures near which they are placed, nor form any connected sense of their own; and the whole is undoubtedly the work of a Roman sculptor, imitating only the general style and the separate delineations of the Egyptian tablets, as indeed some of the most learned and acute of our antiquaries had already asserted, notwithstanding the contrary opinion of several foreigners of the highest reputation for their intimate acquaintance with the works of Greek and Roman art. (Young on *Hieroglyphical Literature*, pp. 27, 28.)

[4] *Œdipus Ægyptiacus*, tom. iv. Synt. xvii. cap. 2, p. 494.

[5] So late as the year 1821, there issued from the archiepiscopal press of Genoa a new translation of the hieroglyphics of the Pamphilian obelisk, a monument which (as we have already shown) is decidedly *spurious*, but which, according to the Italian Œdipus of symbols, "preserves the remembrance of the triumph over the ungodly, obtained by the worshippers of the thrice Holy Trinity, and of the Eternal Word, under the sway of the sixth and seventh kings of Egypt, in the sixth century after the Deluge;" that is, at a period when neither the "thrice Holy Trinity," nor the "Eternal Word," had as yet been revealed to mankind. From the same incomparable authority we learn, to the utter confusion of our chronology, that one of these pious monarchs was no other than Sesac or Sheshak, who, according to the Old Testament, pillaged Jerusalem, carrying off as lawful spoil the treasures of the temple and of the house of David. Pierius and Kircher, with all their fanciful extravagance, were men of real learning, scholars in the best sense of the term; and though they failed to interpret the hieroglyphics, they were careful not to outrage history and chronology, which, in fact, it was one of their great objects to illustrate and confirm. But this translator of an untranslateable monument seems either to have written his book in a calenture of the brain, or to have published it as an experiment (clumsy enough, in all conscience) upon the credulity of mankind.

Amongst the first contributions to the study of hieroglyphics in this country, may be mentioned two Essays by Mr Alexander Gordon, a draughtsman and antiquary of considerable eminence; the one having for its object to explain the hieroglyphical figures upon the coffin of an ancient mummy belonging to a Captain Lethieullier, and the other, in like manner, to expound the hieroglyphical figures upon an Egyptian mummy in the museum of Dr Mead. These Essays are accompanied with twenty-five copperplates, in which, besides the different views of the soroi or mummy cases, are delineated with tolerable fidelity the *apices* of several obelisks, some Egyptian antiquities in the Ashmolean Museum, groups copied from monuments in other collections, amulets, figures of Isis and Canopus, wooden images of the dead (*παραδειγματα νεκρων ξυλινα*), urns, and other ancient remains; to which is added, a table of the characters found on the Egyptian monuments then in Britain, and amounting to 248 in number. The plates, however, were published before the text with which they are now accompanied; and, in fact, the Essays are only designed to explain three out of the twenty-five, namely, those in which are represented the figures on the mummy-cases. Of the remainder an explanation is also promised, but it does not appear that the author ever fulfilled his intention. Mr Gordon's text is principally descriptive and critical; and he displays equal learning and good sense in his observations on the ancient authorities. But, like his predecessors, he thinks of nothing but symbols, and, in no instance, makes even the slightest approach towards the interpretation of a single character or group which the ancient writers have not explained. The concluding paragraph of the Essay on Lethieullier's mummy will be sufficient to convey to our readers an idea of the whole, as well as to confirm the truth of the observation, that our author was as far from the right course as any of those who had preceded him. "The whole, then, on this mummy," says he, "seem chiefly to be so many *physical symbols*, representing the different powers or properties of their chief deity Osiris or the Sun, as acting in and upon the different parts of nature; and what is on the back of the mummy, a combined figure of both Osiris and Isis, *symbolising universal nature.* And what is curious on this mummy, are the *flagellum* of Osiris, and the *falx messoria* of Isis, exhibited near their mutual figures, being the characteristical marks or rather trophies of their mutual inventions, namely, of the use of grain and agriculture; the one instrument for reaping, the other for threshing the corn; inventions for which, among many others, they were deified; inventions to which the world owes the first bringing of mankind into society; inventions from whence religion, arts, learning, and whatever else is valuable among mankind, owe their origin."[2] The view here referred to is *not* given in the plates; but we can have little doubt that a *lituus* has been mistaken for a *falx messoria*, and a shakal-headed sceptre for a *flagellum.* The idea that the sacred characters might constitute a written language seems never to have entered the mind of this learned and intelligent antiquary.

We come now to consider one of the boldest and most original attempts ever made to penetrate the inscriptions on the Egyptian monuments, and the honour of which is due to M. de Guignes, the celebrated French orientalist. The Abbé Barthélemy having read to the Academy of Belles Lettres a memoir on the Phœnician Letters, M. de Guignes, in examining it, happened to cast his eyes on a dictionary in which the ancient Chinese characters were represented, and observing a striking conformity between these and the letters in question, he at once recollected the opinion expressed by Huet, the celebrated bishop of Avranches, as to the common origin of the Chinese and Egyptians, and resolved to investigate the subject, not as a curious speculation, but with a view to determine the truth. The results of this investigation he communicated to the Academy of Belles Lettres, on the 14th of November 1758, and published the year following under the title of *Mémoire dans lequel on prouve que les Chinois sont une Colonie Egyptienne.* In this memoir, M. de Guignes undertakes, not to explain the monuments of the Egyptians, but to propose some reflections on their system of writing, to examine its progress, to compare it with that of the Chinese, and to show that both nations had originally the same hieroglyphs. With the assistance of the Chinese characters he attempts to penetrate those of the Egyptians, to develope their composition, and to establish their relation to or identity with the Chinese hieroglyphics; he also explains several Egyptian characters; and, lastly, he compares the language and the hieroglyphics of Egypt and of China with the languages and methods of writing which obtained amongst the Hebrews, the Arabians, the Syrians, and other nations of the East. We shall endeavour to state as briefly as possible an outline of the investigation which we have thus generally described.[1]

---

[1] "Sed satis est exemplorum classis ænigmaticæ, superest quinta classes *notarum Phoneticarum.*" (See his great work, *De Origine et Usu Obeliscorum*, p. 454. Rome, 1797, in folio.)

[2] An Essay towards explaining the Hieroglyphical Figures on the Coffin of the Ancient Mummy belonging to Captain William Lethieullier, by Alexander Gordon, A. M. London, 1737, in folio. To which is subjoined, by the same author, An Essay towards explaining the Ancient Hieroglyphical Figures on the Egyptian Mummy in the Museum of Dr Mead, Physician in ordinary to his Majesty, same date.

The hieroglyphical writing of the Egyptians and that of the Chinese are equally composed of different figures representing men, parts of the human body, animals, plants, vases, instruments, celestial bodies, and so on. But the Chinese writing, though composed of the same elements with the Egyptian, is a kind of cursive writing, in which all these figures are represented in the merest outline, without distinguishing the parts which ought to be strongly brought out from those which ought to be less so; that is, all the lines have the same force. In this consists the chief difference between these two kinds of writing; for if the Chinese were finished off like the Egyptian hieroglyphics, their identity, says M. de Guignes, would at once be perceived. He further observes, that the Chinese group and place beside one another several simple characters, which form together a single compound character expressing a word or an idea; and that the same singular proceeding is found to have obtained in the Egyptian writing. From the relations which have only for their object the exterior form of the characters, he then passes to the composition of these characters, that is, to the different parts of which the group is formed; and then proceeds to consider the question, whether those of the Egyptian hieroglyphics of which Horus Apollo has preserved the signification, are composed of the same ideas or the same elements with those of the Chinese. On the result of the examination of this question depends the relation which our author proposes to establish between China and Egypt.

The Chinese possess two hundred and fourteen elementary characters, which the grammarians have called *keys;* and these keys are either employed alone, as characters serving to express an idea, or variously combined one with another, in which case they are only considered as parts of the same character or group. Each of these parts is the representation of an idea which, united to two or three others, produces a word, or another idea resulting from the combination of these simple elements; that is, they form together a species of phrase which is "comme la définition d'une idée plus composée." For example, the Chinese character which expresses *night* is formed of three of these keys,—of one which signifies *obscurity*, of another which signifies the action of *covering*, and of a third which indicates *man;* so that the phrase *obscurity covering men* is the Chinese equivalent of the word *night*, to which it exactly corresponds. In like manner, the character which signifies *music* is composed of three parts or keys, one representing *wood*, another a *thread* or *cord of silk*, and a third *sound;* because the first instruments of music were made of wood, or boards, upon which were extended silken cords. This phrase, therefore, when rendered literally, signifies *sound produced by threads or cords of silk extended on wood.* Hence it may be concluded that these two hundred and fourteen keys are the representatives of as many simple and primitive ideas, which, by means of different combinations, were employed to express new ideas, in proportion as accident or necessity led to their formation. But, according to M. de Guignes, the same observations apply equally to the Egyptian hieroglyphics, in which may be found simple characters corresponding to the keys of the Chinese, and also groups or compound characters. The number of the former is not considerable, being nearly the same as that of the Chinese keys, and represented by the same figures, having the same signification. If, then, with all these points of resemblance, the Egyptian groups are composed of the same ideas or the same elements, it may be concluded that these two nations had at one time the same system of writing and the same words; and that the Chinese characters, especially when resolved into their elements, may assist in enabling us to interpret those of the Egyptians.[2]

But in order to avoid every kind of conjecture, M. de Guignes avails himself of the information communicated by Horus Apollo, who has preserved the analysis and interpretation of several Egyptian hieroglyphs, and proposes to show that the Chinese characters, being composed of the same elements as those of the Egyptians, have also the same signification. According to Horus Apollo, the Sun and the Moon grouped together form an Egyptian character, signifying the *succession of time*, or the *first principle.* In Chinese, the same elements, the Sun and the Moon, have exactly the same signification, and mean the *succession of time, revolutions*, the *principle of all things.* In Egypt, a horizontal line crossed by a perpendicular line expressed the number *ten.* It is not a little remarkable that the Chinese employed the same character in the same sense. "Un caractère de cette espèce ne tient point à ces idées générales qui tombent dans l'esprit de tous les hommes." In Egypt, the cynocephalus symbolically indicated sadness; in China, the same figure, accompanied with the character for *voice*, signifies the same thing. To designate *education*, and an *ancient origin*, the Egyptians carved or painted a *bundle of reeds.* This symbol is founded on ideas so singular that remote nations could scarcely imagine it, much less agree as to its signification. Yet the Chinese employ a bundle of reeds in the same sense as the Egyptians, and, by using characters of this kind, show that, originally, they had communication with that people. Lastly, the Egyptians expressed *science* by the *dew which falls from heaven.* This metaphor exists in Chinese, and the character which signifies *science*, or a *learned man*, is composed of three elements or keys, one of which designates the *rain* or the *dew*, the other *heaven*, and the third *man;* a phrase which can only signify the *man on whom descends the dew of heaven.* In Deuteronomy we have the entire formula of this hieroglyph. *Concrescat ut pluvia doctrina mea, fluat ut ros eloquium meum, quasi imber super herbam et quasi stillæ super gramina.* The Egyptians compared *science* to the dew which falls upon plants and causes them to fructify; and the same imagery was employed by the Hebrews, who had lived long in Egypt, and also by the Arabians and Syrians, the neighbours of the Egyptians, and whose language naturally exhibited traces of their communication with that people.[1]

[1] Lettre de Pekin, sur le Génie de la Langue Chinoise, et la Nature de leur Ecriture Symbolique, comparée avec celle des Anciens Egyptiens, par un Père de la Campagnie de Jesus, Brussels, 1772. *Journal des Savans* for the same year. Lettre sur les Caractères Chinois, par le Révérend Père * * * *, de la Compagnie de Jesus, Brussels, 1773. This letter, however, is dated at Pekin, the 20th of October 1764.

[2] A singular circumstance has recently transpired. Signor Rossellini, the associate of M. Champollion in the Egyptian expedition, and author of the learned work entitled *Monumenti dell' Egitto e della Nubia*, already quoted, is in possession of a sort of smelling-bottle, evidently of *Chinese porcelain*, and covered with characters to all appearance *Chinese.* This curious relic was found by Rossellini himself in a tomb, which, as far as could be ascertained, had not been opened since the days of the Pharaohs. (*Quarterly Review*, vol. liii. p. 139.)

From these hieroglyphics, the import of which we learn from Horus Apollo, M. de Guignes, after showing that the Chinese have characters composed of the same elements, and bearing the same signification, concludes that those found on the monuments, having exactly the same figure and the same elements as the Chinese, must likewise have the same signification, and consequently that the hieroglyphics of Egypt may be interpreted by means of dictionaries of the ancient Chinese characters. Nor did he stop even here. Although these hieroglyphics may be explained without knowing the sound or pronunciation which the Egyptians assigned them, as happens in Chinese where the pronunciation of a character has been lost or forgotten; yet he believed it possible to recover even the sound of the hieroglyphics, that is, the spoken language of the Egyptians. But into this part of the subject it would be foreign to our present purpose to enter in detail. It may be sufficient to state, that De Guignes considered all the elements of the Egyptian and Chinese hieroglyphics as so many alphabetical letters, simple or syllabic, "faisant répondre à une seule lettre les hiéroglyphes les plus simples, et à une ou à deux syllabes ceux qui sont plus composés;" that the Chinese keys, though hieroglyphics, are at the same time letters or syllables, the combination of which forms the most composite terms that are found in all the oriental languages with the same signification; that the fixation of these keys to a certain letter or syllable is invariable in all circumstances; that the oriental letters are significative, and originated in hieroglyphics, most probably the same with those of the Egyptians; that this numerous alphabet, composed of about two hundred and fourteen figures, is identical with that which the Egyptians called *hierogrammatic* or *sacerdotal writing*, into which a greater or smaller number of *hieroglyphic characters* were inserted; and that the latter, whether *kuriological* or *symbolical*, were employed in their natural or metaphorical sense, as the case might be, the symbolic hieroglyphics being less a particular kind of writing than a symbolic style or figurative mode of expression.

Such is a rapid sketch of the highly ingenious and refined speculation of M. de Guignes. It was successively attacked by Pauw and Deshauterayes;[2] but neither of these writers seems to have perceived the real fallacy upon which the whole of this beautiful fabric is reared. The assumed identity between the Chinese elementary characters or keys, and the Egyptian hieroglyphics, is entirely imaginary; as is also the principle of combination, upon the Chinese system, extended to the latter. Nothing of this sort has as yet been discovered on any Egyptian monument. Compound ideas are expressed in the monumental writing by juxtaposition alone; nor is there the slightest evidence to show that the Egyptians had characters representative of the syllabic elements of words, or the constituent parts of ideas. It may be true, therefore, that a certain conformity is discoverable between Egyptian and Chinese customs or doctrines, and it may even be admitted that both nations had a common origin; but neither of these points can ever be considered as established by reasoning based on an erroneous assumption, nor can the identity of their language and history, opposed as it is by so many circumstances, physical, political, civil, and religious, be deduced from a few specious and plausible coincidences, such as ingenuity may easily discover between any two nations of the earth, however widely separated by time, place, and every distinctive characteristic or peculiarity. In a word, to use the language of an able writer, "on ne doit aujourd'hui regarder ce système que comme le rêve d'un homme d'esprit, qui est séduit par une idée plus brillante que solide."[3]

"Among the works of modern authors who have employed themselves in the study of hieroglyphics," says Dr Young, "it is difficult to say whether those were the more discouraging which, like the productions of Father Kircher and the Chevalier Palin, professed to contain explanations of every thing, or which, like the ponderous volume of Zoega *On the Obelisks*, confessed, after collecting all that was really on record, that the sum and substance of the whole amounted to nothing."[4] This was no doubt disheartening enough; and what added to the discouragement was, that between these extremes there existed no middle term. But the candid and honest avowal of the learned Dane ought not to deprive him of the merit which is justly due to him for the important services he has rendered to the cause of Egyptian literature. His great work,[5] if it contains no discoveries, is at least valuable as a repository of authorities and facts, and presents, in an accessible form, a mass of knowledge, which, as it cost the labour of a life to collect and arrange it, is greatly calculated to facilitate the inquiries and investigations of all who devote themselves to the study of Egyptian archæology. It is divided into five parts, which are again subdivided each into chapters and sections. The first part exhibits the testimonies of the ancients respecting the obelisks and στηλαι of the Egyptians; the second contains an enumeration and description of Egyptian obelisks, including such as have experienced fractures and other injuries, as well as those which still remain entire; the third treats of the uses of the obelisks, or the purposes for which they were erected, and records

---

[1] Mr Needham, an Englishman who, in the year 1761, had visited Turin, and examined the Egyptian antiquities in the cabinet of his majesty the king of Sardinia, appears to have come to nearly the same conclusions with M. de Guignes; though, as his claim was only put forward *three years after* the ingenious speculations of the Frenchman had been published, we have no means of determining the question of priority, unless we hold the *Lettre sur les Caractères Chinois* as a decisive authority, which we are by no means inclined to do. Having observed that the symbols, or hieroglyphic characters, on the Isis of Turin, were similar to several Chinese characters found in the Dictionary entitled *Tehing-tsee-Tong*, Mr Needham conjectured, 1*st*, That the Chinese characters might, in several respects, be identical with the hieroglyphics of Egypt; and, 2*dly*, That the sense of the hieroglyphics might be discovered by comparing with them the appropriate signification of the Chinese characters. "Les nouvelles observations de Mr Needham," says the author of the *Lettre* above referred to, "font espérer quelque chose de plus heureux pour la gloire de nôtre siècle: il a comparé les caractères Chinois avec les hiéroglyphes d'Egypte, il y a trouvé une ressemblance, du moins une analogie, qui lui fait croire qu'on pourra enfin savoir le secret des mystères de Memphis, et rompre la barrière de tenèbres qui nous empêche de faire remonter nos connoissances jusqu'au temps les plus voisins du Déluge." The author adds, "Quelle conquête pour la républiques des lettres, *si elle a jamais lieu*." The conquest would, no doubt, have been great, if it had ever been made; and we know no other obstacle to its accomplishment except that the thing proposed is manifestly impossible. From all that we have been able to learn on this subject, it appears that the road to Memphis does not pass by Pekin.

[5] *De Origine et Usu Obeliscorum*, ad Pium Sextum Pontificem Maximum, auctore Georgio Zoega Dano. Rome, 1797, in large folio.

History.

the different opinions which have been promulgated on this subject by Kircher, Goguet, the members of the Academy of Inscriptions, Bruce, and many others, including Jablonski, Mercatus, Bergæus, and others; the fourth is devoted to the consideration of the origin of these monuments, and, in particular, embraces the author's views, or rather collections, respecting the origin and use of letters amongst the Egyptians; the fifth and last treats of the history of the obelisks, and of their various epochs. As a digest of all the learning and information on the subject which existed at the time of its publication, this work is therefore of the highest importance; and its value is greatly enhanced by the beautiful and accurate engravings with which it is accompanied. Zoega has indeed left little to be gleaned in the field which he undertook to reap; he has gathered into one great storehouse, for the use of those who may succeed him, a vast body of knowledge which previously lay scattered over an immense surface, or concealed in nooks and corners; and he has so arranged and methodized his collection as to render its materials easily accessible to every inquirer. Nor have the discoveries latterly made in Egyptian literature superseded or antiquated the labours of this indefatigable scholar. On the contrary, these have acquired additional importance from the circumstance that, whilst an entirely new direction has been given to learned curiosity, the persons engaged in prosecuting those discoveries have been spared the fatigue of much collateral research, and been placed in a much more favourable position than they could possibly have occupied, if no such work as this had been in their hands.

But whilst Zoega studied practical utility, or at least sought to render knowledge more generally available, others indulged only in speculation. But this now took a direction somewhat different from that in which it had previously flowed. The Abbé Pluche, for instance, in his account of the symbolic writing of the ancient Egyptians, maintains stoutly that the whole of it consists of emblems, expressive of doctrines connected with the science of astronomy and the division of time in the calendar; and his followers (for he had not a few in this country, as well as on the Continent), so far from being startled with the incoherence of his views and the arbitrary violence of his explanations, came to the conclusion that the innumerable inscriptions which cover the Egyptian monuments are all referrible to a single science, and in fact to one and the same order of ideas. With inquirers of this class the only signs in favour were the signs of the zodiac. In every legend, in every cartouche, they discovered astronomical emblems expressive of astronomical truths. According to their interpretations, indeed, the whole business of life, in ancient Egypt, must have consisted in studying the heavens, and translating into obscure or doubtful symbols the results of this continued celestial observation. But the author of the work entitled *De l'Etude des Hiéroglyphes*, published at Paris in 1812, took a different, though not more irrational, view of the subject. Believing it possible, by the aid of ancient traditions, and a knowledge of the symbols and emblems employed by different nations, to arrive at some general principle which might serve as a key to the Egyptian inscriptions, he formed a collection of what he calls *les symboles des peuples*, or popular symbols of Africa, Asia, and America; and having applied it to the interpretation of the hieroglyphics of Egypt, he had the singular happiness to discover, on the portico of the great temple at Denderah, not a dedication to Isis, but a translation of the hundredth psalm of David; one of the last compositions, certainly, which we should have expected to find in such a place. Nor is this the only discovery of the kind which we have to record. The anonymous author of the *Essai sur les Hiéroglyphes Egyptiens*, not content with supposing that the hieroglyphics express emblematically a series of ideas analogous to those which are found in the Bible, maintains that they are neither more nor less than simple letters, and that, considered as such, they express words in the Hebrew language. But, as the number of distinct characters upon the monuments falls little short of a thousand, he has not explained how the Egyptians happened to have so copious an alphabet, exceeding the Chinese elementary characters or keys in the proportion of three to one; how this alphabet applied to Hebrew, a language, all the words of which consist of various combinations of twenty-two elementary sounds; and how the Egyptians came to inscribe their monuments with a foreign language which they never spoke, and most probably did not understand.

Theorists discover no difficulties, or, if they do so, disregard and overleap them. We have already seen that Kircher's method of interpretation succeeded equally well, whether he happened to begin at the beginning or at the end of an inscription; and the same thing might no doubt be predicated of that method which proceeds on the assumption that *all* the hieroglyphics are letters expressive of words in the Hebrew language. But the sagacity of this class of interpreters has in some cases conducted them to very opposite results. The Chevalier Palin, for instance, beginning by way of variety in the middle of the inscriptions, discovered that Hebrew translations of many of the Egyptian rolls of consecrated papyrus are to be found in the Bible under the name of the Psalms of David. The author of the Essay above mentioned, and the ingenious chevalier, therefore, though proceeding on nearly the same principles, have arrived at very different results. According to the one, the hieroglyphics are letters, and the language of the Egyptian inscriptions is Hebrew; according to the other, the Psalms of David are, in part at least, composed of translations from the consecrated rolls of papyrus inscribed with pure Egyptian. The one makes the Egyptians borrow every thing from the Hebrews; the other makes the Hebrews borrow a great deal from the Egyptians. But, whatever may be thought of the judgment of these antiquaries, their opinions are not particularly discreditable to their talents and ingenuity. For, having once allowed themselves to set out with the notion that it was possible to determine the sense of the hieroglyphics by internal evidence, the imperfections of their superstructures were the unavoidable consequences of the unsubstantial nature of the foundations on which they were raised.[1]

It is not a little mortifying to the pride of human skill and learning, that the key which had long been sought for in vain was at length in some measure discovered in consequence of the accidental disinterment of a single block of stone, which for ages had lain under ground. It is well known that the French expedition to Egypt was accompanied by a commission of the National Institute, most liberally provided by the government of the day with the requisite means for investigating all that related to science or to literature in that wonderful country. In the proceedings of this body the general-in-chief, Napoleon, took the greatest interest; he seemed to consider his glory as not less concerned in the illustration than in the conquest of Egypt; and, amidst all the cares and distractions of his situation, he was unremitting in his endeavours to promote the objects for which the commission had been appointed. The labours of this body were at length made public, with all the elegance which the arts of printing and engraving could communicate; and the splendid work entitled *Description de l'Egypte* will be an enduring monument of republican liberality and imperial magnificence. But although much was thus effected in elucidation of the history, antiquities, religion, institutions, and arts of ancient Egypt, not a single ray of new light was shed on the language and letters, the hieroglyphics and papyri, of that singular country; and the principal benefit which the learned of Europe derived from the publication of this national work consisted in the multiplication of hieroglyphic texts, engraved, for the most part, with equal beauty and accuracy. These, however, were unavailing for the advancement of Egyptian literature, as long as the true method of interpreting them, either in whole or in part, remained unknown; and it must have been felt by the French as not a little humiliating to their vanity, that an *accident*, which occurred in the course of their military labours, and of which the fortune of war afterwards denied them the benefit, should have conduced more towards the elucidation of the monumental inscriptions of Egypt than all the labour, research, and ingenuity which had for ages been expended on them. Whilst a division of the French troops occupied the town of Rosetta, a party of workmen, employed in digging for the foundations of Fort St Julian, discovered and disinterred a huge block or pillar of black basalt, exhibiting the remains of *three* distinct inscriptions; but the French being soon afterwards dislodged by the British, were prevented from removing this monument, which consequently fell into the hands of the conquerors, and was subsequently brought to England, amongst other trophies of the Egyptian campaign, and deposited in the British Museum.[1]

---

[1] Young, *Recent Discoveries in Hieroglyphical Literature*, p. 3.

A cursory inspection of the Rosetta inscription was sufficient to establish the truth of the opinion which had been expressed by Warburton, that the hieroglyphics constituted a real written language. Of the three inscriptions sculptured on its sides, a considerable part of the first was unfortunately wanting; the beginning of the second and the end of the third were also mutilated; but the last, written in Greek, concluded with the important information that the decree inscribed on the monument, in honour of Ptolemy Epiphanes,[2] had been ordered to be engraved in *three* different characters, namely, the *sacred* or hieroglyphic, the *enchorial* or letters of the country, and the *Greek*. Here, then, was an authentic specimen of the hieroglyphic characters, *expressly accompanied by a Greek translation*.[3] But before any use could be made of the Greek version, it was obviously necessary that it should be carefully examined, and, as far as possible, restored. With this view the Society of Antiquaries caused a correct copy of the triple inscription to be engraved and circulated, and Porson and Heyne, the two best scholars of the age, employed themselves in completing and illustrating the Greek text; a task, in the performance of which the superior industry and vigilance of the German gave him a decided advantage over the more active and irregular genius of the English Hellenist. But no data had as yet been obtained, by means of which a comparison might be instituted between the Greek which Heyne had restored, and the hieroglyphical or enchorial texts, of which not a single character was known. There existed indeed a traditional record of the true value of a particular character, denoting *life*, which had been handed down by the ecclesiastical writers, and had been generally received as accurate by scholars and antiquaries; but beyond this nothing whatever was known, whilst the explanations given by Horus Apollo in his *Hieroglyphica*, were somewhat hastily set down as mere puerilities. In these circumstances, there remained but one course to be adopted; namely, to adjust the inscriptions, so that they might as nearly as possible coincide, and, from the situations of the proper names in the Greek inscription, to endeavour attentively to ascertain their corresponding positions in one or both of the other inscriptions. By this means, if characters merely phonetic entered into the composition of the hieroglyphic and enchorial texts, the true value of some of them would be ascertained; but if these texts were found to consist chiefly of characters not phonetic, it was at least probable that the proper names would be written alphabetically, and that, even from the comparison of these, some important inferences might be deduced. It was, therefore, a matter of indifference whether the comparison was first made between the Greek and hieroglyphic, or between the Greek and enchorial text; but as a notion happened to prevail that the enchorial was altogether phonetic, the first attempt was made upon that part of the triple inscription.

The Baron Silvestre de Sacy, justly celebrated for his eminent attainments both as a scholar and as an antiquary, had the honour of taking the lead in this investigation. Having examined the portions of the enchorial text corresponding, by their relative situations, to two passages of the Greek inscription, in which occur the proper names ALEXANDER and ALEXANDRIA, he soon recognised two well-defined groups of characters nearly resembling each other, and which, he conjectured, were the enchorial representatives of these names. He also made out satisfactorily the *locus* or position of the proper name PTOLEMY; but beyond this he found it impossible to advance a single step, and ultimately abandoned the pursuit as hopeless. M. de Sacy, however, had not laboured in vain. He had, in some degree, determined the positions of three proper names; and, what was far more important, he had shown that the investigation, which he gave up in despair, was not so impracticable as he had imagined. Mr Akerblad,[4] accordingly, resumed the inquiry at the point where it had been abandoned by his predecessor, and completely demonstrated the truth of what M. de Sacy had done little more than conjecture, namely, that the enchorial text contained Greek proper names written in Egyptian characters. Continuing his comparative readings, Mr Akerblad subsequently attempted from them to construct an alphabet; but, excepting in as far as regarded the proper names, whence he deduced about fifteen characters, the attempt proved a failure, partly because he had imbibed the notion that the whole inscription was alphabetical, and partly, too, from expecting to find in the Egyptian writing all the vowels which the same words contain in the Coptic texts still extant; an error which a due consideration of the practice observed in the Hebrew, Chaldaic, Arabic, and other written oriental languages might have enabled him to avoid. Mr Akerblad contributed nothing towards the elucidation of the first or hieroglyphic inscription on the Rosetta monument, if we except a detached but acute observation respecting the three numerals at the end; and it is even alleged that he was disposed to acquiesce in the correctness of Palin's interpretation, which proceeds upon the supposition that parts of the first lines of the hieroglyphics still remain on the pillar.[1] Be this as it may, however, to M. de Sacy and to Mr Akerblad, particularly the latter, belongs the distinction of having made the first advances in the right direction. The progress of discovery is for the most part gradual, and it requires successive efforts to clear much ground in a domain where there are no landmarks to guide the explorer, and where, in puzzling his way through the wrecks of ages, his own natural sagacity is at every instant liable to be bewildered by the fancies, errors, or exaggerations of those who have preceded him. But if there be any truth in the observation, *ce n'est que le premier pas qui coute*, the merit due to these distinguished individuals will never cease to be fully acknowledged by the historians of hieroglyphical discovery.

---

[1] Young, *Discoveries in Hieroglyphical Literature*, p. 5.

[2] It hence appears that the hieroglyphical method of writing continued to be understood and employed in the time of Ptolemy Epiphanes, that is, two centuries before Christ. At what time it ceased to be so has not been ascertained.

[3] The concluding words of the Greek, as restored by Porson, are these: [Το δε ψηφισμα τουτο ἀναγραψαι εἰς στηλην μελανος σ]τερεου λιθου, τοις τε ἱεροις, και ἐγχωριοις, και ἑλληνικοις γραμμασιν· και στηλαι ἐν ἑκαστῳ των τε πρωτων και δευτερω[ν θεων ἱερῳ. Thus translated by Heyne: "Et incidere hæc in *duro* (Porsonus vult *nigro*) lapide, Sacris, et Patriis, et Græcis litteris; et statuere in unoquoque et prioris et secundi ordinis templo."

[4] A diplomatic gentleman then resident at Paris, but afterwards the Swedish chargé d'affaires at Rome. Having resolved into its component parts the group representing ALEXANDER, and ascertained that other groups signified PTOLEMY, ARSINOE, BERENICE, and other proper names occurring in the Greek part of the triple inscription, Mr Akerblad published the alphabet which he had collected from these names, containing about fifteen well ascertained characters. He then applied himself to decipher the remainder of the inscription, which, he hastily took it for granted, consisted of Coptic words expressed in alphabetical characters; but in this attempt he was completely unsuccessful. The greater part of the characters which he met with in the inscription were not such as had occurred in the proper names; nor could he obtain a series of Coptic words by assigning to the new characters any powers that he could think of or imagine. He appears never to have suspected that the words of the inscription could be any other than Coptic, or that these words could be represented otherwise than phonetically. (See an excellent paper on the *Enchorial Language of Egypt*, in the third number of the *Dublin University Review*, p. 4.)

Matters were in this state when Dr Young commenced his investigations. Little or nothing had as yet been done to interpret the sacred characters, or hieroglyphics; but the germ of all the succeeding discoveries may be said to have been found, when the idea had once been suggested of fixing the positions of the proper names, and considering the corresponding groups of figures as representing their constituent sounds. Having been induced, as he informs us, to offer to the conductors of a periodical publication an article containing an abstract of the *Mithridates* of Adelung, a work then recently received from the Continent, his curiosity was forcibly excited by a note, in which the editor, Professor Vater, asserted that the unknown language of the Rosetta inscription, and of the bandages often found with the mummies, was capable of being analysed into an alphabet consisting of little more than thirty letters; but having retained merely a general impression of this bold and striking assertion, he thought no more of these inscriptions until early in 1814, when they were recalled to his attention by the examination of some fragments of papyrus which had been recently brought to England by Sir W. R. Boughton, and on which, after a hasty inspection of Mr Akerblad's pamphlet, he communicated some anonymous remarks to the Society of Antiquaries. His interest in the subject being thus awakened and stimulated, he, in the summer of the same year, applied his mind first to the enchorial, and afterwards to the hieroglyphic inscription; and, by a methodical comparison of the different parts with each other, he was able, in the course of a few months, to send to the *Archæologia* a "conjectural translation" of each of these inscriptions, distinguishing the contents of the different lines with as much precision as his materials then enabled him to attain. He was obliged, however, to leave many important passages still subject to doubt; but he hoped to acquire additional information before attempting to determine their signification; and having fairly broken ground, he flattered himself that he would soon be in a condition to advance with facility and rapidity. In the meanwhile, he endeavoured to make himself familiar with the Memphitic and Thebaic versions of the Scriptures. Aware, from the researches of Quatremère, that the remains of the ancient Egyptian language are preserved in these versions, he hoped, with the aid of this knowledge, to read the enchorial inscription, at least, into a kindred dialect; and although he felt himself gradually compelled to abandon this expectation, he soon afterwards published anew, in the *Museum Criticum* of Cambridge, his conjectural translation, with considerable additions and corrections. Lastly, in the article EGYPT, printed in the fourth volume of the Supplement to the former editions of the present work, he digested in a methodical form the results of his researches, and, in particular, inserted a Vocabulary containing upwards of two hundred names, words, or epithets, which he had succeeded in deciphering in the hieroglyphical and enchorial texts, with some additions derived from his readings in the Egyptian manuscripts. This article, forming altogether an astonishing effort both of scholarship and ingenuity, was published in December 1819, and almost immediately attracted the attention of the learned throughout the whole of Europe. With the exception of the slight aids afforded by the researches of De Sacy and Akerblad, neither of whom had been able to decipher a single character of the *hieroglyphical* inscription, it had the merit of complete originality;[2] and hence it was not only received with admiration by all who were capable of appreciating its merits, but it produced a general rush to the study of hieroglyphical literature, and mainly contributed towards those further discoveries, of which it will be our business to render some account in a succeeding section of this article.

Although much has been done for the elucidation of the Egyptian texts, monumental as well as enchorial, since Dr Young published this record of his investigations; although some errors have been corrected, many additions made, and the whole reduced into a systematic form; yet we should consider ourselves as unjust to the memory of that most ingenious man, and as even guilty of removing one of the great landmarks of learning, were we, in this new and improved edition of the Encyclopædia, either to withhold or to alter a production which, in fact, constitutes an epoch in the annals of letters. For this reason all that part of the article above mentioned which was devoted to the subject of hieroglyphics, is republished entire in the third, fourth, and fifth sections of this general treatise; accompanied only with a few explanatory and corrective notes, intended to keep in view what has been effected by others, and also to prepare the reader for the expositions which follow. We have only further to add, upon this head, that the historical and critical view of the progress of opinion and discovery on the subject of hieroglyphics, which we have here brought down to the period at which the researches of Dr Young were given to the world in a somewhat matured form, will be continued in the explanation of the various systems which have since been promulgated by those who have endeavoured either to extend or to overthrow the principles upon which Dr Young conducted his investigations. But, in the meanwhile, we shall so far interrupt the development of our general plan as, in the next section, to submit to our readers an abstract of the facts and arguments by which the substantial identity of the different dialects of Coptic with the language of ancient Egypt has, in our opinion, been completely established, and an obstacle which might have impeded the future progress of investigation thus cleared away.

---

[1] This supposition is contrary to the fact. As already stated, the commencement of the hieroglyphic inscription is wanting.

[2] "Dr Young," says Mr Salt, "seems to me to stand alone with regard to the *progress* he has made in the enchorial, as well as for his having *led the way* to the true knowledge of hieroglyphics." (*Essay on the Phonetic System of Hieroglyphics*, p. 1.)

II. IDENTITY OF THE COPTIC DIALECTS WITH THE ANCIENT LANGUAGE OF EGYPT.

Language is, after all, the most durable of human monuments. Conquerors may overthrow empires and states, earthquakes may swallow up cities, time may confound all things besides; but the winged words in which man gives utterance to his feelings and thoughts often outlast all these ravages, and preserve the memory of nations long after they have ceased to exist. That which seems the most fragile, the most variable, the most evanescent of human attributes or possessions, becomes in reality the most permanent, the most indestructible. If no longer able to support an independent existence, it clings to and coalesces with some more recent and robust dialect; if lost in one form, it is almost certain to re-appear in another, exhibiting, amidst all changes and disfigurations, incontestible traces of its origin. This law of decay and reproduction, of fluctuation yet permanence, is so general, we might almost say universal, that it is principally from analytical inquiries into the origin, composition, and affinities of language, that we derive what knowledge we possess of the early history and fortunes of nations. It is impossible, therefore, to believe that the form of speech which long prevailed in ancient Egypt can have utterly perished, or that remains of it may not still be discovered in one or other of the dialects in which it appears to have merged. The Persian, the Macedonian, the Roman, the Arabian, and the Ottoman conquests, have successively discharged their fury upon that devoted country; and even those monuments which seemed destined to receive the epitaph of Time itself, are mouldering and crumbling into ruin; but, unlike the temples, palaces, and piles stupendous, which once adorned the valley of the Nile, the language of the Pharaohs, though greatly mutilated, has been arrested in its decline, and all of it that remains has long since been placed beyond the reach of further injury.

If the case, however, were different from what is here stated; if the language of ancient Egypt had perished as completely as the dialects spoken before the Flood; still it would not be impossible to obtain some knowledge of those inscriptions which have so much occupied the attention of the learned both in ancient and in modern times. With the aid of such monuments as those of Rosetta and Philae, in which the hieroglyphical texts are rendered into a known language, we should still be able, if not to read those texts into the language which they originally represented, at least to determine inductively the values of the principal characters, or groups of characters, of which they are composed; and we should thus, to a certain extent, be provided with the means of attempting empirical explanations of texts unaccompanied with versions. Nevertheless it is undoubted that such an ancient language, even if it had ceased to exist independently, and if its remains were only to be found mixed up in another dialect, perhaps blended with heterogeneous elements, would, on being separated from all extraneous forms, prove eminently serviceable in facilitating inquiries, having it for their object to explain the monumental inscriptions and other Egyptian texts. The value of such an auxiliary, indeed, can only be fully appreciated by those who have devoted themselves to these laborious and difficult investigations; but, from the explanations and details which are contained in the succeeding sections of this treatise, even the general reader will be enabled to form a tolerably just idea of its importance. In the meanwhile, that no branch of this subject may be left unexplained, we shall endeavour to state, as briefly as possible, the grounds upon which we hold it to be demonstratively certain that the Coptic and the ancient Egyptian are substantially identical.

There can be no doubt that the Egyptian language and characters subsisted under the Ptolemies. If the Greek alone was in use at the court of these princes, and in the city of Alexandria, the capital of their empire, it cannot be disputed that in the more remote towns, and particularly in the Thebaid, the Egyptian language continued to be understood and spoken as formerly. This fact, attested by the Rosetta inscription, is confirmed by a passage of Plutarch, in which he relates that Cleopatra, the favourite of Cæsar and of Antony, replied, without the intervention of an interpreter, to the Ethiopians, the Troglodytes, the Hebrews, the Arabians, the Syrians, the Medes, and the Parthians, and that she also understood the languages of many other nations; whilst the kings, her predecessors, had scarcely given themselves the trouble to learn the Egyptian, and some of them had even neglected the Macedonian.[1] That a barbarous people may adopt the laws, and even the language, of their conquerors, is what may easily be believed; but it is altogether incredible that a civilized people like the Egyptians, strongly attached to their own usages, and proverbially averse to those of strangers, should have abandoned or corrupted their language, in which a great number of works had been composed; more especially as the Greek princes who governed Egypt after the death of Alexander do not appear to have, in any respect, interfered with or opposed the prejudices or inclinations of their subjects in favour of their vernacular idiom. If, during the lapse of a certain period, little is to be found respecting either the existence or the condition of the Egyptian language, it should be recollected that the history of Egypt during this period is very little known, and that the greater part of the works which would have thrown light on the reign of the Ptolemies have unfortunately perished.

But it is nevertheless certain that, under the dominion of the Romans, the Egyptian continued to be the language of the people. Origen, in his treatise against Celsus, observes, that "if a Greek desired to teach any useful doctrine to the Egyptians and Syrians, he would prefer learning the barbarous languages of those nations, to being wholly unintelligible by addressing them in Greek." The same father, in another place, asks why the fables which the Greeks derive from the subject of their gods, should be regarded as more worthy of credit than those of the Egyptians which have sprung from a similar source, or what rational ground there is for preferring Mnemosyne mother of the Muses, Themis mother of the Hours, Eurynome mother of the Graces, and other Greek names, to those which have been consecrated by the mythology of ancient Egypt. Nor are these the only proofs that the Egyptian language still continued to be understood. The Emperor Severus caused all the books which treated of the occult sciences to be removed from the temples of Egypt, and placed in the tomb of Alexander, that no one might in future either see the body of that prince, or read what had been written in those books. We learn from Capitolinus that the Roman soldiers raised a tomb to Gordian, on which they engraved an inscription in Greek, Latin, Persian, Hebrew, and Egyptian characters, in order that it might be read by all the world. The Emperor Diocletian, irritated at the Egyptians on account of their revolt, caused all the books on chemistry composed by their learned men in ancient times to be searched out and con-

---

[1] Τῶν ϖϱο αὐτης βασιλεῶν εὐδε την 'Αιγυϖτιων ἀνασχομενων ϖεϱιλαβειν διαλεκτον, ἐνιων δε κὰι το Μακεδονιζειν ἐλιποντων. (Plutarch *in Vita Antonii*, tom. i. p. 913, ed. Ruald.)

Coptic.

signed to the flames, from an absurd apprehension that the people might acquire riches by means of this art, and be again in a condition to rise against their oppressors. Lastly, from the first ages of Christianity, the books of the Old and New Testament had been translated into the Egyptian language.

The greater part of the learned, Lelong, Renaudot, Wilkins, Münter, Woide, and Georgi, are of opinion that this version existed in the second century; and Woide even attempts to prove that the composition of the famous Sahidic manuscript of Dr Askew, entitled ΤΠΙΣΤΗ ΣΟΦΙΑ,[1] *Sapientia Fidelis*, containing the philosophy of the Gnostics, is to be referred to the same epoch. Picques thinks that the Coptic translation of the New Testament, which we now possess, was executed in the fifth century, when those who desired to be considered learned, or had connections with Alexandria, cultivated an acquaintance with the Greek or Latin, although the greater number spoke nothing but Egyptian. Paul the hermit, according to St Jerome, was equally conversant with the Egyptian and the Greek tongues. St Antony knew only Egyptian, in which language he addressed to different monasteries several letters, of which Mingarelli has published two fragments written in the Sahidic dialect. The author of the acts of St John and St Simeon, who suffered martyrdom under Diocletian, informs us that he wrote his history with his own hand, and then caused it to be translated into Egyptian by a copyist called Menas. Palladius and Rufinus were equally skilled in Greek, Latin, and Egyptian literature; and the former mentions that the abbot Apollo selected three men possessing the same accomplishments (*ἐμπειρους της Ἑλληνικης, και Ῥωμαϊκης, και Ἀιγυπτιακης διαλεκτου*). Joseph of Thmuis understood thoroughly, not only the Egyptian, but also the Greek. Jerome informs us that, in the Egyptian, the word PSONTOM-PHANEC signified *Saviour of the world*, and that, in the native idiom, Egypt was still denominated *Ham*. Pachomius, in his infancy, was taught Egyptian by his parents, and never knew any other language, as appears by the history of his life. To those of the brethren who understood not Egyptian, Theodorus acted as interpreter, and explained the discourses of Pachomius; he also translated into Egyptian the letter addressed to him by St Athanasius. In the Coptic acts of the martyrdom of St Apater, it is stated that the governor of the Thebaid addressed a communication to that saint in the Egyptian language. The Syriac author of the life of St Ephrem mentions that this saint, having undertaken a journey to Egypt, went to visit St Bischoï, but as they understood only each his mother tongue, it would have been impossible for them to converse together, if God had not granted to Bischoï the gift of speaking Syriac, and to St Ephrem that of explaining himself in Egyptian. Dioscorus, patriarch of Alexandria, in his eulogium on the bishop of Tkôou, with whom he travelled to the council of Chalcedon, states expressly that the latter knew only Egyptian. "As I understood not his conversation, the deacon Peter," says he, "acted as our interpreter." He adds, "The deacon Theopistos said to me, What shall we do with this mute, ATHROF, who has embarked with us? Are the heretics Egyptians, that he should have been sent to dispute with them?" Lastly, the author of an Arabic note inserted in a Coptic manuscript, preserved in the King's Library at Paris, informs us that, before the invasion of the Moslemins, it was the custom in Egypt, in the celebration of the offices, to read in Greek the lessons of Scripture, and to explain them in Coptic; and it appears from a fragment published by Georgi, that the inhabitants of Upper Egypt recited in both languages litanies, and other parts of the liturgy.

These authorities, and others which might be produced, leave no doubt whatever as to the preservation of the Egyptian language down till the period referred to in the last of them; it had in fact survived all casualties, and it co-existed with the Greek, even in the service of religion, without being displaced or abrogated by that polished idiom. But it is nevertheless true that the Coptic presents us with a multitude of Greek words, and that the actual alphabet of the language is almost entirely Greek, having retained only a small number of Egyptian characters, which it appears to have borrowed from the enchorial or current writing of ancient times. Are we then to conclude that this language is only a corruption or off-set of the Greek? It would be quite as reasonable to maintain, with Kircher, that Greek is derived from the Egyptian, or to pretend that the Persian language is only a dialect of the Arabic. Foreign terms introduced into a language change not either its nature or its form, any more than the food introduced into the body, though composed of the most diversified ingredients, makes any change in the personality or identity of the individual who receives it. Of this the English is a living and remarkable proof. The intermixture of Greek words in the Egyptian language is attributable to several causes. In the first place, a new form of government having been established in Egypt, first under the Ptolemies, and then under the Romans, the Egyptians were under the necessity of borrowing from the language the names of dignities, and all the terms which had reference to the administration. Secondly, the Christian religion having early penetrated into Egypt, introduced into that country a multitude of ideas altogether new and strange to the inhabitants, and which, consequently, could not be expressed by the words of their language; besides, several terms had been consecrated by religion, and a reasonable apprehension was entertained lest they should lose their true and proper signification by being translated into another idiom. It was necessary, therefore, to have recourse to the Greek, which was the language of the first preachers of the Gospel, and in which indeed were contained all the fundamental books of the Christian faith. Thirdly, some of those who translated Greek works into Egyptian, found it no doubt convenient, when they either happened not to understand a word, or could not readily find a Coptic equivalent, to leave it as it stood in the original; whilst others, to display their knowledge of both languages, employed indifferently Greek or Egyptian words. It must not, however, be supposed that all the Coptic books which we possess contain an equal number of Greek expressions: these are sometimes of more and sometimes of less frequent occurrence: but, in general, it may be observed that comparatively few can be cited, the equivalents of which were to be found in the Egyptian, a circumstance which M. Quatremère had frequent occasion to verify.

But a question here arises, namely, at what period the Egyptians renounced their ancient mode of writing, whether phonetic or other, to adopt the Greek alphabet, augmented by some letters borrowed from the enchorial characters. On this subject the learned are much divided. Some, as Lacroze and Father Georgi, carry the change as far back as the reign of Psammeticus; but this hypothesis is refuted by the date of the inscription of Rosetta, namely, the reign of Ptolemy Epiphanes, when the ancient methods of writing were still employed. Bonjour fixes it at the epoch of the conquest of Egypt by Alexander; Montfaucon, Jablonski, and Valperga, are of opinion that it took place under the Ptolemies; Schow thinks that the introduction of the Coptic alphabet was considerably anterior to our era;[1] whilst Zoega, founding on a passage of Aristides relative to the word Κανωβος, concludes that the Greek characters were not adopted in Egypt before the third century; an opinion which is confirmed by the passage of Capitolinus already referred to, where that author speaks of the inscription engraved upon the tomb of the Emperor Gordian, "Græcis, et Latinis, et Persicis, et Judaïcis, et *Ægyptiacis literis.*" By the Egyptian characters here mentioned cannot be understood the Greek letters, which are expressly distinguished; nor can the sacred characters, or hieroglyphics, be meant, because, even supposing that this kind of writing was known and understood in Egypt at the period referred to, it must have been within the reach of too small a number of persons to be employed in an inscription intended to be read by all the world (*ut ab omnibus legeretur.*) It appears, then, that the Egyptian letters here mentioned are the *demotic* or *enchorial* characters, and that these remained in use amongst the people of Egypt at the time of Gordian's death, which, according to the calculation of Tillemont, took place in the year 244, or about the middle of the third century of the Christian era.

---

[1] The want of Coptic characters renders it necessary in this, and will oblige us, in other instances, to employ the Greek letters.

The Egyptian language was divided into three dialects: the Coptic of Misr, which is the same with the Sahidic; the Bahiric, so called from the province of Bahirah; and the Bashmouric, which was at one time in use in the province of Bashmour. But the only forms now in use are the Bahiric and the Sahidic, both of which dialects are derived from one and the same radical language. The Bahiric, also denominated the Memphitic, is easily distinguishable from the Sahidic, the differences which exist between them being known; and the former was the language of Lower Egypt, whilst the latter was that of the Thebaid or Saïd. But of these two dialects, which is the more ancient? This is a question which it is exceedingly difficult to resolve, as the historical monuments throw no light on the subject, and we are consequently reduced to mere conjecture. Macrizy, Renaudot, Lacroze, and Jablonski, regard the Sahidic dialect as the more ancient; but Georgi has contended for the priority of the Memphitic, and his opinion is also that of Valperga and of Münter. Mingarelli, however, has not ventured to decide the question either one way or other; but it may not unreasonably be supposed that the Thebaic or Sahidic dialect, in which are written the most ancient monuments extant in the Coptic language, and of which mention is made in the life of Pachomius, and perhaps also the Bashmouric, existed primitively in the Egyptian language, at the same time with the Memphitic. If, as Georgi has demonstrated, the Egyptian words, transmitted to us by the ancient authors, appear to have been for the most part borrowed from the last of these dialects, this circumstance ought to excite no surprise; for, as neither the Greeks nor Latins had many occasions to penetrate into the Thebaid, which was remote from the court and the centre of administration, the language of that province must have been less known to them than the dialect of Lower Egypt, which they were accustomed to hear spoken. Besides, the Thebaic dialect, which is a less cultivated form than the Memphitic, was not perhaps in use at this time, excepting in the villages, or in towns of the smallest class. But that the Memphitic dialect was in reality richer than the Sahidic remains to be proved; in fact, the latter, besides a sufficiently large number of words which properly belonged to it, had the distinctive peculiarity of readily adopting, with a slight change, all the Memphitic words. If the Thebaic manuscripts, then, appear to exhibit a greater number of Greek expressions, this intermixture, which is no doubt attributable to the caprice of the writers, and to the operation of the other causes already specified as affecting the Coptic generally, does not appear to have had much influence on the usage of the language; otherwise they would not have taken the precaution, in the Sahidic lexicons, of explaining the Greek words by native terms, a practice which, as far as we have observed, has not been followed in any of the Memphitic vocabularies.

But it has been objected, that, if the Coptic language represents, or is substantially the same with, the ancient Egyptian, we ought to discover in it the roots or original forms of all the Egyptian words which have been transmitted to us by the Greek or Latin authors; whereas it is not denied that the etymologies proposed by the learned who have occupied themselves with such researches are very far indeed from being all equally fortunate or successful.[2] In answer to this objection, which appears plausible and embarrassing, we have to observe that we admit the premises, but dispute the validity of the conclusion deduced from them. 1*st*, The search for etymologies is of itself extremely hazardous and conjectural. If Varro the most learned of the Romans, Servius the commentator of the Æneid, and the other Latin grammarians, were mistaken as to the origin of many words in their own language; if, in the French language, there exists a great number of terms, the etymology of which cannot now be discovered; and if Ménage, notwithstanding his vast erudition, has fallen into a multitude of errors on this subject; can it be wondered that the same thing should occur in the case of a foreign language which has been dead for centuries, and of which but few monuments have been preserved? 2*dly*, All the terms of the ancient Egyptian with which we are acquainted have been transmitted to us by the Greeks or the Romans, who, for the most part, were absolutely ignorant of that language; consequently, part of the explanations which they have given was probably conjectural, and, when they furnish no interpretation at all, the difficulty is still greater. Before attempting to trace these words, we would require to be certain as to the true readings; but how can such certainty be attained in regard to terms collected by foreigners, disfigured by a vicious pronunciation, and afterwards altered by the negligence of the copyists? It appears, also, from the contradictory explanations which the ancients have left of the names of Osiris and other divinities, that the Egyptians themselves had no very definite ideas as to the origin of many words in their language; and that their etymology, every authentic trace of which has now disappeared, was sometimes abundantly arbitrary. 3*dly*, It is possible that several of the Egyptian words which the ancients have transmitted to us belonged to the sacred language, the knowledge of which was confined to the priests, whilst the terms were employed in a sense different from that which was attached to them by the vulgar. 4*thly*, If, as has already been observed, the Christian re-

[1] But he adds a qualification: "Tempus autem quo hæc unio alphabeti Græco-Ægyptii cum antiquo Ægyptio facta fuerit, deficiente omni auctoritate historica, adcurate definiri nequit." (Schow, *Charta Papyracea*, p. 118. Rome, 1788.)

[2] "On peut être surpris," says M. Akerblad, "que les savans comme Lacroze, Jablonski, et autres, qui ne connoissoient qu'une partie des ouvrages Coptes que nous possédons aujourd'hui, se soient imaginé qu'avec ces foibles moyens ils pourroient retrouver dans l'Egyptien moderne les étymologies de tous les noms des divinités Egyptiennes: aussi pas une seule des étymologies qu'ils ont proposées relativement aux noms des divinités dont il est fait mention dans le monument de Rosette, ne se trouve confirmée par ce monument." (*Lettre sur l'Inscription de Rosette*, p. 51.)

Coptic.

ligion introduced a great number of Greek words into the Egyptian language, it must at the same time have abolished and caused to disappear all the terms which relate to the ancient mythology.[1] *5thly*, We have already seen that the language of Egypt was divided into three dialects; the Memphitic or Bahiric, the Thebaic or Sahidic, and the Bashmouric. But, of these three dialects, the first is that of which we have the most information, though our knowledge of it is very far from being complete. The Sahidic we possess in a very imperfect state, whilst the monuments written in that dialect, and known in Europe, are still but few in number. The Bashmouric is so completely unknown, that M. Quatremère, with all his research, succeeded in procuring only a single word of this dialect,[2] which M. Champollion, nevertheless, quotes with confidence as an existing form of the Coptic.

But a revolution equally rapid and complete suddenly changed the political condition of Egypt. The Arabians, whom Mahommed had inspired at once with fanaticism and the spirit of conquest, abandoned their arid deserts, destroyed the monarchy of the Persians, and seized on the finest provinces of the Greek empire. In the twentieth year of the hejira, Amru-ben-el-As, general of Omar, one of the successors of the Prophet, entered Egypt at the head of a body of Moslemins; and as that country was then distracted by the religious dissensions of the orthodox Greeks (Melkites), who adhered to the council of Chalcedon, and of the native Egyptians (Jacobites), who were its implacable enemies, he found little difficulty in uniting it to the empire of the Arabians. Amru, equally politic and brave, whilst he waged an exterminating war against the Greeks, endeavoured by every means to conciliate the good-will of the Egyptian Jacobites; and, with this view, having recalled their patriarch Benjamin, who, under the reign of Heraclius, had been driven from his see, and forced to take refuge in the Thebaid, he authorized that prelate to resume the exercise of his functions. About the same time, the Christians of Egypt began to be denominated *Copts;* a name supposed by some to have been derived from that of an ancient king called *Kobt*, and by others to have originated from the Greek city of Coptos, whilst a third class contend that the Christians of Egypt were called Κοπτοι by the Greeks, in consequence of their adhering to the rite of circumcision, and a fourth, that the word *Copt* is only a corruption of the word ’Αιγυπτιος. (See the article Egypt, *sub initio.*)

But be this as it may, whilst it continued to be for the interest of the conquerors to pursue a conciliating line of policy towards the native population, or, in other words, to strengthen themselves by fomenting divisions and animosities in regard to disputed points in religion, the Egyptian language flourished, at least no obstacle was opposed to its cultivation. In a short time, however, the Copts as well as the Greeks began to be oppressed by their cruel and avaricious conquerors; the tyranny, which at first was only partial, became general; and the native population, being reduced to abject poverty, soon fell into a state of profound ignorance. Forced to learn the language of their masters, they neglected their ancient tongue, which daily became less useful; those of them who held the situations of *moubascher*, that is, of secretaries or intendants under the princes and grandees, had no other interest but to speak and write Arabic with purity; and thus the knowledge of Coptic began to decline, and was at length altogether lost in Egypt. But at what precise epoch the ancient language ceased to be spoken and understood, is a question which, considering the silence of the historical monuments, it is by no means easy to resolve. It appears, however, from a passage in the preface to the History of the Patriarchs of Alexandria by Severus, bishop of Ashmouneïn, that in the tenth century of our era the Coptic was no longer spoken in Egypt; but it is nevertheless certain that, long after this period, persons of consideration who desired to distinguish themselves by their acquirements studied Coptic, and that this language was as generally understood in Egypt as the Latin language is at present in Europe. There are still extant Coptic works composed long subsequently to the epoch fixed by Renaudot as that when the ancient language fell into total desuetude amongst the Egyptian Christians, namely, the century after the Mahommedan invasion; and, as Macrizy mentions the Coptic in several parts of his Description of Egypt, it would appear that, at the period when he wrote, that is, about the commencement of the fifteenth century, the language was not entirely lost. But for further details on this subject we must refer the reader to the learned and satisfactory work of M. Quatremère.

Having thus traced a rapid outline of the history of the Egyptian or Coptic under the Ptolemies, the Romans, and the Arabians, marking its different epochs, and indicating generally the changes it experienced, we shall now proceed to give a short account of the efforts which the learned of Europe have at different times made, sometimes with greater, sometimes with less success, to rescue that ancient idiom from oblivion, and, if we may so express ourselves, to impart to it a new existence.

Scaliger is commonly considered as the first who contemplated such an undertaking; but, if he really meditated the design which is attributed to him, it seems pretty certain that he was not in a condition to carry it into effect; for, as he makes a great parade of his acquaintance with Arabic, it may be presumed that he would not have been silent on the subject of Egyptian, if he had really known any thing of that language; and it is not a little remarkable, that in announcing his project of publishing a polyglot psalter in six languages, which he enumerates, he says not a word of Egyptian, nor is that language included in the number. Leonard Abela, who died at Rome in 1605, having been created bishop of Sidon, and sent to the East as apostolic nuncio by Gregory XIII., visited Syria, Mesopotamia, and Egypt, and during his travels made himself well acquainted with the oriental languages, including Egyptian; but whether he brought home any Coptic manuscripts, or imported only the knowledge he had acquired, has not been ascertained. John Baptist Remondi intended to publish the Bible in ten languages, namely, in Latin, Greek, Hebrew, Chaldaic, Arabic, Egyptian, Ethiopian, Armenian, Syriac, and Persian; and, besides the texts, and the different Latin versions, this collection was to contain grammars and lexicons of all these languages. But unfortunately his enterprise proved abortive, and the Egyptian remained completely unknown until the enlightened exertions of Peiresc procured for the learned of Europe the means of studying that language.

This illustrious man, to whom letters are under lasting obligations, spared neither pains nor expense to procure Coptic manuscripts. Of these he obtained several from Egypt, comprehending the gospels, epistles, and psalms, the Coptic ritual, and the liturgies of St Basil, St Gregory, and St Cyril; and he also expected the prophets in Coptic, as well as a psalter in seven languages, viz. Hebrew, Syriac, Greek, Coptic, Ethiopian, Persian, and Armenian, together with other curious manuscripts; but all of them were seized and carried off by pirates. Afflicted but not discouraged, Peiresc, having learned that the pirates had sailed for Tripoli, wrote to the pasha of that town, received a favourable answer, and not long afterwards was presented with a package wrapt up with great care, and said to have been transmitted from Tripoli. Peiresc, rejoiced at recovering the lost treasure, liberally rewarded the unknown persons by whom, as he supposed, it had been brought back to him. He was very disagreeably surprised, however, on opening the package, to find that it contained nothing but the Arabic dictionary of Raphelengius. But his zeal to promote the study of Coptic was in no degree cooled by the fraud thus practised on him; and having with a view to this engaged Samuel Petit and Salmasius to cultivate that new branch of literature, he communicated to them all the manuscripts which he had in his possession. Petit, however, appears to have made but little progress in this study; but Salmasius applied to it with great vigour, and had the merit not only of entering a new path without any guide, but also of inducing the learned to follow his example. In his different works may be seen the use which he made of the Coptic in explaining a number of Egyptian words; and his letter to Golius is particularly deserving of attention.

---

[1] "Il ne faut donc pas s'attendre à en trouver aucune trace dans les livres Egyptiens que nous possédons, qui appartiennent tous au genre ecclésiastique, et dont plusieurs, tels que les Actes des Martyrs, présentent une grande uniformité, tant pour le style que pour les faits." (Quatremère, *Recherches sur la Langue et la Littérature de l'Egypte*, p. 28.)

[2] The fragment of St Paul, published by Georgi and Münter, has been referred to this dialect, but, as M. Quatremère thinks, erroneously. (See *Recherches*, ubi supra; also Georgi, *Præfat. in fragment. Evangel. S. Johan.* p. 54, et seqq., and Münter *Commentatio de indole Versionis Sahidicæ Novi Testamenti*, p. 75, et seqq. Copenhagen, 1789.)

About this time Pietro della Valle returned from his travels in the East, bringing with him several Coptic manuscripts, and amongst others an extensive Copto-Arabic lexicon, accompanied with grammars. These he placed in the hands of Thomas Obicini, who had long resided in the Levant, for the purpose of being translated into Latin. The work was successfully commenced; and the congregation of the Propaganda had already caused to be cut the Coptic characters, which served to print the *Alphabetum Coptum seu Ægyptiacum*, a work which appeared in 1629. But the affairs of Obicini having fallen into confusion, the undertaking languished, and was at length totally interrupted by the death of the translator, amongst whose papers scarcely any thing was found relative to the work. Peiresc, however, having heard of the manuscript, and being extremely desirous for its publication, pressed Pietro della Valle to lend it him for the purpose of having it translated by Salmasius. The Italian, it seems, refused, but consented to communicate it to Kircher, who was then at Rome, and had acquired a great reputation; or, at all events, he preferred that the translation should be executed under his own eye. Salmasius was in despair on finding that the credit of such a work was to be reaped by another; and in a letter on the subject which he addressed to Peiresc he evinces a bitter feeling of disappointment.

Kircher, with the assistance of the manuscripts of Pietro della Valle, and those of the library of the Vatican, published, first, his *Prodromus Ægyptiacus*, Rome, 1636, and then his *Lingua Ægyptiaca Restituta*, Rome, 1644. The first of these works contains several preliminary dissertations, some of them perfectly foreign to its object, with an essay on Coptic grammar; the second, which, with all its errors, is an useful and meritorious work, contains a grammar and a Copto-Arabic vocabulary. The numerous faults committed by Kircher would deserve indulgence, and due allowance would be made for the difficulties incident to the task undertaken by him, were it not for his unpardonable arrogance, and the bad faith with which he has inserted in his work words which are not to be found in the original; as, for instance, MENDJÊS *hircus*, which Jablonski suspected to be supposititious, and which Quatremère was unable to discover in the manuscript of Pietro della Valle. Hence, the enthusiasm which Kircher's work at first excited soon cooled, and the author incurred severe censure for his extravagance and dishonesty. Bochart and Ludolf refuted his assertion that the Greek is derived from the Egyptian; Wagenseil analysed his explanation of an inscription engraved on Mount Sinai, and proved its falsehood; Picques alleged that, besides his mother tongue, Kircher knew only a little Latin, and almost no Greek; and Renaudot, who has entered into extensive details respecting the works of the Jesuit, pronounces upon them a severe judgment, which is confirmed by Wilkins, Blumberg, Lacroze, Jablonski, Barthélemy, Tromler, and Schmidt. So great, indeed, was the distrust excited by the exposure of his malpractices, that, at one time, his *Lingua Ægyptiaca Restituta* was believed to be a literary fraud; but this opinion is entirely inadmissible, now that the original manuscript has been recovered.[1] Kircher also translated into Latin an Egyptian manuscript containing the ceremonies used amongst the Copts in ordinations.

Amongst the manuscripts of Samuel Petit, deposited in the King's Library at Paris, M. Quatremère found a Coptic alphabet, with observations written in Latin, and also two French letters addressed to Petit from Tours, the author of which appears to have been profoundly conversant with the oriental languages. It is now known that these letters are the production of Gilles de Loche, a capuchin, who, according to Gassendi, returned from his travels in Egypt about the year 1633. Gessner, in his *Mithridates*, collected the Egyptian words which the ancients have transmitted to us; Bochart published a greater number; and Ménage, in illustrating the three dialects, collected and explained all the foreign words, Egyptian, Lybian, Persian, Macedonian, and others contained in the Greek and Latin authors. Tromler mentions a confession of faith in Latin and Coptic, printed at Rome in the year 1668; and Lelong indicates a dissertation of Erasmus Vinding, *De Linguæ Græcæ Ægyptiacæ Affinitate*, Copenhagen, 1660. Hottinger, in his *Bibliotheca Orientalis*, has given some details respecting the Egyptian language. Theodore Petræus, who had resided long in Egypt, studied Coptic, collected manuscripts in that language, and on his return published the first psalm in Coptic, with an Arabic translation and a Latin version. He also translated into Latin, from the Coptic text, the epistle of St Paul to the Ephesians. Huntington, during his stay in Syria and Egypt, employed himself in collecting oriental manuscripts, particularly in Coptic, and his rich collection was afterwards deposited in the Bodleian Library at Oxford. Marshal, celebrated for his labours on the Anglo-Saxon, was also profoundly acquainted with the oriental languages, and particularly with Coptic. Not satisfied with having collated the Coptic version of the gospels with the Greek text, and collected the various readings, he undertook to publish the New Testament in the same language; but after every thing had been prepared, this useful enterprise failed in consequence of the premature death of the editor, who only lived to print a single sheet, containing the first three chapters of St Mathew's gospel, accompanied with a Latin version, and notes.

---

[1] "Il est certain que Kircher, qui se piquoit de déchiffrer avec succès les hiéroglyphes et les caractères les plus inconnus, donna souvent prise sur lui à ses ennemis, et s'exposa à des méprises ridicules, en expliquant comme Egyptiennes et insérant dans ses ouvrages des inscriptions *tracées à plaisir*. On peut voir dans M. Tromler la manière dont il fut pris pour dupe par André Muller, gouverneur de Berlin, qui lui présenta des caractères factices, qu'il n'hésita pas à déclarer Egyptiens: Leibnitz parle d'une inscription envoyée de Vienne, que Kircher jugea composée ne mots Arabes, Syriaques, etc., tandis que Luc Holstenius n'y vit, avec raison, que des caractères Grecs un peu défigurés. (Quatremère, *Recherches*, pp. 54, 55.)

The study of Coptic was much encouraged at Oxford by the liberal patronage of the bishop, Dr Fell, who had caused Coptic types to be cast at his own expense for the intended work of Marshal, and who afterwards assisted Thomas Edward in his researches. Edward Bernard, having studied Coptic, left in manuscript an Egyptian lexicon, in which he explains many points concerning Egyptian antiquities. In 1686, Witsen, burgomaster of Amsterdam, presented to the university of Oxford the Ethiopian and Coptic punches, which he had sent to Edward Bernard. Bonjour, an Augustin friar of Toulouse, published *Exercitatio in Monumenta Coptica seu Ægyptiaca Bibliothecæ Vaticanæ*, Rome, 1699, in 4to; a work which is highly commended by Lacroze, and which displays a profound acquaintance with the Coptic language. This learned friar died in China in 1714, leaving several manuscript works, the most important of which is a History of the Dynasties of Egypt, cited by Cuper and by Georgi. Coptic literature owes much to Pope Clement XI., who, in the early part of the eighteenth century, sent three missions to Egypt in quest of manuscripts, and enriched the library of the Vatican with that beautiful and precious collection, which the treaty of Tolentino transferred to Paris, but which was afterwards restored on the downfall of Napoleon. Nor were the learned of Germany neglectful of the study of Coptic. Pfeiffer applied himself to the cultivation of that language, in which he wrote some indifferent verses. Andrew Muller studied Coptic, and applied it to the explanation of some words in the Bible. Acoluthus, a minister of the gospel at Breslau in Silesia, also devoted himself to this pursuit, and published a work entitled *Lingua Ægyptiaca Restituta*, in which he pretended that the ancient Egyptian had nothing in common with the Coptic, but might be detected in the modern Armenian. Acoluthus was a man of learning; but with all his erudition he was unable to give any colour of probability to this chimerical hypothesis. In the year 1716, Blumberg published a short Coptic grammar entitled *Fundamenta Linguæ Copticæ*, of which Lacroze has pronounced a very favourable opinion. Blumberg also promised a Copto-Latin and Latino-Coptic dictionary; but domestic misfortunes and a premature death prevented him from carrying his design into execution.

In France, Coptic literature was enriched by a great number of Coptic manuscripts brought from Egypt by Vansleb, and deposited in the library of the king. Louis Picques, doctor of the Sorbonne, who had distinguished himself as an orientalist, also applied with ardour to the study of Coptic, and was the first who recognised the variety of dialects. Besides the various readings of the Coptic and Armenian versions of the New Testament, we are indebted to him for ingenious etymologies of some Egyptian words, and amongst others of the famous name of Joseph, which has exercised the sagacity of several modern writers. This name, which the seventy-two write *Ψονθομφανηχ*, is, according to Picques, composed of the Coptic words ΠΣΟΤ-ΜΕΦΕΝΗ, *salus mundi*, the "safety of the world;"[1] which appears to be the only true etymology. He also made a great number of corrections on the lexicon of Kircher, and, in the few works which he published, displayed an erudition which justifies the commendations bestowed on them by his contemporaries. But all the orientalists who had yet appeared were eclipsed by the Abbé Renaudot, whose name will ever be dear to the lovers of eastern literature. In 1716, he published his Collection of the Oriental Liturgies, three of which (those of St Basil, St Gregory, and St Cyril) were translated from the Coptic; but the want of the characters prevented him from printing the original texts. To this translation are subjoined commentaries full of erudition, and several dissertations, particularly one entitled *De Copticarum Alexandrinorum Liturgiis*, and another, *De Lingua Coptica*. Scarcely had this work appeared, when it was attacked with the greatest asperity by Lacroze, under the pretext of avenging the memory of Ludolf, who had been severely handled both in the History of the Patriarchs of Alexandria, and also in the Collection of Liturgies. Lacroze was no doubt a formidable adversary, and he certainly detected some faults in the Collection of the learned Abbé, such as *Bibite vos omnes omnes* for *Bibite omnes*, which he denounces as an important falsification. But these errors were not of sufficient magnitude to justify the fierce ebullition of literary wrath displayed by Lacroze upon this occasion; and it is not a little amusing to find that, whilst exaggerating the oversights of his opponent, he is himself betrayed into some very serious inaccuracies. "En effet," says M. Quatremère, "si l'Abbé Renaudot n'avoit pas dans le Copte des connoissances très étendues, il est certain qu'il possédoit parfaitement l'Arabe et le Syriaque." This Lacroze is himself forced to admit.

As yet, however, the progress of the Egyptian language had been but slow and imperfect. All the Coptic monuments were still in manuscript, and the learned had no guide except the lexicon of Kircher, which, besides the errors with which it teems, and the omission of a great number of words, has the serious inconvenience of not being arranged in alphabetical order. But these obstacles were now about to be removed; and the first who contributed to facilitate the acquisition of Coptic was David Wilkius, a Prussian by birth, who, during his residence in England, changed his name into that of *Wilkins*, by which alone he is known. Wilkins applied with ardour to the study of Coptic, and after having examined every work connected with that language in the Bodleian Library, he travelled through France and Italy, occupying himself in copying or collating all the manuscripts he could find. In 1715, he published, in Chamberlayne's collection, the Lord's Prayer in Coptic, with a grammatical analysis, and a dissertation *De Lingua Coptica*. In 1716, he published, at the expense of the university of Oxford, the New Testament in Coptic, accompanied with a Latin translation. Lacroze, who examined this work with great care, discovered a multitude of errors both in the text and in the translation, and thence conceived a most unfavourable opinion of the talents of Wilkins, whom he taxes with gross ignorance of Coptic, and even places in this respect below Kircher. But this censure must appear somewhat too severe, when we reflect on the difficulties Wilkins had to surmount in the study of a dead language, which he had learned without a guide, and without having either a grammar or a dictionary to assist him. He redeemed his character, however, by his Coptic Pentateuch, which appeared in 1731, and in which, according to Jablonski, he greatly surpassed any thing he had previously done. Wilkins also proposed to publish a Coptic grammar and dictionary; but finding no encouragement, the enterprise was at length abandoned. The manuscript of his History of the Church of Alexandria was unfortunately lost immediately after his death, and all the exertions of Woide to recover it proved fruitless.

Lacroze, who about the same time occupied himself with the study of Coptic, left far behind him all those who had entered on the same career. He communicated his acquisitions on this subject to the celebrated Paul-Ernest Jablonski, so well known by his great erudition, and his labours connected with Egyptian antiquities; and Jablonski having, during his travels, copied, in whole or in part, several Coptic manuscripts, at Paris, at Leyden, and at Oxford, communicated these copies to Lacroze, who, with their assistance, and that furnished by the manuscripts of the library of Berlin, composed a very exact dictionary of the Coptic language. This work was that of all his manuscripts upon which the author set the greatest value; but not having the means of publishing it, he contented himself with printing the preface, which appeared in the *Bibliotheca Historico-Philologica Bremensis* (tom. v. p. 744). To his dictionary Lacroze annexed a list of words in the Sahidic dialect, in regard to which Picques and Renaudot had but confused notions, whilst all the other men learned in Coptic, including Wilkins, were absolutely ignorant of its' existence. The reputation of Lacroze's lexicon having spread throughout Europe, Wilkins, who had also composed a Coptic dictionary, proposed to Lacroze to cast both works into one, and to print it under their joint names, either at London or at Berlin; but the latter, who knew the merit of his own work, and felt no desire whatever to amalgamate it with that of Wilkins, declined the proposal. After the death of Lacroze, his Coptic dictionary passed with his other manuscripts into the hands of Jordan, his biographer; and, when the latter died, his brother sold the Coptic and Armenian dictionaries to the university of Leyden. In the Royal Library at Paris there is a copy of the Coptic dictionary in the handwriting of Lacroze.

---

[1] The Egyptian name of Joseph, expressed in Hebrew characters, is *Zaphnathpaneah*, which, as we have seen above, is written *Psonthomphanêch* in the Septuagint version; but there can be little doubt, we think, that both were formed from the Egyptian words *Psot-mepheneh*, as Picques has most ingeniously supposed.

Jablonski, in his *Pantheon Mythicum*, and in his dissertations on the god Rempha, the land of Goshen, Memnon, and other kindred subjects, made frequent use and showed a profound knowledge of Coptic. He had also laboured for many years on an Egyptian glossary, in which he collected, arranged in alphabetical order, and, with the assistance of the Coptic, explained, all the Egyptian words which are found dispersed in the Greek and Latin authors, and even in the Hebrew text of the Bible. He had also written a multitude of notes and corrections on the New Testament and Coptic Pentateuch of Wilkins. At his death these annotations, as well as the copies he had made of Memphitic and Sahidic manuscripts, were sold by his son to Dr Radcliff of Oxford; whilst another part of his papers, containing the glossary already mentioned, with a number of dissertations, discourses, and other productions, some of them still inedited, were sent to Leyden to the learned Ruhnkenius. Sensible of the value of these papers, Ruhnkenius placed them in the hands of Henry Albert Schultens, who readily undertook to arrange them for publication; Schultens, however, died soon afterwards; and, at the solicitation of Ruhnkenius, Tewater, professor of theology in the university of Leyden, consented to take charge of the publication, which accordingly appeared at Leyden in 1804, under the title of *Jablonskii Opuscula.* The Egyptian glossary forms the first volume of this collection, and, from the great erudition displayed in it, is calculated to add new lustre to the reputation of its celebrated author.

Amongst those who cultivated some acquaintance with Coptic may be mentioned Bayer, who studied it in the works of Lacroze; Richard Cumberland, bishop of Peterborough, who, having received a copy of Wilkins' Coptic New Testament, commenced the study of the language in his eighty-fourth year; George Whiston, who copied and translated into Latin the Pentateuch, and also composed a Coptic lexicon; Wasse and Gagnier, the latter of whom copied for Lacroze the Acts of the Apostles in the Sahidic dialect, from a manuscript in the Bodleian Library; Henselius, who gave some details on the Coptic in his *Synopsis Universæ Philologiæ, et Harmonia Linguarum totius Orbis*, Nuremberg, 1741; the Abbé Barthélemy, who, in his *Réflexions Générales sur les Rapports des Langues Egyptienne, Phénicienne, et Greque*, inserted in the Memoirs of the Academy of Belles-Lettres, evinced a considerable acquaintance with Coptic; Kocher of Berne, the author of a very learned dissertation *De Etymo nominum Cnuphis, aliorumque adfinium, ex Ægypto repetundo*, praised by Jablonski and Reiske; and Schmidt of the same place, who devoted himself exclusively to Egyptian studies, made frequent use of the Coptic to explain Egyptian words, particularly in his able dissertation *Sur une Colonie Egyptienne établie aux Indes*, and even composed a Coptic dictionary. Raphael Tuki, who was a Copt by birth, and bishop of Arsinoë, printed at Rome the liturgic works of his nation, in Coptic and in Arabic. He published the missal in 1736, the psalter in 1744, the diurnal in 1750, the first part of the pontifical in 1761, the second in 1762, the ritual in 1763, and, lastly, the office of the Virgin in 1764. Tuki also composed a Coptic grammar, which was published at Rome in 1778, by the congregation of the Propaganda, but which, like all the works of the orientals on the subject of grammar, is defective in method, and devoid of critical accuracy. Assemanni also published at Rome various liturgic pieces in Coptic and Arabic, with a Latin version. Lastly, Christopher Muller, in a work entitled *Satura Observationum Philologicarum*, Leyden, 1752, made some use of the Coptic, which he had learned with the help of Lacroze's dictionary, communicated to him by Dithmar Hakman, minister at Wassenaer.

Scholtz, preacher to the king of Prussia at Berlin, occupied himself with ardour in the study of Coptic. In 1748, he obtained permission from the university of Leyden to take a copy of Lacroze's lexicon; and this was accordingly done by Woide, a Pole, then a student in that university, who also took a copy of the dictionary for himself. Before this, Scholtz, being brother-in-law to Jablonski, had been assisted in his Coptic studies by that celebrated scholar, who communicated to him copies of his manuscripts; and having also at his disposal all the treasures of the library of Berlin, with the inedited remarks of Lacroze, he had composed a grammar of the Memphitic and Sahidic dialects, and a dissertation on the Coptic language. Afterwards, becoming possessor of the lexicon of Lacroze, and conceiving that the size of the work would be an obstacle to its publication, he made an abridgment of it, in which he carefully preserved all the words and significations, contenting himself with retrenching only the passages which in the original had been cited at length. This work had been completed, when, in 1765, Woide, passing through Berlin on his way to England, was intrusted by Scholtz with the abridgment of the dictionary, the grammar, and the dissertation, in order that he might endeavour to get them published. Woide, on his arrival in this country, applied to Dr Durell, vice-chancellor of Oxford, and, after a negotiation of more than two years, it was at length decided that the lexicon, grammar, and dissertation should be published at the expense of the university of Oxford. It was judged proper to print the dictionary first, as being the most important work. Woide, however, being dissatisfied with the abridgment of Scholtz, would have preferred publishing the lexicon as Lacroze had left it, with the passages cited at length; but although it would have been easy to verify the citations from the New Testament and the Pentateuch by the printed copies, it became almost impossible to refer to the passages from the psalms, liturgies, and other inedited works, of which there existed at most only two or three copies, in each of which the pagination was different. On the other hand, Lacroze, in composing his dictionary, had possessed but few aids; the works which he put under contribution being the New Testament, the psalms, the liturgies of St Basil, St Gregory, and St Cyril, and some extracts from the Pentateuch, Daniel, and the office of passion week. Sensible of the imperfection of this work, Woide, having collected a great number of additions from the Pentateuch, a volume of Coptic prayers, and other sources, solicited and obtained permission to insert these additions in the text of the dictionary. But the impression being already considerably advanced, and Scholtz, who wished the dictionary to be as short as possible, having desired the additions to be made at the end, Woide, after printing a small number in the body of the dictionary, where they appear in parentheses, resolved to publish a supplement in a separate form; and, in fact, he composed a very extensive Sahidic dictionary, though he was prevented by circumstances from completing his whole design.

The dictionary of Lacroze appeared in the year 1775, and the printing of the grammar was next commenced. But as this work, from its great length and want of method, seemed rather calculated to repel than to encourage students, it was resolved to print only an extract, and to deposit the original in the Bodleian Library. Scholtz consented to this arrangement, and Woide undertook to execute an abridgment of the work, which appeared in 1778. Woide performed his task with equal judgment and ability; he changed the plan adopted by Scholtz, who had separated the elements of the Sahidic dialect from those of the Memphitic; he recast both grammars into one, contenting himself with indicating, after each rule of the Memphitic dialect, the relations or the differences presented by the Sahidic; he expunged whatever seemed superfluous or useless, and inserted new observations, the fruit of a profound study of the language, with a multitude of passages and examples drawn from the Memphitic and Sahidic manuscripts which he had copied. His next undertaking was to collect and to publish all the fragments extant of the Sahidic version of the New Testament; and the impression was already far advanced, when death put a period to his laborious and useful career. But the work was continued by Ford, professor of Arabic at Oxford, and appeared in 1799, in one volume folio. Woide left numerous copies of Coptic and Sahidic manuscripts, a dissertation in English on the Coptic language, and the supplement to the lexicon of Lacroze.

With the aid of this dictionary, which Woide had lent him, J. Reinhold Foster applied to the study of Coptic, in which he made great proficiency, as appears by his letters to Michaelis, and by his work *De Bysso Antiquorum*. In 1767, Tromler published at Leipsig a small volume entitled *Bibliothecæ Copto-Jacobiticæ Specimen*, containing an enumeration of the works which had appeared on the language, history, and religion of the Copts, and preceded by a dissertation *de Fatis Linguæ Copticæ*. At Rome, the celebrated Cardinal Borgia, distinguished as a zealous and munificent patron of letters, engaged Georgi, who, in his *Alphabetum Tibetanum*, had evinced an intimate acquaintance with Coptic, to publish an ancient Sahidic fragment in his cabinet containing part of the Acts of St Coluthus. This work appeared at Rome in 1781, with a translation and notes by Georgi, and accompanied with a curious preface, in which the learned cardinal himself relates all that is known of the history and worship of St Coluthus. Georgi then occupied himself in translating and commenting on a very ancient fragment in the same cabinet, containing the Greek text and the Sahidic version of a portion of St John. This work appeared in 1789. In 1793, he published a second edition of the Acts of St Coluthus, with new additions, numerous notes, and a variety of Sahidic fragments from the cabinet of Cardinal Borgia. In the preface he has inserted extracts from several acts of martyrs, written in the Memphitic dialect, which the cardinal had caused to be copied by Tuki, from a manuscript in the Vatican Library; but the careless Copt had done his work very negligently, for the copy made by him is full of errors.

Whilst the works of Georgi thus contributed to advance the study of Coptic in the south, several learned men of the north of Europe directed their attention to that language. Adler, already distinguished by his acquirements as an orientalist, having learned Coptic during his residence at Rome, proceeded to examine the Sahidic manuscripts of Cardinal Borgia, after which he copied the book of Job and the fragments of the New Testament; he also employed the Coptic language to explain several Egyptian words. Münter, whom Cardinal Borgia had induced to study Coptic, caused to be printed at Rome, in 1786, the ninth chapter of Daniel, in the two dialects, with a translation and notes. On his return to Copenhagen he also published an excellent dissertation on the Sahidic version of the New Testament, to which he subjoined fragments of the epistles of St Paul to Timothy. Münter afterwards undertook, in conjunction with Adler, to publish the prophecy of Daniel in the Memphitic dialect, the book of Job, the greater part of the book of Proverbs, and fragments of the New Testament, in the Sahidic dialect.

Mingarelli, who at an advanced age studied Coptic, published at Bologna in 1785, several Sahidic fragments from the collection of the Chevalier Nani at Venice, with a Latin translation and notes. Zoega, of whom we have already spoken, made frequent use of the Coptic in his learned works on Egyptian coins, and also in that on the origin and use of the obelisks. It was he whom Cardinal Borgia selected to prepare a detailed catalogue of the Coptic and Sahidic manuscripts of his collection. Father Simeon a Magistris, in his edition of Daniel according to the Septuagint, and Bernard de Rossi in his dissertation *Della Lingua propria di Cristo*, have given some details respecting the Coptic language. In the year 1785, Thomas Valperga, abbot of Caluso, published at Parma a grammar of the Coptic language, under the assumed name of Didymus of Turin. Baron Silvestre de Sacy, one of the most learned orientalists of modern times, has made use of the Coptic language for explaining several Egyptian words, in his Observations on the name of the Pyramids, and also in his Letter on the triple inscription of Rosetta. Mr Akerblad, a learned Swede, applied with indefatigable ardour to the study of Coptic during his residence at Paris and at Rome; and his Letter on the inscription of Rosetta, in which he displayed equal erudition and sagacity, entitled him to rank amongst the small number of those who have thoroughly understood Coptic. In this class a distinguished place must be allotted to the accomplished author of the *Recherches sur la Langue et la Littérature de l'Egypte;* a work which is not more remarkable for profound research and extensive erudition, than for sound criticism and the happy union of conciseness and perspicuity. Nor is the celebrated author of *Asia Polyglotta* inferior to any of his predecessors or contemporaries in the knowledge of Coptic. This he has made sufficiently evident by his Letters on Acrological Hieroglyphics, and still more by his *Examen Critique des Travaux de feu M. Champollion sur les Hieroglyphes*, Paris, 1832, a work of disproportionate severity, but of great learning and extreme critical acuteness.

Without a knowledge of Coptic it is next to impossible to make any advance worth mentioning in the study of hieroglyphics. This is too obvious to require almost any illustration. If the Coptic be essentially identical with the ancient Egyptian, that is, if the remains of the latter be incorporated in the different dialects of the former, it is evident that the phonetic alphabet can never be applied to any good purpose except by those who are in a condition to distinguish and to understand something of the language in which the inscriptions are written. A person ignorant of Coptic may indeed decipher, by means of this alphabet, the

Rosetta Inscription.

foreign proper names contained in the ovals or rings; but beyond this he cannot advance a single step; to him a legend or a text must be as inaccessible as if nothing had been done on the subject of hieroglyphics since the days of Pierius and of Kircher. Accordingly, all those who have recently treated of the subject evince, by their writings, that they have been at pains to acquire in a greater or less degree this indispensable preliminary qualification. See, in particular, Rosellini, *I Monumenti dell' Egitto e della Nubia*, Pisa, 1832, 1833, 1834; and Wilkinson, *Materia Hieroglyphica*, Malta, 1828; also *Topography of Thebes, and General View of Egypt*, London, 1835.[1]

III. DR YOUNG'S ANALYSIS OF THE TRIPLE INSCRIPTION OF ROSETTA.

The block or pillar of black basalt, found by the French in digging up some ground at Rosetta, and now placed in the British Museum, exhibits the remains of three distinct inscriptions; and the last, which is in Greek, ends with the information, that the decree which it contains was ordered to be engraved in three different characters, the sacred letters, the letters of the country, and the Greek. Unfortunately a considerable part of the first inscription is wanting; the beginning of the second, and the end of the third, are also mutilated; we have, therefore, no precise points of coincidence from which we can set out, in our attempts to decipher the unknown characters. The second inscription, which it will be safest to distinguish by the Greek name *enchorial*, signifying merely the characters *of the country*, notwithstanding its deficiencies near the beginning, is still sufficiently perfect to allow us to compare its different parts with each other, and with the Greek, by the same method which we should employ if it were entire. Thus, if we examine the parts corresponding, in their relative situation, to two passages of the Greek inscription in which the proper names *Alexander* and *Alexandria* occur, we soon recognise two well-marked groups of characters resembling each other, which we may therefore consider as representing these names; a remark which was first made by M. de Sacy, in his letter relating to this inscription. A small group of characters, occurring very often in almost every line, might be either some termination, or some very common particle; it must, therefore, be reserved till it be found in some decisive situation, after other words have been identified, and it will then be easily shown to mean *and*. The next remarkable collection of characters is repeated twenty-nine or thirty times in the enchorial inscription; and we find nothing which occurs so often in the Greek, except the word *king*, with its compounds, which is found about thirty-seven times. A fourth assemblage of characters is found fourteen times in the enchorial inscription, agreeing sufficiently well in frequency with the name of *Ptolemy*, which occurs eleven times in the Greek, and generally in passages corresponding to those of the enchorial text in their relative situation; and, by a similar comparison, the name of *Egypt* is identified, although it occurs much more frequently in the enchorial inscription than in the Greek, which often substitutes for it country only, or omits it entirely. Having thus obtained a sufficient number of common points of subdivision, we may next proceed to write the Greek text over the enchorial, in such a manner that the passages ascertained may all coincide as nearly as possible; and it is obvious that the intermediate parts of each inscription will then stand very near to the corresponding passages of the other.

In this process, it will be necessary to observe that the lines of the enchorial inscription are written from right to left, as, Herodotus tells us, was the custom of the Egyptians; the division of several words and phrases plainly indicating the direction in which they are to be read. It is well known that the distinct hieroglyphical inscriptions, engraved on different monuments, differ in the direction of the corresponding characters. They always face the right or the left of the spectator, according as the principal personages of the tablets to which they belong are looking in the one or the other direction; but where there are no tablets, they almost always look towards the right; and it is easily demonstrable that they must uniformly have been read beginning from the front and proceeding to the rear of each rank. But the Egyptians seem never to have written alternately backwards and forwards, as the most ancient Greeks occasionally did. In both cases, however, the whole of the characters thus employed were completely reversed in the two different modes of using them, as if they were seen in a glass, or printed off like the impression of a seal.

By pursuing the comparison of the inscriptions thus arranged, we ultimately discover the signification of the greater part of the individual enchorial words; and the result of the investigation leads us to observe some slight differences in the form and order of some parts of the different inscriptions, which are indicated in the conjectural translation published in the *Archæologia* and in the *Museum Criticum*. The degree of evidence in favour of the supposed signification of each assemblage of characters may be most conveniently appreciated, by arranging them in a lexicographical form, according to the words of the translation, the enchorial words themselves not readily admitting a similar arrangement; but the subject is not of sufficient interest for the public to make it necessary that this little lexicon should be engraved at length.

It might naturally have been expected that the final characters of the enchorial inscription, of which the sense is thus determined with tolerable certainty, although the corresponding part of the Greek is wanting, would have immediately led us to a knowledge of the concluding phrase of the distinct hieroglyphical characters, which remains unimpaired. But the agreement between the two conclusions is by no means precise; and the difficulty can only be removed by supposing the *king* to be expressly named in the one, whilst he is only designated by his titles in the other. With this slight variation, and with the knowledge of the singular accident, that the name of Ptolemy occurs three times in a passage of the enchorial inscription, where the Greek has it but twice, we pro-

---

[1] In the last-mentioned work, the author, Mr Wilkinson, gives us an important piece of information connected with the subject treated of in this section. After expressing his regret that the Delta has been so little examined, "especially as some light might possibly be thrown on the remains of a very interesting period," he proceeds thus: "Another object worthy of the attention of future travellers, is the ancient library of a Copt convent at the Natron Lakes, where, besides many other manuscripts, is *a Coptic and Arabic dictionary*, which, though it cannot be purchased, *might be copied*, on a proper application for that purpose to the patriarch of Qaherah (Cairo). And as the study of hieroglyphics, and our future insight into the long-lost language and early history of Egypt, depend entirely on the possession of a similar work, it would at the present moment be an inestimable acquisition." (*Topography of Thebes*, &c. p. 347.) From all that we have known or learned of oriental lexicographers or grammarians, we are not inclined to estimate so highly as Mr Wilkinson has here done, the advantages likely to result from the acquisition of this lexicon; but, at the same time, we entirely agree with him in thinking that "proper" means should immediately be employed to obtain a copy of the dictionary, more especially as it appears to be so highly prized by the Copts. Mr Wilkinson informs us that his own efforts to obtain permission to copy it proved fruitless. But if the viceroy were induced to signify his pleasure on the subject, the patriarch would most probably find it convenient not to withhold his assent.

Rosetta Inscription.

ceed to identify this name amongst the sacred characters, in a form sufficiently conspicuous to have been recognised upon the most superficial examination of the inscriptions, if this total disagreement of the frequency of occurrence had not imposed the condition of a long and laborious investigation, as an indispensable requisite for the solution of so much of the enigma. This step, however, being made good, we obtain from it a tolerably correct scale for the comparative extent of the sacred characters, of which it now appears that almost half of the lines are entirely wanting, whilst those that remain are also much mutilated. Such a scale may also be obtained, in a different manner, by marking, on a straight ruler, the places in which the most characteristic words, such as *god*, *king*, *priest*, and *shrine* occur, in the latter parts of the other inscriptions, at distances proportional to the actual distances from the end; and then trying to find corresponding characters amongst the hieroglyphics of the first inscription, by varying the obliquity of the ruler, so as to correspond to all possible lengths which that inscription can be supposed to have occupied, allowing always a certain latitude for the variations of the comparative lengths of the different phrases and expressions. By these steps it is not very difficult to assure ourselves, that a *shrine* and a *priest* are denoted by representations which must have been intended for pictures of objects denoted by them; and this appears to be the precise point of the investigation at which it becomes completely demonstrative, and promises a substantial foundation for further inferences. The other terms, *god* and *king*, are still more easily ascertained, from their situation near the name of Ptolemy.

The most material points of the three inscriptions having been thus identified, they may all be written side by side; and the sense of the respective characters may be still further investigated, by a minute comparison of the different parts with each other. The last line of the sacred characters, with the corresponding parts of the other inscriptions, which the reader will find represented under the head *Specimens of Phrases*, will serve as an illustration of the result which has been obtained from these operations.

In thus comparing the enchorial with the sacred characters, we find many coincidences in their forms, by far too accurate to be compatible with the supposition that the enchorial could be of a nature purely alphabetical. It is evident, for example, that the enchorial characters for a *diadem*, an *asp*, and *everliving*, are immediately borrowed from the sacred. But this coincidence cannot certainly be traced throughout the inscriptions; and it seemed natural to suppose, that alphabetical characters might be interspersed with hieroglyphics, in the same way that the astronomers and chemists of modern times have often employed arbitrary marks, as compendious expressions of the objects which were most frequently to be mentioned in their respective sciences. But no effort, however determined and persevering, had been able to discover any alphabet which could fairly be said to render the inscription, in general, at all like what was required to make its language intelligible Egyptian, although most of the proper names seemed to exhibit a tolerable agreement with the forms of letters indicated by Mr Akerblad; a coincidence, indeed, which might be found in the Chinese, or in any other character not alphabetical, if they employed words of the simplest sounds for writing compound proper names.

The question, however, respecting the nature of the enchorial character, appears to be satisfactorily decided by a comparison with each other, of various manuscripts or papyri still extant. Several of these, published in the *Description de l'Egypte*, have always been considered as specimens of the alphabetical writing of the Egyptians, and certainly have as little appearance of being imitations of visible objects, as any of the characters of this inscription, or as the old Arabic or Syriac characters, to which they bear, at first sight, a considerable resemblance. But they are generally accompanied by tablets, or delineations of certain scenes, consisting of a few visible objects, either detached, or placed in certain intelligible relations to each other; and we may generally discover traces of some of these objects amongst the characters of the text that accompanies them. A similar correspondence between the text and the tablets is still more readily observable in other manuscripts, written in distinct hieroglyphics, slightly yet not inelegantly traced, in a hand which appears to have been denoted by the term *hieratic;* and by comparing with each other such parts of the text of these manuscripts as stand under tablets of the same kind, we discover, upon a very minute examination, that every character of the distinct hieroglyphics has its corresponding trace in the running hand; sometimes a mere dash or line, but often perfectly distinguishable, as a coarse copy of the original delineation, and always alike when it answers to the same character. The particular passages which establish this identity extend to a series of above ten thousand characters; they have been copied in adjoining lines, and carefully collated with each other; and their number has been increased, by a comparison with some yet unpublished rolls of papyrus. A few specimens from different manuscripts, sufficient to show the forms through which the original representation has passed, in its degradation from the *sacred* character, through the *hieratic*, into the *epistolographic*, or common running hand of the country, will be found under the head of *Comparison of Manuscripts*.

It seems at first sight incomprehensible that this coincidence, or rather correspondence, should not be equally observable in the two inscriptions of the Rosetta stone, which, if the enchorial character is merely a degradation of the sacred, must naturally be supposed to be as much alike as those of the different manuscripts in question; whilst, in reality, we can but seldom trace any very striking analogy between them. But the enchorial character, having long been used in rapid writing, and for the ordinary purposes of life, appears to have become so indistinct in its forms, that it was often necessary to add to it some epithet or synonym, serving to mark the object more distinctly; just as, in speaking Chinese, when the words are translated from written characters into a more limited number of sounds, it is often necessary, on account of the imperfection of the oral language, to add a generic word, in order to determine the signification, and to read, for example, *a goose bird*, when *a goose* only is written, in order to distinguish it from some other idea implied by a similar sound; and just as in English we might sometimes be obliged to say *a yew tree*, in order to distinguish it from *a ewe sheep*, or *you yourself*, or *the letter u*. The enchorial character, therefore, though drawn from the same source, can scarcely, in this form, be called the same language with the sacred hieroglyphics, which had probably remained unaltered from the earliest ages, whilst the running hand admitted all the variations of the popular dialects, and bore but a faint resemblance to its original prototype. Indeed, if it had been completely identical, there could have been no propriety in repeating the inscription with so slight a change of form.

The rituals and hymns contained in the manuscripts which have been mentioned, are probably either of higher antiquity than the inscription of Rosetta, or had preserved a greater purity of character, as having been continually copied from older originals. It is also remarkable, that in one of these rolls of papyrus, engraved by Denon, the introduction is in the sacred character, and some of the

Vocabulary.

phrases contained in it may be observed to be repeated in the subsequent part of the manuscript, which is in a kind of running hand, though somewhat less degraded than in most other instances.

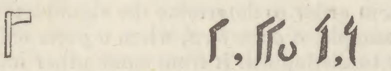
It was not unnatural to hope, that the comparison of these different manuscripts would have assisted us very materially in tracing back all the enchorial characters to the corresponding hieroglyphics, as far as the parts of the respective inscriptions remain entire, and even in filling up the deficiencies of the sacred characters where they are wanting; and something has certainly been gained from it with respect to the names of several of the deities; but, on account of the differences which had crept in between the forms of the language, expressed by the sacred and the cursive characters, the advantage has hitherto been extremely limited. It seems, indeed, to have been a condition inseparable from the whole of this investigation, that its steps should be intricate and laborious, beyond all that could have been imagined from our previous knowledge of the subject; and that, whilst a number of speculative reasoners have persuaded themselves, at different times, that they were able to read through a hieroglyphical inscription in the most satisfactory manner, beginning at either end, as it might happen, the only monument which has afforded us any real foundations for reasoning on the subject, is more calculated to repress than to encourage our hopes of ever becoming complete masters of the ancient literature of Egypt; although it is unquestionably capable of serving as a key to much important information with respect to its history and mythology. Nor is it by any means impossible, that a careful consideration of other monuments already known, or of such as are now discovered from day to day, may enable us to detect a number of unknown characters, so situated with respect to others which are already understood, as to carry with them their own interpretation, supported by a degree of evidence far exceeding mere conjecture.

IV. RUDIMENTS OF AN HIEROGLYPHICAL VOCABULARY.

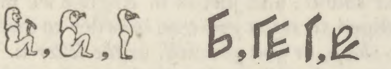
1. *Deities.*

1. The word God is always represented in the inscription of Rosetta, and often in many others, by a character resembling a particular kind of hatchet, which is delineated repeatedly at Medinet-Habou as a weapon in the hands of warriors, and is even found amongst the modern weapons engraved by Denon.[1]

GOD *powerful.*
ⲛⲟⲩϯ



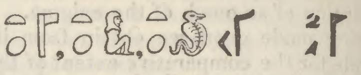
GOD *judge.*



This character is frequently exchanged, in parallel passages of different manuscripts, or of the same, for a figure sitting or standing without distinct arms or feet, either with a human head or a hawk's head; or sometimes, by a deviation from the correct nature of an abstract or general term, with the heads of different animals, according to the character of the deity to whom it is applied. But in the inscription of Rosetta this symbol appears to be exclusively appropriated to the gods in their *judicial* capacity; and it occurs several times in the term meaning *lawful,* which will be afterwards explained. This interpretation is also fully justified by the testimony of Plutarch, that "the figures of *judges* were represented without hands."

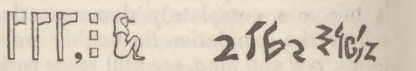
2. A Goddess is denoted by the hatchet or sitting figure, with the addition of the female characteristic, generally as a termination; but sometimes the simple character is applied to gods and goddesses indifferently.

GODDESS.
ϯⲛⲟⲩϯ



The semicircle and oblique oval, distinguishing the feminine gender, are observable in almost all well-marked names of females found in different tablets; and the crooked line, which corresponds to them, in the enchorial character of the stone of Rosetta, may be distinguished at the end of each of the five names of females that occur in the inscription. Occasionally the characteristic is prefixed, and this position agrees better with the Coptic ti, which distinguishes a female. Nor must we omit to observe, that a semicircle seems to answer to the t in some other cases, and is always expressed in the running hand by the character which Mr Akerblad calls t or d, and which is also exactly the Syriac t. The asp or basilisk standing erect is a symbol of divinity, which occurs on the green sarcophagus called the tomb of Alexander, and elsewhere, instead of the more ordinary character. In a few instances, the semicircle is found without the oblique oval. The plural, Gods,

GODS.
ϩⲁⲛⲛⲟⲩϯ



is formed by repeating the character three times, or by placing three dashes after, or sometimes before it. In the enchorial inscription, the dashes are united into a crooked line, and are placed in this instance both before and after the principal character; but, in general, the second line is straighter than the first. The dual is expressed by a double character only.

3. A winged globe, sometimes flattened as if intended for an egg, but often coloured red, is very commonly represented as hovering over a hero, and generally occupies the lintel of some of the doors of a temple.

Agathodaemon.
ⲓϥⲛⲟⲩϥⲓ ?

A globe nearly similar is also sometimes connected with the head and tail of a serpent, bearing the symbol of *life,* which is the common characteristic of a deity. There can, therefore, be no objection to considering these representations as belonging to the *Agathodaemon,* or *Chnuphis* of the Greek authors; and the same symbol is sometimes found in the text of an inscription, in the neighbourhood of the pictural representation. Its sense may therefore be considered as tolerably well ascertained; but the evidence being somewhat indirect, the name is inserted in smaller characters, the same distinction being also observed in other instances. Mr Bruce informs us, in his letter to Mr Wood, that in some parts of the Tunisian dominions, serpents are still regarded as a kind of good angels. The Chnubis, or Chnumis, of the amulets, is generally represented as a serpent with a human head, or with that of a lion; and the former combination is not uncommon in the tablets of the manuscripts; but the hieroglyphic denoting it is a long undulated line, totally distinct from this character.

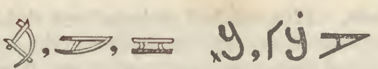
4. The symbol, often called the *Hieralpha,* or sacred a, corresponds, in the inscription of Rosetta, to Phthah, or Vulcan, one of the principal deities of the Egyptians.

---

[1] See plate xcv. of Denon's work. In the figures inserted in the text the representation is for the most part given in the sacred and in the enchorial characters of the Rosetta inscription.

Vocabulary.

PHTHAH.
ⲡⲧⲁϩ



A multitude of other sculptures sufficiently prove, that the object intended to be delineated was a plough or hoe; and we are informed by Eusebius, from Plato, that the Egyptian Vulcan was considered as the inventor of instruments of war and of husbandry. In many other inscriptions, the pedestal or pulley is used indifferently for the plough. Horus Apollo tells us, that Vulcan was denoted by a beetle; and the Monticœlion obelisk of Kircher has the plough on three sides and the beetle on the fourth. Horus Apollo, however, is seldom perfectly correct; and the names of different divinities are frequently exchanged on the banners of the same obelisk; nor is there any clear instance of such an exchange of the plough for the beetle as occurs perpetually in the case of the pedestal. The beetle is frequently used for the name of a deity whose head either bears a beetle, or is itself in the form of a beetle; and in other instances the beetle has clearly a reference to generation or reproduction, which is a sense attributed to this symbol by all antiquity; so that it may possibly sometimes have been used as a synonym for Phthah, as the father of the gods. The plough is very rarely found as the name of a personage actually represented; and it is difficult to say under what form the Egyptian Vulcan was chiefly worshipped; but on the tablet of a Horus of bad workmanship, belonging to the Borgian Museum, he is exhibited with a hawk's head, holding a spear; whilst in the great ritual of the *Déscription de l'Egypte* (Antiq. ii. pl. 72, col. 104), he seems to be represented by a figure with a human head; an exchange, however, which is very common in some other cases, with respect to these two personifications, though it does not extend to the substitution of the heads of different animals for each other.

5. Ammon, the Egyptian Jupiter, is sufficiently identified by a combination of evidence of various kinds, although no single link of the chain extends very far. A figure with a ram's head is denoted, both on the green sarcophagus and on the temple at Elephantiné, by a water jar, sometimes, but not always, accompanied by a bird.

AMMON.
ⲁⲙⲟⲩⲛ

Now, a water jar of this form is constantly converted, in the running hand of the manuscripts, into a character like a z; and this character, in the enchorial text of Rosetta, is made to express the name of Jupiter; a fact which confirms the testimony of the Greek authors, who considered the Egyptian Jupiter as having been represented with a ram's head. A similar figure is found at Edfou (*Apollinopolis Magna*), and at Esneh (*Latopolis*). The temple at Edfou seems to have been dedicated by Amenophis or Memnon; and he appears to be called "lover of Ammon," that is, Miamun,[1] which is not unlike the name Memnon.

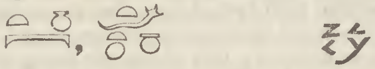
6. The common astronomical diagram for the sun, ⊙, seems to have been adopted by the Latin astrologers from their masters in Egypt; since it is not very probable that both should have employed a point in the centre of the circle, without some communication with each other, the circle alone having been mentioned by some of the Greek authors, who say that it was the symbol of the sun.

PHRE.
ⲫⲣⲏ

The deity Ra, Re, or Phre, is indicated by this character followed by an upright bar; and the circle is often enveloped in the coil of the body of a serpent, whilst an oval and an arm also frequently follow the circle. The enchorial name of the sun is extremely like that which corresponds in the manuscripts to this hieroglyphic. And a similar circle, with rays diverging from it, though seldom exactly in straight lines, is used in the sense of "enlightening," or "rendering illustrious;" and it has also been observed by some of the French, who have been in Egypt, to stand in several inscriptions with a manifest reference to light. The circle occurs also as a part of the terms month and day. In the great Hieratic Ritual, and in some other manuscripts, this name of Phré occurs very frequently under or near the tablet which contains a representation of the sun shining, as well as under the next to it, which exhibits a head rising out of a lotus, an emblem mentioned by Plutarch as relating to the sun, which here is made to spring from the pedestal, as the sun is said to have been the offspring of Phthah. Whatever plant that called the lotus may have been, it certainly does not much resemble the nelumbo of the East, which some imagine to have been the original emblem of fertility. The name Phré is almost the only intelligible combination of letters that ever occurs on the Abraxas[2] or amulets; and the monster to which it relates has generally radiations from its head, and is surrounded by six stars. The tablets of the sun in the manuscripts exhibit also little genii worshipping him, each of which is always marked "star god."

7. The name of Rhea may, without impropriety, be assigned to a female personage very commonly accompanying the sun, and distinguished by many of his attributes, thus:

RHEA.
ϯⲫⲉ ?



although the evidence would have been somewhat more conclusive if the name had been found attached to the figure of the mother in the tablet of the birth of Isis. On the coffins of the mummies, this personage is generally represented with outstretched wings, and in other tablets without wings; but she carries in both cases a circle on her head, emblematic of the sun. If we considered the analogy of the hieroglyphical name only, we should be disposed to interpret it as meaning the wife or sister of Ammon.

8. Ioh, the moon, is not a deity of very frequent occurrence; but the character is easily interpreted, both from its form, and from its being found in a different position, as a part of the word month.

---

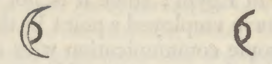
[1] Or rather Meiamun, which is more like Memnon, and may also mean "beloved of Ammon."

[2] The word *Abraxas* or *Abrasax*, which Michaelis supposes, with reason, to be older than the days of the Gnostics, and of pure Græco-Egyptian origin, may nevertheless be considered as the principal and ordinary name of the Basilidian sun-god; and its import shows that the whole superstition of the Gnostic or Basilidian school of heretics was founded upon the mysteries of the Egyptian calendar, *Abraxas* or *Abrasax* being composed of the six Greek letters which represent the number of days in the Egyptian year. Thus,

A	1
B	2
P	100
A	1
Σ	200
A	1
Ξ	60
	365

Abraxas being composed of the very same letters transposed, would of course give precisely the same result. (Vide *Auct.* apud Montfaucon, p. 355 et seqq.; Jablonski, *Dissert. de Nom. Abraxas*, § 9. 12. *Opusc.* tom. iv. p. 96 et seqq.)

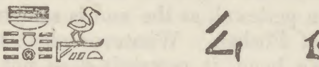
IOH.
ιοϩ



At Denderah this character is accompanied by the epithet God, and without any female termination, as well as in several passages of an epistolographic manuscript sent home by Mr Bankes; a circumstance which is favourable to the opinion that Ioh was considered as masculine in mythology as well as in grammar, just as *men* or *lunus* was sometimes made masculine by the Greeks and Romans. The fact, however, is not absolutely decisive of this question, since the character is not accompanied by the delineation of any personification of the deity.

9. The historical description of the god THOTH, or *Hermes*, as the scribe or secretary of Osiris, and the inventor of writing, sufficiently identifies him with the person who is perpetually represented standing before Osiris, and writing with a quill or a style on a square or oblong tablet. He has always the head of an ibis, and this bird, standing on a perch, constitutes his hieroglyphical name, as the ibis is known to have been the emblem of Thoth. The hieroglyphic for letters is also frequently found amongst his titles; and all these circumstances abundantly confirm the opinion of his true character, which Zoega and others had already advanced from conjecture only.

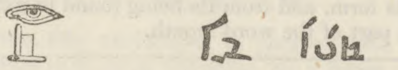
THOTH.
θωουτ



The enchorial name is very much disfigured, but the manuscripts exhibit a character which may serve to supply the connecting link, and another abridgment of the name which deviates still more widely from the original, being simply the common substitute for a feather, which here seems to stand for the whole bird, or perhaps merely for a feather which is often found projecting from the end of the perch. Next to Osiris, we find that Thoth is of more frequent occurrence than any other deity in the great ritual; and it is probable that the mummies of the ibis, which are so commonly found, were preserved in honour of him. The semicircle with two oblique dashes, under the perch, seems to correspond to the epithet "great and great" of the Rosetta inscription; this character being generally significative of a dual. The scale, with eight dashes, and two other characters, is also very frequently employed as an epithet, and sometimes as a synonym of Thoth; it seems to mean "Dispenser of the eight treasures, or laws, of the country," for Diodorus informs us that the principal laws of Egypt were contained in eight books.

10. The name of OSIRIS is found, with the epithet "divine," in a great majority of all the mythological inscriptions that have yet been discovered; so that this circumstance alone is sufficient to show that it must have been that of the principal deity of Egypt.

OSIRIS.
ουσιρι



The enchorial character of the inscription of Rosetta is readily identified, and it agrees perfectly well with that of the manuscripts, answering to the eye and the throne; so that the manuscripts here completely supply the want of that part of the stone which contained the name in the sacred characters. This name is also universally annexed to the great figure which is found at the end of almost all the manuscripts, and on the coffins of mummies, holding a hook and a whip or fan, and of which the small detached images are also extremely common. In the sculptured inscriptions, the eye generally precedes the throne; in the running hand of the manuscripts, and on the coffins of some mummies, apparently of later date, the eye sometimes follows. Plutarch had perhaps been rightly informed respecting this character; but by a mistake, which was easily committed from a want of perfect recollection, he has called it "an eye and a sceptre;" and this combination has not been recognised as the name of a deity, though a symbol something like it occurs in some of the tablets. The pictured delineation of Osiris has indifferently a human head or that of a hawk, but never that of any other animal. The tear seems also sometimes to have been used as an emblem of Osiris, as well as of Apis and Mneuis, who were considered as representations of him. The name is found perpetually on monuments of all kinds as an epithet of a departed person; and this is one great reason of the frequency of its occurrence.

ARUERIS.

11. This divinity, the Apollo of the Egyptian mythology, is sufficiently identified by the comparison of various inscriptions with the fragment of Hermapion, preserved by Ammianus Marcellinus, as the translation of the inscription on a particular obelisk, with which, however, it does not exactly agree, although its style completely resembles that of the Egyptian inscriptions in general, and the beginning corresponds perfectly well to the beginning of almost all the obelisks in existence, supposing only the hawk to be part of the name of Arueris; which is, besides, an inference extremely probable, from the tablets of several of the obelisks, representing a deity characterised by a hawk with two bars, and styled the son of another personage who seems to be the sun, as Apollo is called by Hermapion, and Arueris by Plutarch. Mr Hamilton has also given us a Greek inscription at Ombos, in which Arueris is made synonymous with Apollo; although the hieroglyphics which have been copied from this temple afford us no assistance in the inquiry. The sort of ladder, which occurs as a second name of Arueris, is found prefixed to the hawk in its usual form, on the obelisk at Wanstead figured by Gordon, and on the frize of Montagu and Ficoroni (*Hieroglyphics of the Egyptian Society*, 7 Eo p; 9 Lk); and the same figure follows it on a statue of Pococke (vol. i. p. 212). Arueris is commonly represented either with a human head, or with that of a hawk, bearing a disc, as that of the sun is also generally depicted; and in one of Denon's plates, the two deities seem in some measure confounded. The Egyptian name may be interpreted "evening sun," as emblematic of the repose of victory; ER RUHI RE.

12. ISIS, the sister and wife of Osiris, is very naturally denoted by the throne with the female termination, thus:

ISIS.
ησι, θεσι ?

and in more than one instance, the female figures, which have long been recognised as representations of Isis by other attributes, are distinguished by bearing the throne on the head, which is a common mode of characterising the different personages of the tablets. The manuscripts, again, enable us to discover the connecting link between the sacred and enchorial characters, and to supply the defects of the monument of Rosetta; though the resemblance is somewhat too imperfect to have satisfied us without their assistance. The goddess, thus distinguished, is very generally represented as standing at the head or feet of a corpse, with another female figure opposite to her; and we find the same personages at the opposite ends of several of the sarcophagi; so that the analogy of Isis to Proserpine, and her character as the guardian of the remains of the dead, are sufficiently consistent with these representations. On a scaraboeus brought from Egypt by Mr Legh, and in a hieroglyphical inscription at Philae, she appears to be called the offspring of Phthah. Isis often bears in her hand a sceptre forked at the foot, with a lotus for its head, whilst Osiris has more commonly a similar sceptre with the head of an animal; but these attributes are sometimes assigned to other deities. In one of the boats on the green sarcophagus, and on Letheuillier's mummy, both in the British Museum, she is personified as a basilisk. Mr Hamilton has published some Greek inscriptions from Philae, and from the small temple at Denderah, which show that Isis was the principal deity of these temples; and the hieroglyphics, as far as they have been copied, are precisely of the same import. The great temple at Karnak seems also to have been dedicated to Isis, and probably the small southern temple. On a medal, of Greek workmanship, in the Borgian Museum, we have a figure of Isis, with the word THESI, which may probably have been intended for TIESI, the Egyptian name with the feminine article.

13. The constant companion of Isis can be no other than NEPHTHE.

NEPHTHE.

Her name somewhat resembles that of Isis, with a scale or basin annexed to it; but the square surrounding the throne is completed, while the scale is sometimes detached from it, with a circle interposed; and, in this form, the name comprehends one of the characters denoting a temple. It seems also to be a head of Nephthe that is found at Denderah and elsewhere, supporting a little temple or shrine, in the place of the capital of a column; nor is it improbable that the temple at Denderah was dedicated to Nephthe; for the Greek inscription has Aphrodite, which is mentioned by Plutarch as a synonym of Nephthe. It is true that the birth of Isis is represented on one of the ceilings; but it does not therefore follow that Isis was the principal goddess of the temple. A head bearing a shrine is not an uncommon ornament of a *sistrum;* and this agrees perfectly with the remark of Plutarch, that the head of Nephthe, as well as that of Isis, was sometimes represented on these instruments.

BUTO.

14. The emblem of a bird in a cage, which is often found in the manuscripts accompanied by the figure of a child, seems to indicate the character of a *nurse,* and may without inconvenience be interpreted as relating to the goddess BUTO, the nurse of Horus and Bubastis; though it would perhaps have been more correct to engrave the name in smaller letters, as denoting some degree of uncertainty. On the sarcophagus called the Lover's Fountain, in the British Museum, she is delineated with a hawk's head; and in the western temple at Philae she has a human head with a horned head-dress, and she sits near Isis and Horus; a circumstance which strongly confirms the propriety of the denomination.

15. The enchorial name of HORUS seems to be derived from the figure of a hawk followed by the character denoting Isis; an arrangement which agrees very well with the supposition that his usual denomination was HÔRSIÊSI.

HORUS.
ϩⲱⲣⲥⲓⲏⲥⲓ?

The figure of the infant, the chain, and the knot, clearly form a part of the name on a Horus engraved by Montfaucon (*Antiq. Expliq.* tom. ii. p. 302), and on an obelisk from Bosc in the Supplement of the same work. In some cases a feather, following the infant, seems to supply the place of the bird, as in Caylus (*Récueil,* tom. iv. pl. 13).

PAAMYLES.

16. PAAMYLES, mentioned by several authors as the Priapus of Egypt, is sufficiently distinguishable by his usual attributes. He is often figured with one hand only, which is elevated towards the angle of a kind of whip or fan suspended above him. At Edfou he is once denoted in an inscription by a figure like that of the tablets; and in another place by a distinct name, much resembling that of a female deity, found on some of the cases of the mummies, and who might consequently be called *Paamylia.*

NILUS.
ⲫⲓⲁⲣⲟ

17. The Nile seems to have been reckoned amongst the deities of Egypt, and the character which appears to be appropriate to a river is found occasionally in the tablets, followed by a vessel and a spiral, which seem indeed to make a part of the name, and are accompanied by epithets of respect. This character has already been considered by Kircher and others as representing a nilometer; and the deity in question can only be distinguished by the name NILUS.

18. The sacred characters denoting APIS are pretty clearly determined by the triple inscription; the enchorial name is perfectly so.

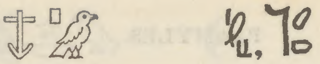
APIS.

If, however, any doubt remained on the subject, it would be removed by an examination of the inscriptions on four vases, found by Paul Lucas (*Voyage dans la Turquie,* vol. i. p. 346, Amsterdam, 1720, in 2 vols. 12mo) at Abousir, the Busiris of the ancients; that is, the BE OSHIRI, or sepulchre of Osiris, as Diodorus very properly translates it. There is a received tradition that Apis was worshipped and buried here; and Lucas established its truth by finding the mummy of a bullock in the catacombs. Now, all the inscriptions on the vases end with a bullock preceded by this character, though the angles are turned in a different direction from those of the inscription of Rosetta; so that the two forms of the character seem to have been used indifferently. With this latitude, we have no difficulty in identifying the name as it occurs in almost every line of the inscriptions upon the great sarcophagus of granite, called the Lover's Fountain, formerly at Cairo, and now in the British Museum. There is some reason to suppose, from the frequency of this name, that it may have been intended for receiving a mummy of the bull Apis; although it must be confessed, that in several other monuments the names of the deities are introduced in a manner somewhat similar, with an evident relation to the designation of some human being, whom they are intended to commemorate.

MNEUIS.

19. The enchorial name of MNEUIS is very completely ascertained by the inscription of Rosetta; and from a comparison of different passages in the manuscripts, there is reason to infer that it was intended as an imperfect representation of a basilisk and a tear; emblems which are repeatedly found in the great ritual, connected with the figure of a bullock. The sacred cow, in the manuscripts sent home by Mr Bankes, is denoted by a serpentine line with two dots, followed by the term goddess. We may venture to distinguish her by the temporary name *Damalis.* That of Io would imply too great identity with the Greek mythology.

HYPERION.



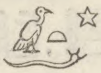
CTERISTES.

20. In the tablets representing the judgment of the deceased, we generally find two personages standing by the balance, and apparently weighing his merits; one with the head of a hawk, the other with that of a wolf, and seeming to officiate as the good and evil genius of the person. The former, denoted by a hawk with a bar, and sometimes also a spear, appears, from various monuments, to have some relation to the Sun or to Horus, and may therefore be called Hyperion; the latter is often observed to be employed in the preparation of a mummy, and may be called from this occupation Cteristes, or the embalmer. He is also frequently represented on the coffins of mummies, and elsewhere, under the form of a wolf sitting on a kind of altar; and he seems to be an immediate minister of Osiris. His hieroglyphical name is a feather, a wavy line, and a block; or a hatchet under a sort of arch.

TETRARCHA.

ANUBIS.

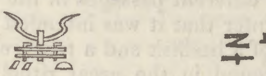
MACEDO.



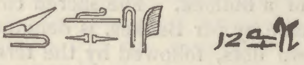
HIERACION.

21. Under the bier on which a mummy lies, and in many other situations near the person of the deceased, we find representations of four deities who seem to be concerned in the operation of embalming, and who might even be supposed to preside over the different condiments employed, their heads frequently serving as covers for four jars, of the kind sometimes called Canopi. They may also very properly be considered as attendants of Isis, who seems to be a still more important personage on such occasions. The first of the four has generally a human head, and may be called Tetrarcha; his name contains a sort of forceps, and a broken line. The second and third have respectively the heads of a dog or baboon, and of a wolf; and they agree very satisfactorily with the well-known character of Anubis, and with that of Macedo his companion, mentioned by Diodorus as having a wolf's head, and whose name may possibly have some relation to manchat, *a worker in silver*, as that of Anubis has to nub, *gold*. The hieroglyphic name of Anubis differs from that of Apis only in having the angles directed immediately upwards, a circumstance which is not so indifferent to the signification as it at first appeared; that of Macedo has a vulture with a star, and sometimes an arm instead of the vulture. The fourth of these deities is represented with the head of a hawk, and may therefore be called Hieracion. He is denoted by a water jar, with three plants somewhat resembling leeks or onions.

CEREXOCHUS.



BIOXIPHUS.



PLATYPTERUS.

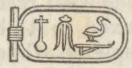
MASTIGIAS.

SORAEA.

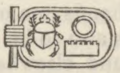
22. Amongst the many hundreds of deities who are represented in various inscriptions and sculptures, some of the most remarkable are two personages with the heads of wolves, the first characterised by a sort of raised frame or banner, and a pair of horns, which may be expressed by the pseudonymous or temporary term Cerexochus, and the second by a half bow, and a sword or knife, whence he may be called Bioxiphus; a figure with a human head, generally wearing a feather on it, and denoted by a broad feather reversed, which is implied in the name Platypterus; another wearing a cap with a whip in it, who may be called Mastigias; and a fifth in the form of a female, distinguished by a bier, who, at Edfou, bears a tear on her head, and who may be called Soraea.

2. *Kings.*

THOTHMOSIS.



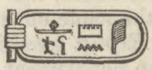
MESPHRES.



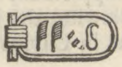
MISPHRAGMUTHOSIS.

1. We are informed by Pliny, that the Alexandrian obelisk was erected by Mesphres or Mestires, the reading of the different manuscripts being different; and since no king of the name Mestires is mentioned by other authors, we may consider Mesphres as the Mephres or Mesphris who succeeded his mother Amersis about 1700 B. C. or perhaps a century or two later. The hieroglyphical name of his father contains that of the god Thoth, and may therefore possibly have been intended for the Thothmosis of the chronologers, who is said to have been the grandfather of Mesphres. The obelisk at Alexandria, now called Cleopatra's Needle, like almost all others which contain three lines on each side, exhibits different names in the middle and the outer lines. From this circumstance, as well as from the greater depth of the sculptures, which is generally observable in the middle line, there is reason to suppose that this line stood at first alone, and that the two on each side were added by a later monarch. The Lateran obelisk, however, is remarkable for exhibiting the name of Mesphres on all the lines of the different sides. The Constantinopolitan obelisk has only one line on each side, with the name of Mesphres the son of Thothmosis. The same name is also found on the gateway of the fifth catacomb, at Biban-el-Molouk; on a pillar of the palace at Karnak, and in a splendidly-coloured bas-relief on one of the interior architraves of the gallery; as well as on a seal of Denon, and on some others which were brought from Egypt by Mr Legh. The Isean obelisk of Kircher has a "son of Mesphres, favoured by Phthah;" we must therefore distinguish this king by the name Misphragmuthosis, who is recorded as the son and successor of Mesphres.

TITHOUS.

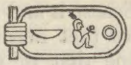


EOA.

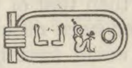


Vocabulary.

MEMNON.

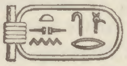


AMENSES.

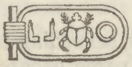


2. A multitude of ancient Greek inscriptions identify the statue of Memnon, celebrated by all antiquity for its musical powers, which, Strabo says, he heard exemplified, though he could not very positively decide whether the sound proceeded from the statue or from some of the bystanders. In one of the inscriptions we find the word *Phamenoth*, not as a date, but as a synonym of Memnon, which must be considered as identical with the Phamenoph given by Pausanias as his Egyptian name, and with the Ammenoph or Amenophis of Manetho or others, which differs from it only as wanting the article. There is, however, some doubt to which Amenophis this statue properly belongs. Manetho makes Memnon the eighth king of the eighteenth dynasty, who may be called Amenophis the Second; but Marsham brings him down to the Ammenephthes of Manetho, or Amenophis the Fourth, principally because he thinks that only a successor of Sesostris could have been well known in Asia; and he even supposes him to have been later than Homer, who, he says, never mentions him, though Hesiod calls him the son of Tithonus and Aurora. But, in fact, the name of Memnon does occur in the Odyssey, where Ulysses alludes to his beauty in a conversation with the shade of Achilles; and Hesiod could scarcely have mentioned a king as descended from a deity, that was not considerably earlier than his own time; so that the tradition of Manetho seems to be preferable to the mere conjecture of Marsham. At the same time, we cannot well call him Memnon the son of Thothmosis, the name of the father not agreeing with that of this king; and there is another circumstance which seems to lead us to the third Amenophis, intermediate between these two extremes, who was the son of Ramesses Meiamun, or Ramesses the lover of Ammon; namely, that Amenophis himself appears to have built a temple to Ammon in the isle of Elephantiné, and is called Meiamun in several of the hieroglyphical inscriptions still existing there. It appears, then, that the name Memnon must have been derived from Meiamun. Besides the different statues of the Memnonium, we find monuments of the same personage in almost every part of Egypt, though they are much more frequent at Thebes and in its neighbourhood. The name is marked on all the lion-headed goddesses of black granite which are now in the British Museum, and on some others which were in the possession of Mr Bankes. The first of this series having been purchased, as Bruce informs us, for a large price, by Donati, for the king of Sardinia, the inhabitants were induced to take some pains in digging the others out of the sand. The building called by the French the tomb of Osymandyas bears also the name of Memnon; and it is remarked by Strabo, that Memnon and Ismendes may probably have been the same person. The name is also found in the grottos at Biban-el-Molouk, on some statues representing Osiris, and in some inscriptions at Ombos, as well as on a seal of Denon. Mr Bullock presented to the British Museum a scarabœus of very hard stone, on which we find the name of Memnon, together with that of his father and mother, whom we may call, in order to preserve the mythological analogy, *Tithous* and *Eoa*, although without asserting that this Tithous was the builder of the Labyrinth, which some authors have attributed to a king named Tithoes, and others to Ismendes. The mother's name occurs also alone, as "the goddess mother," on the back of a beetle in Gordon's *Mummies* (plate xxii.), a circumstance which removes the doubt that might otherwise arise from the want of the female termination in the name; the father's is found upon a square seal in the possession of Mr Legh. There is another copy of the inscription of Mr Bullock's scarabœus, on a scarabœus belonging to Mr Palin, which had long been used by a Greek priest at Athens for stamping the paschal bread (Dubois, *Pierres Gravées*, Paris, 1817, pl. v. N. 5). The beautiful head brought from the Memnonium to the British Museum has only a part of the father's name remaining, which does not appear to be that of the father of Memnon, though the first three characters are the same; but the fourth is the pedestal representing Phthah; and a similar name is found on some other colossal statues and obelisks remaining in Egypt, as well as on a smaller figure of red granite brought by Mr Hamilton from Elephantiné. In the principal name upon the obelisk at Karnak, the final scale of the name of Memnon is exchanged for a pair of arms stretched upwards; a variation which may be expressed by calling it Amenuses or *Amenses*, from SHESH, a pair. The father's name is also a little like that of Tithous; but, that the difference is constant, may be inferred from its separate occurrence on a seal brought home by Mr Legh, a lion's head making a part of it in both instances. The true name and date of this personage must be considered as wholly unknown; though the resemblance of the name to Memnon makes it convenient to place them together. In Mr Boughton's minute golden image, engraved in the *Archæologia*, the name appears to be the same, but with the synonymous substitution of the hatchet for the judge.

HERON.



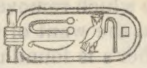
REMESSES.



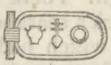
3. The obelisk at Heliopolis has every mark of considerable antiquity, and the shortness and simplicity of its inscription is appropriate to a remote period. Pliny says that Mitres or Mestires first erected obelisks at Heliopolis; he also mentions Sothis, and apparently Ramesses, as having left similar monuments of their magnificence in the same place. The principal name upon the obelisk now remaining at Matareah may also be observed in several other inscriptions, but with the substitution of two other names for that of the father, so that the name of the son must probably have belonged to many different individuals. This circumstance, as well as the sounds belonging to the different characters, agrees very well with Ramesses; for we have RE, *the sun*, and MES, *a birth*, and SHESH, *a pair*, so that we may venture to call it REMESSES; and we may take HERON for the father of the first Remesses, from Hermapion, though it is possible that he may be the Armais of Manetho; but we have scarcely sufficient evidence to appropriate to him that name. Another Ramesses seems to have been a son of Sesostris; a third Ramesses follows Ammenephthes in Manetho, and agrees with the Rhampsinitus of Herodotus, and the Remphis of Diodorus, who is mentioned as the successor of Proteus; and this may, perhaps, have been the Ramesses of the frizes of Montagu and Ficoroni (*Hieroglyphics*, 7 Ou. 9 If), who seems, from the resemblance of the different parts of the work, to have been nearly contemporary with Sesostris. (*Hieroglyphics*, 7 H. I.) There is also on the Lions at the fountain of Aqua Felice, near the baths of Diocletian at Rome, another Ramesses, the name of whose father is a little like the name supposed to belong to Arsinoe.

Vocabulary.

SESOSTRIS.



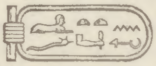
PHERON.



4. The obelisk erected by Augustus in the Campus Martius is said, by Pliny, to have been the work of Sesostris; and there are sufficient documents of its identity with that which had long remained buried near the Monte Citorio, and of which figures have been given by Zoega and others. The inscription was supposed, in the time of Pliny, to contain a compendium of the physical and philosophical learning of the Egyptians; but, in order to make this opinion credible, it would be necessary to admit that the princes of earlier days entertained very different ideas from those which have since been prevalent respecting the comparative importance of the abstract sciences, and of national prosperity and martial glory. If Sesostris was the son of Amenophis, he cannot have been the reigning king mentioned in this obelisk. But it may safely be attributed to Pheron the son of Sesostris, who, according to Herodotus, erected two obelisks; and the occurrence of the name of Sesostris as the father may be considered as sufficiently conformable to the testimony of Pliny. The same names are found, with a slight variation, on a small statue of basalt, very highly finished, now standing in the British Museum; and Denon has copied them from an inscription in the Memnonium.

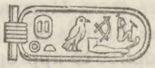
NUNCOREUS.

PROTEUS.

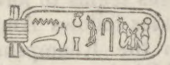


5. Nuncoreus, according to Diodorus, was another son of Sesostris; his name occurs also in Pliny, and we may consider him as the son of Sesostris mentioned in Montagu's frizes. The name is also found at Philae, and, with a slight variation, on an altar of basalt figured by Caylus (*Recueil*, tom. i. plate xix.), now in the King's Library at Paris. The remains of the same name may also be observed on a block, apparently of white sandstone, in the British Museum, which is figured by Norden, in its old situation, as a part of the foundations of Pompey's Pillar at Alexandria; and it occurs on a fragment of a statue brought by Mr Hamilton from Thebes. The name of Proteus, or Certus, otherwise Ammenephthes, is only known as the predecessor of one of the kings named Ramesses; and we may safely employ it for the father of the Ramesses of the frizes of Montagu and Ficoroni, the whole of which are remarkable for the excellence of their workmanship.

AMENOPHTHES.

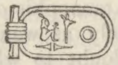


ANYSIS.

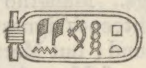


6. Until we obtain evidence of a more positive nature, we may give to the two kings mentioned on the sarcophagus of green breccia the names of Amenophthes and Anysis, supposing them to have lived about the time of Ammenephthes, or Amenophis the Fifth, and his successor Osorchon. The father's name might, without difficulty, be read Menephthah, supposing some titles to follow it. There are also two obelisks of the same king, brought from Cairo, which stand near the sarcophagus in the British Museum; and the style of the workmanship somewhat resembles that of the times of Sesostris and his immediate successors. It has been observed that neither of the names can well be Alexander's, since that of the father is repeated much more frequently than that of the son, which could not have happened if it had been meant for Philip; and Alexander had no son who could have been mentioned on his sarcophagus. Nor is it at all probable that Alexander should have erected any obelisks at Memphis or in its neighbourhood. The god Ammon is nowhere mentioned amongst the titles of the king, and holds only an inferior rank among the innumerable deities represented in the tablets. We find both the names, without any addition, on a dovetail of copper (engraved in Lord Valentia's *Travels*), which was found at Behbeit, the Atarbechis or Aphroditopolis of the ancients, situated on the branch of the Nile that runs to Damietta.

PSAMMETIUS.



NECHAO.



PSAMMIS.

7. We learn from Pliny that the Flaminian obelisk now standing near the Porta del Popolo at Rome, which was the smaller of the two formerly in the Circus Maximus, where they were placed by Augustus, and used as the gnomon of a dial, was the work of Senneserteus or Semnesyrtæus, who reigned in Egypt at the time when Pythagoras visited it. This king seems to have been the same with Psamuthis or Psammis; and the authority of the evidence is so much the stronger, as the period in question is not extremely remote. The father of Psammis, according to Herodotus, was Necos or Nechao. The two names occur on all the middle lines of the obelisk; and that of the father on the pillar of a colossal Isis in the *Supplement* of Montfaucon. The Sallustian obelisk, which seems to have been partly copied from the Flaminian, has them both. In the middle lines of both the obelisks at Luxor we find a name much resembling that of Psammis, which we may therefore call Psammetius, conjecturing that it may have belonged to Psammetichus, who reigned a little earlier. The father's name is not unlike in its import to that of Nechao, both implying *approved by Phthah;* and it is remarkable, that in Manetho's series, the predecessor of Psammetichus is also Nechao.

MENEPHTHES.

AMASIS.

8. Amongst the most common of all the names of the kings of Egypt, on a great variety of monuments, are those which were mistaken by Kircher for a sort of amulets or charms, which he denominated the Mophthomendesian tablets. They occur alone on three small obelisks only, the Medicean, the Mahutean, and the Monticœlian of Kircher; but they are found in the external lines of the Alexandrian, the two at Luxor, the Flaminian, and the Sallustian, whilst none are ever found exterior to them. They must, therefore, necessarily be attributed to one of the latest kings of Egypt; and there is none so likely to have made such a display as Amasis, a man of considerable magnificence, and at the same time of a cautious and artful character. Indeed we have no alternative left but to choose between him and some of the kings who revolted against the Persians, and who do not appear so likely to have had

leisure or finances for public works of splendour. His father's name, like that of Nechao, contains the character denoting Vulcan, and it may be called MENEPHTHES; but he was not the son of a king. Both the names are found in one of the middle lines of the Flaminian obelisk; and on that side the king is represented in the tablet as doing homage to his predecessor, who occupies the place of honour on the other side. The father's name seems to occur on the belt of a colossal statue in the palace at Karnak. On a fragment of stone in the British Museum the names are repeated in various directions, as if it had belonged to a floor or a ceiling. They also occur on a statue, considerably mutilated, in the attitude of kneeling; and in Montfaucon's *Supplement*, on the back of a colossal Isis, which seems also to have been begun by Psammis. On the eastern colossus at Luxor there is a name which might be taken either for that of Amasis or for that of the pseudonymous Psammetius; but the sitting figure is somewhat different. The victor in the naval combat at Medinet-Habou, who appears also frequently at Ombos, considerably resembles them both. Lord Mountnorris has a rough seal with the name of Amasis only, the epithet God being prefixed in a smaller character. The names also occur on a small obelisk lying at Tsan, the ancient Tanis, of which a sketch was brought home by Dr Merion.

PTOLEBERIUS.

DISCOZYGUS.

9. We find at Karnak the name of a king somewhat like Psammis, that of his father resembling a compound of Ptolemy and Berenice. Perhaps they are not very correctly copied, but they may stand, under the temporary names of DISCOZYGUS and PTOLEBERIUS, as specimens, somewhat singular, of a mixture of different dynasties; and in this point of view they may be placed between the old Egyptian kings and their Grecian conquerors.

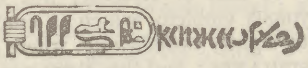
ALEXANDER.

ⲁⲗⲉⲝⲁⲛⲇⲣⲟⲥ

10. The name of ALEXANDER has not yet been identified in the sacred characters;[1] but it will appear hereafter that a knowledge of the enchorial form may possibly contribute very materially, at some future time, to assist us in determining it.

PTOLEMY.

ⲡⲧⲟⲗⲉⲙⲉⲟⲥ



SOTERES.

11. There can be no doubt whatever respecting the signification of the name of PTOLEMY, as it occurs on the pillar of Rosetta; but it is not quite so easy to determine its identity in some other cases, where it may possibly have been modified by contraction, mutilation, or combination. In this and a few other proper names, it is extremely interesting to trace some of the steps by which alphabetical writing seems to have arisen out of hieroglyphical; a process which may indeed be in some measure illustrated by the manner in which the modern Chinese express a foreign combination of sounds, the characters being rendered simply *phonetic* by an appropriate mark, instead of retaining their natural signification, and this mark, in some modern printed books, approaching very near to the ring surrounding the hieroglyphic names. The enchorial name of Ptolemy appears at first sight to be extremely different from the hieroglyphical; and it would have been impossible to deduce the one from the other, without a knowledge of the epistolographic forms of the separate characters, as ascertained by a comparison of the manuscripts. The beginning and end are obviously parts of the ring, which, in the sacred character, surrounds every proper name, except those of the deities. The square block and the semicircle answer invariably in all the manuscripts to characters resembling the P and T of Akerblad, which are found at the beginning of the enchorial name. The next character, which seems to be a kind of knot, is not essentially necessary,[2] being often omitted in the sacred characters, and always in the enchorial. The lion corresponds to the LO of Akerblad, a lion being always expressed by a similar character in the manuscripts; an oblique line crossed standing for the body, and an erect line for the tail. This was probably read, not LO, but OLE;[3] although, in more modern Coptic, OILI is translated a *ram;* we have also EIUL, *a stag;* and the figure of the stag becomes, in the running hand, something like this of the lion. The next character is known to have some reference to *place*, in Coptic MA; and it seems to have been read either MA, or simply M.[4] This character is always expressed in the running hand by the M of Akerblad's alphabet. The two feathers, whatever their natural meaning may have been, answer to the three parallel lines of the enchorial text, and they seem in more than one instance to have been read I or E;[5] the bent line probably signified great, and was read OSH or OS;[6] for the Coptic *shei* seems to have been nearly equivalent to the Greek *sigma*. Putting all these elements together, we have precisely PTOLEMAIOS, the Greek name; or perhaps PTOLEMEOS, as it would more naturally be called in Coptic.[7] The slight variations of the word in different parts of the enchorial text may be considered as expressing something like aspirations or accentuations. The appellation SOTERES, as a dual, is well marked in the inscription of Rosetta, and the character, thus determined, explains a long name in the temple at Edfou, which must mean "the two saviour gods," with various titles of honour, such as "the agents of Phthah, the emblems of triumph, the approved of Phré, the favoured of the Nile, the venerable consorts in empire."

BERENICE.

---

[1] The name of Alexander has now been several times identified in the sacred characters or hieroglyphics. It occurs on the edifices of Karnak, where it is written ΑΛΚΣΑΝΤΡΣ and ΑΛΚΣΝΡΟΣ. (Champollion, *Précis du Syst. Hiérogl.* p. 84. Paris, 1828.) We also learn from Mr Salt, that, besides the granite sanctuary at Karnak, the name of Alexander, preceded by mystic titles, is found on the granite propylon in the island of Elephantiné. In these titles the word AMUN is clearly distinguished. It likewise occurs in another place, where it is preceded by a ring containing in hieroglyphic symbols the legend, "beloved of Amun-Phre." (*Essay on the Phonet. Syst. of Hierogl.* pp. 15 and 16.) We say nothing of ALEK-AMUN, though probably a contraction of the same name.

[2] This character is put down in Champollion's phonetic alphabet as one of the homophones of O, and as sometimes representing the diphthong OU.

[3] In the hieroglyphico-phonetic alphabet the lion represents, not LO or OLE, but the letter L simply, and is one of the best ascertained of all the phonetic characters.

[4] It is now set down simply as the letter M.

[5] Champollion reads the feathers I, E, AI, in the sacred characters.

[6] The bent staff, in the sacred characters, is now held to be one of the homophones of S.

[7] Champollion, after quoting this passage, observes, "Et moi, qui ai considéré chaque caractère hieroglyphique comme une simple lettre, et non pas comme pouvant représenter chacun une ou deux syllabes, je n'ai pu et dû obtenir que ΠΤΟΛΜΗΣ, squelette du nom Grec Πτολεμαιος." (*Précis*, p. 29.)

Vocabulary.

12. The wife of Ptolemy Soter, and mother of Philadelphus, was BERENICE, whose name is found on a ceiling at Karnak, in the phrase, "Ptolemy and . . Berenice, the saviour gods." In this name we appear to have another specimen of syllabic and alphabetic writing combined, in a manner not extremely unlike the ludicrous mixtures of words and things with which children are sometimes amused; for, however Warburton's indignation might be excited by such a comparison, it is perfectly true that, occasionally, the sublime differs from the ridiculous by a single step only. The first character of the hieroglyphic name is precisely of the same form with a basket represented at Biban-el-Molouk, and called, in the description, *panier à anses;* and a basket, in Coptic, is BIR.[1] The oval, which resembles an eye without the pupil, means elsewhere *to,* which in Coptic is E;[2] the waved line is *of,* and must be rendered N; the feathers I; the little footstool seems to be superfluous;[3] the goose is KE, or KEN.[4] Kircher gives us KENESOÜ for a goose, but the ESOÜ means gregarious, probably in contradistinction to the Egyptian sheldrake, and the simple etymon approaches to the name of a goose in many other languages. We have, therefore, literally BIRENICE; or, if the N must be inserted, the accusative BIRENICEN, which may easily have been confounded by the Egyptians with the nominative.[5] The final characters are merely the feminine termination. The enchorial text affords us a remarkable instance of the diversity which was allowed in the mode of representing the same name. The first character has not the least resemblance to the basket; but the first and second together are very commonly used in the manuscripts, as a coarse representation of a boat, which was called BARI, or possibly BERE; for it is doubtful whether Kircher had any other authority than that of Diodorus for BARI, and the word BEREZOUTS is used for another vehicle. The enchorial N may possibly have been derived from a horizontal line, turned up at one end. We have then the three dashes for the I, and the two angles seem to have answered to the KE, for a bird is not uncommonly scribbled in some such manner; so that we have either BARINICE or BERENICE, by a combination somewhat different from the former.[6]

PHILADELPHUS.
ⲙⲁⲓⲥⲟⲛ

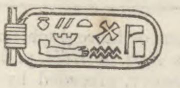
ARSINOE.

EUERGETES.

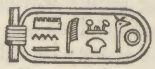
PHILOPATOR.
ⲙⲁⲓⲓⲱⲧ

EPIPHANES.

PHILOMETOR.
ⲙⲁⲓⲙⲁⲩ



Cleopatrides.



13. The temple at Ombos was dedicated, as we find from the Greek inscription copied by Mr Hamilton, "in the name of the divine Ptolemy Philometor and Cleopatra, and their children, to Arueris Apollo, and the other gods of the temple, by the infantry and cavalry of the nome." We may therefore expect to find in it the names of these sovereigns, together with those of some or all of the earlier Ptolemies; and, accordingly, we are able to determine, without difficulty, some epithets which seem to be characteristic of this and the two preceding reigns; but hitherto nothing has been observed that can be considered as so clearly denoting either Philadelphus and his queen Arsinoe, or Euergetes and his Berenice, although some assistance might have been derived, in identifying them, from the enchorial text of Rosetta. We have, however, in the same temple, a name, evidently compound, in which a basilisk is followed by two feathers and a bent line; and to judge from a comparison of the enchorial text with the manuscripts, a basilisk ought to be the emblem of EUERGETES. The part of the name preceding it is, however, not Berenice, and must, therefore, in all probability, be ARSINOE, the daughter of Euergetes. But it seems impossible to attempt to compare the characters employed with the sounds; since they sometimes occur in an inverted order, which the sounds could not do. Indeed, the name seems to be very often repeated in situations where its most essential parts seem to be a quadrant of a circle, two feathers, and a bent or broken line; in other places, as at Denderah, the bird, the hand, and the oval, are added; and it is not impossible that the quadrant may have been meant as a representation of a lentil, which in Coptic is ARSHIN, and which alone may have been sufficient to identify the name. It occurs in the celebrated zodiac of Denderah, and very frequently at Philae, and it may possibly, hereafter, lead us very readily to discover the hieroglyphical name of Philadelphus. That of PHILOPATOR is satisfactorily ascertained by the assistance of the character employed for *father* in the Rosetta stone, though that character is much mutilated, and could not have been positively determined without this coincidence. The name is found in the temple at Edfou still more distinctly than at Ombos, and it occurs several times at Karnak. EPIPHANES is never distinguished in any other inscription by the characters appropriated to him in that of Rosetta; but we continually find a synonymous emblem, which is employed in the Rosetta stone to signify *enlightening,* where the Greek translation has EPIPHANES; and this character, placed between two hatchets facing each other, can only have meant the *illustrious deity,* or *deities.* In this form the name occurs very frequently at Philae, and in the temple at Edfou, where it seems to be the latest name. For the PHILOMETORES we have a character which occurs in some other monuments, and means apparently *mother,* the name containing it being found several times in the temple at Ombos. At Kous, or Apollinopolis Parva, there is another Greek inscription of the Philometores and their children; but in the hieroglyphics copied by Denon, the names of

---

[1] This character is now considered as one of the homophones of the letter B.

[2] In Champollion's alphabet, the oval, or "mouth" as he calls it, is set down as R.

[3] Champollion sets down "the little footstool" as a phonetic symbol of the letter K.

[4] The goose is now ascertained to be a phonetic representative of the letter S.

[5] According to Champollion, the hieroglyphical name of Queen *Berenice* is written BPNHKE, and not BIPENIKE or BIPENIKEN, as Dr Young had supposed. (See *Précis*, p. 32.)

[6] "Le nom de *Berenice,*" says Champollion, "est le *seul* sur lequel M. le Docteur Young ait essayé d'appliquer les valeurs phonétiques qu'il avait voulu déduire de son analyse du nom hiéroglyphique de *Ptolmée.* Tous les autres noms propres hiéroglyphiques, en si grande abondance sur les monumens Egyptiens, ont absolument résisté à cette application." (*Précis,* ubi supra.)

the sovereigns seem to be wanting, and that of a young prince only remains, a colossal statue of whom is figured by Montfaucon in his *Supplement*, having the same name in the belt, with the addition of *the son of King Ptolemy*; it will, therefore, be justifiable to distinguish this personage by calling him *Cleopatrides.* The divine honours which are so often attributed in these inscriptions to the reigning sovereigns, afford us an explanation of the Greek inscriptions to the *Synthronous gods of Egypt*, which repeatedly occur; and of the description *Fraternal gods*, as, indeed, Philadelphus and his queen are called in the Greek inscription of Rosetta.

3. *Private Persons.*

We find the names of six individuals expressed in the enchorial text of the inscription of Rosetta, though they are wanting in the distinct hieroglyphics; but, as they are clearly ascertained by the context, they are of considerable value in tracing the approach of the hieroglyphic to alphabetic writing. These are, AETUS, PHILINUS, DIOGENES, PYRRHA, AREIA, and IRENE.

AETUS.

PHILINUS.

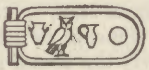
DIOGENES.

PYRRHA.

AREIA.

IRENE.

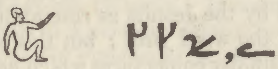
Ramuneus.



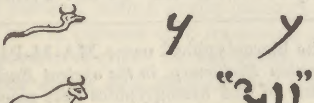
In Diogenes and Areia we discover no traces of the ring which is the usual characteristic of proper names; and, on the other hand, we find occasionally, in some of the manuscripts, the parts of the ring applied to a title of Osiris, which is more regularly written without any such distinction. A name of a private individual is inserted from a sarcophagus in the British Museum, engraved by Alexander, in his *Egyptian Monuments.* Its form is not that of a parallelopiped, but more accommodated to the shape of the body. The pseudonymous appellation *Ramuneus* has been derived from the elementary characters already observed in the names of RE and AMUN.

4. *Animals.*

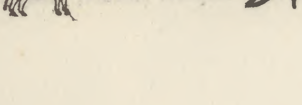
1. A MAN.
ⲣⲱⲙⲓ



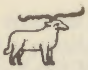
2. HIM.
ϥ,ⲙⲙⲟϥ



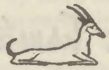
3. BULLOCK.
ⲉϩⲉ



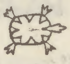
4. RAM.
ⲱⲓⲗ



5. ANTELOPE.

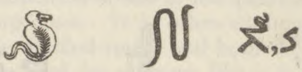


6. TORTOISE.
ⲉⲫⲱⲧ



7. CROCODILE.

8. BASILISK.
ⲟⲩⲣⲟ



1. A figure sitting on the ground, and stretching out one hand, seems to imply simply a *man* or person, which is certainly the sense of the enchorial character that commonly answers to it in the manuscripts; but in composition the figure often appears to lose this sense.

2. The horned snake, creeping along, is clearly meant, in some parts of the inscription of Rosetta, for *him* or *it*; although it has other senses in composition. It is very remarkable, that the enchorial character, and that of the manuscripts, resembling a Y, approaches extremely near to the Coptic F, which also means *him*; and HOF, or HFO, is the Coptic term for a snake; so that this coincidence seems to afford us another trace of the origin of the alphabet.

3–7. The *bullock*, the *ram*, the *antelope*, and the *tortoise*, are proved to be sometimes representations of the things which they resemble, by their occurrence in inscriptions accompanied by tablets; though some of them have probably elsewhere a metaphorical sense. The ram is often represented with two pairs of horns; the one natural, the other imaginary. The *crocodile* is identified by a very distinct drawing in a manuscript sent home by Mr Bankes, and is repeatedly designated in the text by a figure representing it. The deity with a crocodile's head is a separate personage, and is denoted by a figure of the same animal with the tail turned under it.

8. The asp or *basilisk* is so coarsely represented in the stone of Rosetta, that the object intended by it could not have been conjectured without a comparison with other inscriptions; the context was, however, sufficient to determine its meaning from the examination of this monument alone.

5. *Inanimate Objects.*

1. EGYPT.
ⲭⲏⲙⲓ

2. MEMPHIS.
ⲙⲉϥⲓ

3. RIVER.

Vocabulary.

26. GOLD.	ⲛⲟⲩⲃ	27. SILVER.	ϩⲁⲧ	28. OFFERINGS.		
1. The essential parts of the name of EGYPT seem to be the square and the wheel, signifying *splendid land.* In addition to these, or their rudiments, the enchorial word has at the beginning a character which generally answers to an arm holding a feather, or to the flame of a lamp, an emblem which seems also to relate to Egypt in one of the lines of the inscription of Rosetta. A flame and a heart are mentioned by Horus Apollo and by Plutarch as employed in the name of *Egypt;* but a word occurring so frequently is very likely to have been expressed in a variety of ways. The exact combination of characters generally used on the stone has not been observed in any other inscription.

2. The name of MEMPHIS cannot be determined without some uncertainty; the line of hieroglyphics in which it is contained being in several respects obscure.[1]

3. The character supposed to denote the Nile, as a deity, must also sometimes be understood as merely meaning a *river;* and there is reason to think that the Nile itself was generally called by the Egyptians *the river* only. The enchorial character used to denote both the Nile and a river, or canal, sufficiently resembles the hieroglyphic to favour this interpretation; and it is in some degree confirmed by the occurrence of the character alone on a water jar of Pieresc, delineated in Kircher's *Œdipus*, and, together with other characters, on the five vases found by Paul Lucas at Abousir. By accident, Kircher appears, in this single instance, to have been right in one of his conjectures; for he calls this character a Nilometer, and considers it as emblematic of the Nile.

4. The word *Greek*, in Coptic UININ or OUEININ, in Thebaic OUEEIENIN, supposed to have been derived from *Ionian*, seems to exhibit in its form something like an imitation of the sound. The curve on a stem is sometimes exchanged for the term *divine*, and appears to mean *glory*, in Coptic OOU or OÜ, which is nearly the sound attributed by Akerblad to the enchorial character, a little like the Hebrew ו. The feather, as in Ptolemy and Berenice, may be read I or EI, having the three dashes to express them, as usual, in the enchorial text; the serpent is ENEH, *ever;* and the hat, which looks a little like a plough, is equivalent to the waved line, and must be read N; so that we have very accurately OUIENEHN, which seems to be near enough to OUIENIN to justify us in considering these characters as phonetic.

5. The ladder is well marked as meaning *country.* It may perhaps be intended to represent a field with its divisions; but it is uncertain whether or not it is the same symbol which enters into one of the names of Arueris, the sculptures of the Rosetta stone being by no means highly finished.

6. It is remarkable that the wheel, signifying *land*, had been noticed by the Jesuits as resembling the old Chinese character for the word *field;* but this is the only one of a multitude of similar conjectures which has been justified by more complete evidence. (*Phil. Trans.* 1769, pl. xxviii.)

---

[1] The name of *Memphis* or *Memphe* appears to be a Greek abbreviation of the hieroglyphical name MA-M-PHTHAH, the *temple or sacred place of Phthah*, which, according to Dr Young (*Rudiments of an Egyptian Dictionary, in the ancient Enchorial Character*, pref. London, 1831), was also probably the first name of Cairo. The phonetic value of the hieroglyphics here placed opposite the word *Memphis* seems to be HMSRN; a combination which, though no doubt "in several respects obscure," may be resolved into HA-MISR, with the mark of plurality, N, subjoined.

7. The star is shown by inscriptions accompanying the zodiacs, to relate to a real *star*. It has also elsewhere a figurative sense, meaning an attendant or ministering spirit.

8. The open square is found in both the combinations of characters which are most commonly used for expressing a *temple;* the feather signifies ornament or consecration, and the oblong figure either the sacred inclosure or a sacred seat, the character for a god being sometimes placed within it. The feather is occasionally converted into an inclined oval, the square being at the same time a little altered; a difference which may be observed in other inscriptions as well as in the Rosetta stone.

9. The character representing a *shrine* so much resembles the object which it denotes, that it was the most readily identified of all which were found on the stone of Rosetta. The character signifying a *priest* was the second; and the combination of both afforded a full confirmation of the truth of the explanation. The enchorial character for a shrine is derived from the sitting statue which always accompanies it.

10. The open square, occurring in *habitation* as well as in *temple*, must probably have meant *house* or *building*, or possibly *stone* only.

11. The *throne*, or chair of state, occurs in a great variety of tablets. It evidently bears its most natural signification in the character denoting statue (No. 23), and in some other instances; but it appears to bear, in some inscriptions, the metaphorical sense of a residence or habitation.

12. The *column*, or pillar, is too much like the object it denotes to allow us to doubt respecting its meaning, considering the sense of that part of the inscription of Rosetta in which it occurs.

13. The characters denoting a *diadem* are sufficiently determined by the first inscription of the stone; and they so much resemble the corresponding passages of the enchorial text, that we can scarcely hesitate to admit the intimate connection of the two modes of writing without seeking for any further proofs.

14. The sacred *ornaments* are expressed by three feathers fixed to a bar, which appears to be held by two arms. The remaining part of the character occurs very frequently as a sort of termination, and seems to answer to *ments*.

15–20. The boat or *ship*, the *spear*, the *bow*, the *arrow*, the *censer*, and the *bier*, are sufficiently identified by the comparison of various tablets with their inscriptions. The *ship* occurs frequently as denoting the sacred boats, in which the representations of the deities are conveyed, though they are not always accompanied by water. But it has been observed, that the Egyptians attributed ships rather than chariots to the sun and moon as gliding smoothly through the skies. The first part of the enchorial word, which has been supposed to be a B, is evidently identical with the character always found in the manuscripts written in the running hieroglyphics as the first part of the delineation of a ship. It is remarkable, that in the inscription at Esneh, as copied by the French, the point of the arrow is turned towards the back of the bowman, instead of being directed towards the enemy.

21. The *tear*, in some of its representations, is very clearly expressive of the thing intended; and this resemblance, together with its frequent attendance on a corpse and a bier, is sufficient to explain its sense. It occurs also sometimes within a border as a peculiar deity; but it seems to be much more commonly emblematical of Osiris, of Apis, or of Mneuis. It is not unfrequently found as a detached figure, in a kind of pottery, with a green glazing, and may perhaps have been worn, instead of a mourning ring, as a memorial of a departed friend. It has most commonly been called the *equi sectio*, and supposed to represent a horse's head, or the rostrum of a ship, whilst the ingenious Kircher has made it a *phallus oculatus*. Amongst the antiquities collected by Lord Mountnorris in Egypt is an eye seen in front, and apparently shedding a tear.

22. The character for an *image* seems to mean *a wrought man;* for the hands, connected with an eye, appear to be holding an oar as an emblem of *labour*. The same character, with a slight variation in the form of the eye, means a rower.

23. The sitting statue has no character to imply wrought; but it is followed by a bent line, which seems to be a term of respect, and may possibly answer to OSH, *great*. The same bent line occurs on the great sarcophagus of green breccia as a personification of one of the qualities of Osiris, probably his *magnificence*. It is often exchanged in the manuscripts for the divided staff; and both are represented in the running hand by a figure like a 9 or a 4. In the enchorial text this character seems sometimes to be expressed by a single line, either straight, or bent sideways into an angle like part of a K. A similar *divine statue* is decreed to "King Nuncoreus, the son of Sesostris," on Mr Montagu's frize. (See *Hieroglyphics*, 7 S l.)

24. *Letters* are denoted by a character which seems to represent some of the materials employed in writing, and which is indeed not extremely unlike an inkstand figured in Caylus's *Recueil*, and consisting of two parallel tubes at some distance from each other, with a cover connected by a chain instead of a hinge. Besides the very well marked passage in the Rosetta stone, the character occurs in many manuscripts near the representation of a Thoth employed in writing; and the enchorial character corresponding to it is also found in the term *hierogrammatists* or *sacred scribes* at the beginning of the inscription.

25. In the numerical tablet of the great French work, believed to have been found at Karnak, a character may be observed which frequently precedes a numeral, and which resembles a weight with its handle. Hence we may conjecture, with considerable probability, that it represents some *weight* of unknown value.

26. The enchorial character for *gold* is perfectly well determined; and its resemblance to a little vase under a sort of arch is so strong that we may safely attribute the same sense to this hieroglyphic, although it appears to be wanting in one or two passages of the sacred inscription of Rosetta, where it ought to be found. In the great ritual we observe this character immediately preceding a shrine, as if a *golden shrine* were intended; and, in several other places, it is connected with a number, as if it meant *pieces of gold;* for instance, in the green sarcophagus, with the number 360. Sometimes, also, it appears to be used in a metaphorical sense as a complimentary epithet of a monarch, or perhaps in allusion to his riches. Thus, on the black frize of Nuncoreus, we have over the king's figure the characters, "Joy, Life, Stability, Power, *Riches*, Like the Sun, for ever." (*Hieroglyphics*, 7 p.)

27. Near to the character for gold, in the margin of the great ritual, is a sort of open box, supported on a flagstaff; and a similar box, with a semicircle under it, seems to mean *silver*, at least it considerably resembles the enchorial character for silver, which is perfectly well ascertained.

28. We find, in several inscriptions, representations of objects which are also observable in the tablets accompanying them, although it is difficult to say for what they are intended. Two of these are copied from the frize of Ficoroni and Montagu (*Hieroglyphics*, 9 OKL, RSKL, 7 LMQ). The former seems to be a sort of cloak, with a fringe at the bottom; and the latter is a little like a pear; but this character does not occur so clearly in the inscription.

6. *Attributes and Actions.*

(See Plate CCLXXIV.)

1. The *crux ansata*, sometimes called the key of the Nile, is usually employed as a symbol of divinity; but its correct meaning is *life*, as Lacroze rightly conjectured, although his opinion respecting the origin of the character is inconsistent with the form of its oldest and most accurate delineations; and there is no one instance in which it is so represented as to stand in any relation to a sluice or a watercock. According to Socrates and Rufinus, the Egyptian priests declared to their Christian conquerors under Theodosius, who were going to destroy the Serapeion at Alexandria, that the cross, so often sculptured on their temples, was an emblem of the life to come. This passage has been understood by some authors as relating rather to the cross without a handle, which is observable in some rare instances, and indeed twice on the stone of Rosetta; but this symbol appears rather to denote a protecting power than an immortal existence. It happens, perhaps altogether accidentally, that one of the contractions for the word *god*, which are commonly used in Coptic, approaches very near to this character, except that the arms of the cross are within the circle.

2. *Eternity* is represented simply by a serpent rising in an oblique arch, and without horns; the serpent devouring its tail, and forming a ring, is never found as an Egyptian emblem. Horus Apollo says that eternity was denoted by a serpent having its tail hidden under its body, and that such serpents were called *uraei*, meaning in Greek *basilisks*, which agrees very well with the sense of the Coptic URO, *king;* but this description answers better to the *asp* of the inscription of Rosetta, which has also some relation to the representations of the deities, though it does not exactly mean immortality.

3. The cross with the serpent is a very common epithet in the sense of everliving, or *immortal*, or ÆONOBIOS; the waved line is in general a preposition, or a termination, meaning *of*, *to*, or *for;* and it appears to be synonymous with the hat or head-dress. Almost all authors have very hastily taken it for granted that this character must relate immediately to water wherever it occurs, although we find it repeatedly in every line of the inscription of Rosetta, where water is not once mentioned. The fact, however, is, that its prototype seems to have been a stream of water, or of any other liquid, flowing *from* a vessel, and poured *on* some other object; and that the idea of the liquid was completely dropped in the general employment of the character, whilst that of the *connection* only was retained; the hat or cap being also similarly forgotten, whilst its connection with the head of the wearer only was suggested by its figure. In this compound character we have two particles nearly alike, the semicircle and the line; for that they cannot be very different is shown by the occasional substitution of two semicircles for the combination. One of them seems to serve for the connection between life and eternity, " life *for* ever;" and the other to make the new compound an adjective, " liv*ing* for ever."

4. The triangle or pyramid occurs very commonly amongst other emblems of prosperity and happiness; and it is found in the frize of Montagu and Ficoroni in the decided sense of an offering or a present in general, whilst in another place it is made an offering in its own form; so that we can only interpret it as signifying *joy*, or pleasure, or prosperity. (*Hieroglyphics*, 7 Mqr, Uqr; 9 Rc, Rl; 7 Uq, Urs.)

5. *Power* appears to be indicated by a sceptre having the head of an animal, which is often placed in the hands of the deities, and often stands with the cross, the pyramid, and the altar, as an emblem of the blessings attendant on the favourites of the gods. It is seldom used in the text of inscriptions, but it occurs once in that of Rosetta.

6, 7. *Stability* is denoted, on the Rosetta stone and elsewhere, by the altar, which seems to have been fixed in the ground as a column. When repeated it forms the verb *establish;* but it often occurs singly, and not uncommonly as an unconnected emblem, accompanied by other characters of similar import; and it is sometimes found as a detached figure formed of glazed porcelain. The two altars are very conspicuous objects in some of the epistolographic manuscripts, and are very useful in comparing them with the hieratic; but the word employed in the enchorial inscription of Rosetta seems to be derived from a different origin.

8. A drop or club over a basin, followed by a bent line, seems to mean *great strength*, though it is difficult to say what the character is meant to depict. In some other places it seems to resemble somewhat a kind of head-dress.

9. The bullock and the arm, which generally occur at the beginning of the inscriptions on the obelisks, agree very well with the epithet *mighty* in the translation of Hermapion. The arm is, in many other instances, used in compound characters.

10. *Victory* is denoted by a branch, perhaps by a palm branch, with a semicircle and a circle, sometimes preceded by a waved line.

11. The character signifying *fortune* somewhat resembles that which denotes *gold;* but instead of the arch we have an angular line, which seems to be intended for a pair of arms grasping the vase. The whole assemblage approaches also a little to the form of a pocket, or purse, as it is frequently delineated.

12. The open square, bent inwards, clearly means *splendour* or *glory*, though it is uncertain what object it is intended to represent. In some cases a crescent seems to be substituted for it, as if it bore some relation to the sun, and the moon afforded a parallel sense.

13, 14. *Illustrious* is expressed, in the inscription of Rosetta, by the open square, for *splendour*, the oval, which signifies addition or respect, making it a kind of superlative, and the pair of legs, which very naturally convey the idea of *bearing*, or possessing; so that the whole forms the epithet EPIPHANES. This assemblage is, in some of the manuscripts, very commonly followed by a bird, or its equivalent, a half arch, apparently serving as an intensive.

15–17. The feather, when alone, seems to imply *honour*, as well as when accompanied by a man stretching out his arm, or by a bird. The bird also frequently stands alone in similar passages, and must be translated *respect*, or *respectable*. The block with the bird has also manifestly the same sense in the great ritual, and the vase with the bowl is so nearly synonymous with it that we can only translate it *venerable;* and these characters are frequently exchanged for a sort of bench, with a dash under it, a symbol which, however, may possibly have been deduced from some different origin. The sense of the feather is peculiarly illustrated by its occurrence with a drop or club, a serpent, and a line, at the beginning of a great variety of inscriptions, apparently signifying *immortal honour to.*

18. The eye, either with or without the pupil, and either preceded or followed by the undulated line, has a sense somewhat similar to all these, and is often employed at the beginning of the honorary inscriptions. On the Rosetta stone it means distinctly *rite* or *adoration*. The enchorial character corresponding to it expresses simply *doing;* and in Greek the same word signifies *to do* and *to sacrifice.*

19. *Worship*, or the Greek *therapeia*, is denoted by a very unintelligible character, resembling a kind of cap-

stan, which is frequently delineated in the boats of the tablets, if it is not intended for some emblematical figure erected in the boats. On the great green sarcophagus, the long bent line is a snake, and the point projecting upwards from the middle is a sword. But these resemblances afford us little or no assistance in tracing the connection between the whole emblem and its sense.

20, 21. The character denoting *father* is found in some of the inscriptions of the Ptolemies in such circumstances that it might as easily be supposed to mean mother; but, by means of Mr Bullock's scarabœus, compared with some other monuments, another character having been determined for *mother*, it became easy to identify the symbol for father on the Rosetta stone, where it had been a little injured, and imperfectly copied in the engravings.

22. The frequent occurrence of the Egyptian goose or sheldrake, with a circle over it, between two proper names, sufficiently points out the meaning of these characters, which can only relate to the connection between them, and which must naturally mean *son*. The circle may perhaps be intended for an egg; but in the painted sculptures the disc is red and the circumference light. The enchorial character nearly resembles the form in which some kinds of birds are usually expressed in the manuscripts. Mr Bailey also observed the occurrence of the bird between two proper names, and identified it with the *chenalopex* mentioned by Horus Apollo as employed to signify son, on account of its courage in defending its offspring. This quality might rather have been expected to lead to its adoption as a symbol for a parent; but its existence in the bird in question is confirmed by the observations of modern naturalists respecting the sheldrake (the *tadorne* of Buffon), which has generally been considered as the chenalopex, and resembles very accurately the best of the hieroglyphical delineations of the bird, although the colours, as exhibited in the *Déscription de l'Egypte*, are not correctly natural.

23. The same bird, with a leg or a dash instead of a circle, seems to mean a *minister* or *attendant*, especially in several parts of the inscriptions on the Lover's Fountain. There are also some other characters which seem to be nearly synonymous with these; one of them may possibly be meant for a *tail*, implying a follower, as SAT and SA are nearly alike in Coptic; another is sometimes worn as a collar, perhaps implying subjection, and meaning servant.

24, 25. Instead of the usual character for *son*, we sometimes find, between two names, a serpent with a globe substituted for the bird, and an oval for the circle; and the context seems to require that the meaning of these symbols should be a *daughter*, but probably with some particular character of royalty or divinity. At Philae we find a dual, meaning *sons* or descendants, as a son and a daughter, expressed apparently by two circles only.

26. A *child*, or *infant*, is represented by a figure bent as if sitting, and putting his finger on his lip. This is sufficiently established by the triple inscription; but it is still further confirmed by a plate of the *Déscription de l'Egypte* (*Antiq.* tom. ii. pl. lxxxvi. f. 1), in which a figure of this kind is represented as immediately derived from the father, who seems to be inspired by a beetle entering his mouth. The manuscripts afford us here some valuable steps by which the enchorial character is connected with the distinct hieroglyphics. Another figure, which is elsewhere used as corresponding to a beetle, is also found in the enchorial text in the sense of son or offspring.

27, 28. A circle, with an arm holding an angular line, means a *director*. The angular line is intended for part of a rudder; and the same character, with the addition of the figure of a boat, denotes the *pilot* or *helmsman*, as is obvious from many parts of the green sarcophagus. The circle and arm are also found in the character denoting *dedicate*.

29. A pair of arms holding an oar, and connected by a sort of sector, signifies a *rower*, and possibly also a labourer, or workman in general, as in *image*.

30. A stem of a plant, perhaps a reed, followed by an insect like a wasp or ichneumon, but probably intended for a bee, and by two semicircles, is the complete emblem for a *king;* but the reed is often used alone in the same sense, and the insect sometimes occurs without the reed. Plutarch says that a king was denoted by a leaf, THRION; and Horus Apollo tells us that a bee signified a people obedient to a king; hence this symbol might be interpreted *king of men*. Ammianus Marcellinus, however, asserts, more simply, that a king was denoted by a bee. It appears from the manuscripts that the beginning of the enchorial character, which Mr Akerblad read PHU, is derived from the elementary traces representing the reed, the semicircle, a waved line, and a sitting deity, meaning *the divine king;* an assemblage which often occurs on the green sarcophagus, and elsewhere, as applied to a royal person. The remainder of the enchorial character seems to represent a termination consisting of a semicircle and a vessel, which is often added to a name, apparently as a demonstration of respect, like the vessel and the spiral in the case of the god Nilus.

31. *Condition*, or subjection, is denoted by a character which somewhat resembles an altar with an offering of flowers, but which might also be intended for the cup of a flower with an insect hovering over it.

32. In the term *kingdom*, the crown is figuratively employed for its wearer; a metaphor common in many modern languages.

33. The character denoting a *libation* is very indistinctly traced in the sacred inscription of Rosetta, so that it would have been impossible to explain its original form without the assistance of any hieroglyphical monuments. The long water jar, out of which the kneeling figure is pouring a divided stream, somewhat resembles those which a modern Egyptian woman is seen carrying in a plate of Mr Legh's second edition.

34, 35. The vase with the stream, which frequently occurs in the character for *priest*, is sometimes found alone, and must therefore probably relate to some particular *ceremony* performed by the priests, approaching to the nature of a libation. On the monument of Rosetta the line is a simple curve, not waved; nor is the vase more distinctly represented. Instead of the sitting figure, a foot is sometimes substituted, as in the word *attendant;* and the enchorial character is a more tolerable approximation to this form than to the complete figure.

36. *Priesthood* is simply the *condition* of a *priest;* the character prefixed answering to the Coptic prefix MET, and to the Greek termination EIA.

37. The ornaments of the head are very generally used as indicating the person by whom they are worn; and flowers, probably those of the lotus, are frequently found on the heads of the priests, as well as in the inscriptions which accompany them. In the inscription of Rosetta the sense *sacerdotal* agrees very well with the context where this character occurs, though it cannot be deduced with absolute certainty from the comparison with the Greek.

38. It is by no means easy to explain why the figure like a buckle should clearly mean an *assembly*. Perhaps, however, the upper part may originally have been a crescent, implying monthly; and the scale or basin below is occasionally found supporting some offerings, which are set upright in it; so that the whole may have meant *a monthly exhibition*.

39. The character *god* is made an adjective by the addition of the waved line, and of the long drop, which seem

Vocabulary.

simply to convert it into the term *sacred;* or, if the drop has any other meaning, it can only relate to worshipping or honouring, as the character prefixed to the enchorial text, which is equivalent to the scale or basin, is elsewhere employed to signify *honour* or *attention*. In some other instances, a circle and a waved line seem to be employed in a similar manner, for connecting one character with another like substantive and adjective.

40. An epithet implying *consecrated* or *dedicated* is composed of a trident, or triple branch or root, followed by a bent line. It occurs very commonly near the beginning of inscriptions, on obelisks, and elsewhere.

41. A little oblique cross, over an arm with a feather, seems to mean *to give*, and perhaps to fight and to defend, as, in Coptic, the word TI has both these senses. It is often preceded by a circle and a semicircle.

42. The hand bearing the triangle or pyramid manifestly means, in the frize of Montagu and Ficoroni, *to offer*, as an oblation to a deity.

43. In the inscription of Rosetta, we find the word *dedicate* expressed by a bent line and a sitting figure, with the circle, and the arm holding the rudder. The character already interpreted *consecrated* precedes, but it is not absolutely certain that it belongs to, the same phrase.

44. The term *lawful* is naturally enough derived from a deity in his judicial capacity; the figure is preceded by a bird, placed between two semicircles, which must here mean *according to*, answering to the termination *ful*. Sometimes a curved line, supported by a stem, is substituted as a synonym for the figure of the judge.

45–47. The character representing *good* strongly resembles the figure of a lute, depicted in the chamber of the harps, amongst the catacombs, and may have alluded to the pleasing sound of music. The plural, with the scale or basin, which implies *bestowing*, makes the epithet EUCHARISTOS, which in Greek is somewhat ambiguous, meaning either *grateful* or *munificent*. The latter, however, must be its sense in this inscription, because *good gifts* or *delights* may be plural, but *gratitude* not so easily. The lute is also found denoting good in other parts of the inscription. The enchorial character for the scale could scarcely have been suspected to be derived from it, without the assistance of the manuscripts, which constantly exhibit an intermediate form, intended, perhaps, to comprehend one of the lines supporting the scale.

48. The semicircle, with two oblique dashes, seems to mean *great* in the name of Thoth, who is called, in the Greek inscription of Rosetta, Hermes the *great and great;* whilst, in other places, this character seems almost always to convey the sense of a dual. The enchorial epithet of Thoth is a little like the crown with two semicircles, which is most frequently found amongst the titles of Osiris, especially when he sits in judgment. The two kinds of hats, worn by the different deities, seem to be intended by the characters of the Rosetta stone, which express the *upper* and *lower* regions or countries. These two characters are also found together in the green sarcophagus as the names of two goddesses; and they occur together in one or two passages of some of the manuscripts, and in an inscription at Philae, so that, although the representation is very indistinct in the particular case of the Rosetta stone, there is little doubt that the cap of Osiris meant, in this case, *superior*, and that of Hyperion and other personages *inferior*.

49. A circle and a semicircle stand, in several passages of the inscription of Rosetta, for *others*, or *remaining*.

50. Possibly the bowl and the bird together mean *say* or *call*, and the figure of a man may serve to make the passive *called*.

51. The second bowl, substituted for the bird, does not appear very essentially to alter the sense, which is still a thing *said* or proclaimed, a *declaration*, or a decree.

52. The characters denoting *manifest* seem to have some analogy to *called*, though their derivation is obscure. The first character may either be intended for the country, or for a kind of flag or banner.

53. The ring, which implies a *name*, and which elsewhere distinguishes proper names, seems to be an imitation of the label, called a phylactery in the Greek inscription of Rosetta, on which the name of a figure was usually distinguished.

54. A disc, with rays descending from it, is one of the few characters in which the form gives us some assistance towards determining the sense, which is found to be *enlightening;* though the Egyptians do not seem to have been very correct in their delineation of the motion of light, which they make to diverge in curved lines, like those described by a common projectile.

55. The square block, the semicircle, and the chain, are employed very clearly in the sense of *loving* or *beloved;* in Coptic MAI. In the enchorial character the square and semicircle seem to be sometimes transposed, and sometimes changed into an oval.

56. *Preserver*, or *saviour*, is represented by a sort of trefoil, with a long stem, which answers to a cross or obelisk in the enchorial text; but, in other passages, the character takes the form of a still simpler club; and in others, again, it has something like a bulbous root.

57, 58. A frame like a ladder, supported by a stem, occurs sometimes as a part of a head dress, but it is difficult to say if it represents any other object. Followed by an arm, and a pair of legs, it signifies *set up*, and this combination of characters is of very frequent occurrence; sometimes also the bent line or divided shaft forms a part of it. In Coptic, *set up* is expressed by *set on foot*, which seems to retain the analogy of the hieroglyphical character. The substitution of a pair of feathers for the legs, however, does not appear materially to alter the sense; the context, where it occurs, requiring the word *prepare* or *construct*.

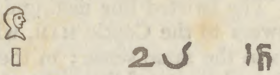
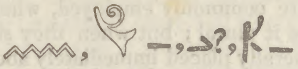
ϣⲁ

Vocabulary.

11. BY THESE.
(ⲕⲁⲧⲁ),ⲛⲧⲉ?



12. OF, TO.
ⲛⲧⲉ,ⲛ



1. Two ovals, with a semicircle and an arm, very clearly signify *in order that.* The ovals seem to mean *to* or *for*, and the arm *action* or *doing;* as our own *that* seems to be allied to the German *that*, which means *deed.* The same combination of characters appears to denote, in another passage, *to add to;* and one of the ovals is sometimes omitted. The Coptic may be either HINA or ETHBE.

2. The symbols employed in the sense *wherever*, seem to mean separately, *at, in, one*, or *in, place, one;* and, transposing the two last, we may make a very good Coptic word E-U-MA.

3, 4. The arm and chain signify *and* or *also;* and the oval sometimes takes place of the arm, without much variation of the sense. This combination is also found in the sense of *with*, or *together with.* The elementary ideas seem to be *put, with*, or *add, with.* Between the names of Ptolemy and Berenice at Karnak, the arm and chain are separate.

5. The half arch, or the fork, which is perfectly equivalent to it, followed by two curls and two semicircles, mean *moreover;* the reduplication probably resembling that of many of the Coptic verbs, which generally imply a continued action.

6. The combination of the loop or sling, with two semicircles and three ovals, means very clearly *likewise.* The loop seems to represent a bucket, intended for one of a pair, to be carried on a pole, as they are frequently delineated in the tablets, so that it must mean a *companion;* and accordingly we find it in a very common epithet of a king, on obelisks and elsewhere, with a circle and a bar, denoting *the companion of the sun*, or simply *resembling the sun.* In the enchorial character for *likewise*, the symbols seem to be transposed, and the loop is doubled.

7. An owl, signifying *in*, seems to be nearly synonymous with the half arch, which is also sometimes to be understood in the sense of *all.* Both these characters occur also in many instances where they can only be considered as marks of respect, and not very essential to the sense; and in this they resemble the Coptic prefix M, which is a particle not very distinctly intelligible, nor capable of being translated. It is also not a little remarkable, that the M of Akerblad's alphabet is the enchorial character which answers to both of these symbols.

8, 9. A hare over two waved lines is employed, either alone, or together with a head, dash, circle, and dash, which have separately a similar sense, for *upon, over*, or *at;* and it is remarkable, that a similar relation exists in Coptic between EHREÏ and EJO, JO, or DCHO, also meaning a head. The enchorial character, in some of its forms, is manifestly a coarse imitation of an animal. The head is always represented in the manuscripts by a character nearly like a Greek Σ; and this may possibly have been the origin of the Coptic letter JANJIA, if it was derived from a hieroglyphic; but it is equally probable that it may have been intended for a combination of a *delta* and a *chi.*

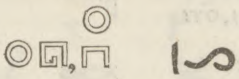
10. A semicircle and an oval signify *for*, and have a relation to time.

11. A ball, with two short appendages, one narrower than the other, occurs several times on the Rosetta stone, and seems to have been intended for a head seen in profile, which is often found on other monuments. This character, together with a dash, seems to signify *by the*, or *each;* for instance *every* year, or *every* month.

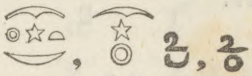
12. The hat, interposed between an image and the king, can only mean *of* or *for.* It is often substituted, in passages which are frequently repeated, for the waved line, each being probably equivalent to the Coptic NTE, or rather N; which also sometimes makes an adjective of a substantive, as NNUB, golden, from NUB, gold.

8. *Time.*

1. DAY.
ⲉϩⲟⲟⲩ.ⲙⲉⲣⲓ



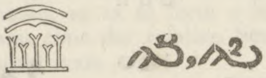
2. MONTH.
ⲁⲃⲟⲧ



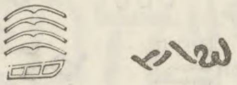
3. YEAR.
ⲣⲟⲙⲡⲓ

4. THOUTH.
ⲑⲱⲟⲩⲧ

5. MECHIR.
ⲙⲉⲭⲓⲣ

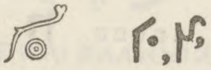


6. MESORE.
ⲙⲉⲥⲱⲣⲏ



7. FIRST DAY.
ⲥⲟⲩⲁⲓ

8. THIRTIETH.
ⲥⲟⲩ ⲙⲁⲃ



1. A *day* seems to be very naturally expressed by *splendour* of the *sun*, or sunshine.

2. A crescent turned downwards, with a star and the sun, makes up the character signifying a *month;* to which a semicircle and a scale or basin are sometimes added. Horus Apollo says that a month is denoted by a palm branch, or by an inverted crescent; but the crescent is too indistinct on the monument of Rosetta to have allowed us to recognise it without the assistance of the collateral inscriptions.

3. A *year* is denoted by a bent line with a little projection from the middle, which seems to represent a plant with an annual shoot or bud; it is commonly followed by a semicircle and a block or dash.

4. There is some little uncertainty respecting the exact limits of the characters denoting the first month, *Thouth.* The name seems to have some relation to gathering the harvest, and the emblem is probably intended for a field of corn; and, perhaps, as the year is said to have begun originally with the dogdays, the appropriation of this character to the first month may have been contemporaneous with the origin of the calendar.

5, 6. The sixth month, *Mechir*, is remarkable for having half as many crescents as the twelfth, *Mesore.* This relation would without doubt be further illustrated if we could discover any thing like a calendar among the immense mass of Egyptian literature which is still in existence. The manuscript which Montfaucon calls a calendar, merely because it is divided into twelve columns, has no pretensions to the name.

7, 8. The symbol for the sun seems to be employed in the designation both of the *first day* of the month, the NEOMENIA of the Greek inscription, and of the last, or *thirtieth day.* Of the characters following the sun, the one seems to mean good, or rather *new*, as in Thouth, the month of the new year; the other *old* or *last.* This character might be taken for a serpent, or for a branch of a tree; but it seems more probable that it is intended for the *tail* of an animal, since it occurs in several passages of the manuscripts as representing a tail; and the tail of the month is sufficiently expressive of the sense.

9. *Numbers.*

1. ONE.	ⲟⲩⲁⲓ, ⲟⲩⲓ	2. FIRST.	ϩⲟⲩⲓⲧ	3. TWO.	ⲥⲛⲁⲩ, ⲥⲛⲟⲩⲧ	4. SECOND.	ⲙⲁϩⲥⲛⲁⲩ	5. THREE.	ϣⲟⲙⲧ	6. THIRD.	ⲙⲁϩ ϣⲟⲙⲧ	7. THRICE.	ϣⲟⲙⲧ ⲛⲥⲟⲡ	8. FOUR.	ϥⲧⲟ	9. FIVE.	ϯⲟⲩ	10. SEVEN.	ϣⲁϣϥ	11. EIGHTH.	ⲙⲁϩ ϣⲙⲏⲛ	12. TEN.	ⲙⲏⲧ, ⲙⲏϯ	13. SEVENTEEN.	ⲙⲉⲧϣⲁϣϥ	14. THIRTY.	ⲙⲁⲡ	15. FORTY-TWO.	ϩⲙⲉⲥⲛⲁⲩ	16. A HUNDRED.	ϣⲉ	
17. A THOUSAND.	ϣⲟ	18. MCDXXVIII.	ϣⲟ ϥⲧⲟ ϣⲉ ϫⲟⲩⲧ ϣⲙⲟⲩⲛ	19. SEVERAL.	ϩⲁⲛ, ..ⲟⲩⲓ	
1. *Units* are denoted by short lines, like the Roman I. Mr Akerblad first noticed the first three numerals in the last line of the sacred characters of Rosetta, where the Greek text is deficient, and the words "first and second" only remain; and this observation alone was sufficient to prove that the hieroglyphical characters related to a real language, and were not simply ornamental decorations, as some persons have imagined.

2–11. The twisted line distinguishing the *ordinal numbers* answers to the Coptic MAH, which is prefixed to the cardinals in the same sense; in the enchorial text the corresponding character follows the number. The *three* points are more commonly employed, when they follow a word, to make it plural; but when they signify a numeral, they are generally placed immediately above some other character; and, in the enchorial inscription, this numeral is distinguished by making the lines oblique, and joining them.

12. For the number *ten* we have a Greek *pi*, either square or rounded, not only in the inscription of Rosetta, but in many other places.

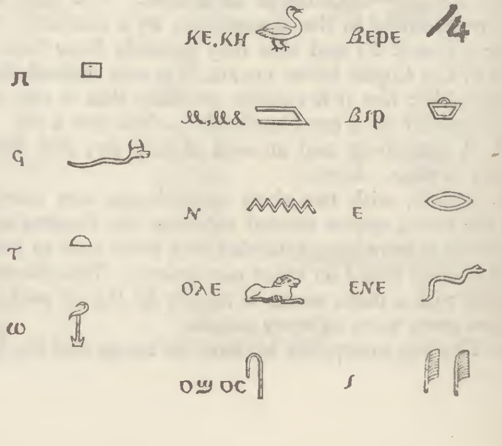
13. We find the number *seventeen* occurring twice as a date in the inscription of Rosetta; the Greek text, in another part, alluding to the same period, has *eighteen;* and the enchorial words are too indistinctly marked to allow us to judge of the identity or diversity of the two numbers; but the difference of a day is of no consequence, since the festival of the "assumption of the kingdom" may easily have begun on the 17th of Mechir, and continued till the next day, which is the date of the decree.

14, 15. The enchorial character for *thirty*, when applied to years, seems to be the same as is elsewhere used in the sense of the *thirtieth day;* but the numbers are almost always confused in the running hand, and exhibit several deviations from the regular system of the sacred characters. The number *forty*, for example, in the remarkable passage relating to the forty-two assessors of Osiris, seems to be denoted by a single line with a dash on it.

16–18. The curve, like the figure 9, meaning *a hundred*, and the notched circle, supported by a cross, denoting *a thousand*, occur, in several inscriptions, so combined with units and tens, as to leave no doubt respecting the numbers which they represent. This is particularly evident from the consideration of an inscription "believed to have been found at Karnak." (*Déscription de l'Egypte, Antiq.* tom. iii. pl. xxxviii. F. 26. . 30.)

19. *Plurals* are distinguished by writing a character three times, or by putting three dashes after it, and sometimes, perhaps, though very rarely, before it; occasionally also by repeating a part of a collection of symbols once only. In the manuscripts, the three dashes are generally joined into a crooked stroke, which, in the enchorial inscription, sometimes both precedes and follows the word; whilst, in other cases, the second stroke is converted into a single vertical line, which serves to limit the extent of the characters meant to be made plural; the representation being so imperfect, that this assistance is more required than in the sacred characters. And it may be observed, that this second mark is never wanting in the enchorial inscription, as it must frequently have been if the character had been alphabetical; since many of the Egyptian plurals end precisely as their singulars do, and even when they differ from them, it is not by the addition of any one uniform termination.

10. *Sounds.*



Specimens.

The phonetic characters, according to the traces which may be discovered in the words *Berenice*, *Ptolemy*, *Greek*, and some others, will afford something like a hieroglyphic alphabet, which, however, is merely collected as a specimen of the mode of expressing sounds in some particular cases, and not as having been universally employed where sounds were required. The SUPPOSED ENCHORIAL ALPHABET subjoined is applicable to most of the proper names in the inscription of Rosetta, and probably also to some other symbols which have been the prototypes of the characters. It is taken from the alphabet of Akerblad, but is considerably modified by the conjectures which have been published in the *Museum Criticum*.[1] M. Champollion pretends that his labours on the demotic text of the Rosetta inscription had also led him to increase, and in certain points to rectify, the alphabet of Mr Akerblad; and that the comparison of the hieratic manuscripts with a large hieroglyphical papyrus had enabled him to ascertain that the hieratic was a simple tachygraphy of the hieroglyphic writing. In this last point, however, he seems to have been anticipated by Tyschen of Göttingen, who, as early as the year 1816, announced to the world, in the *Magasin Encyclopédique*, that the hieratic was merely an abridged or simplified form of the hieroglyphical method of writing.

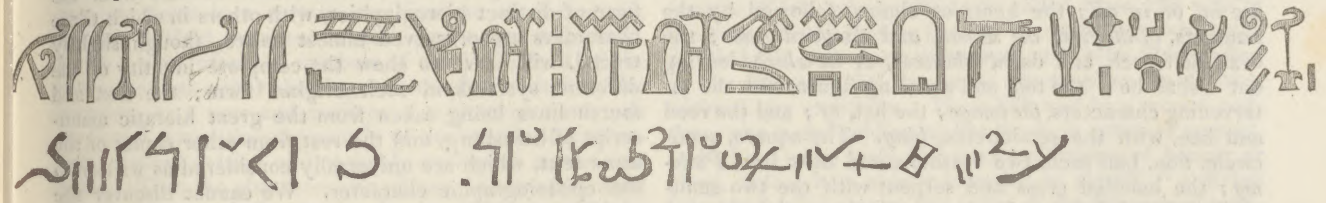
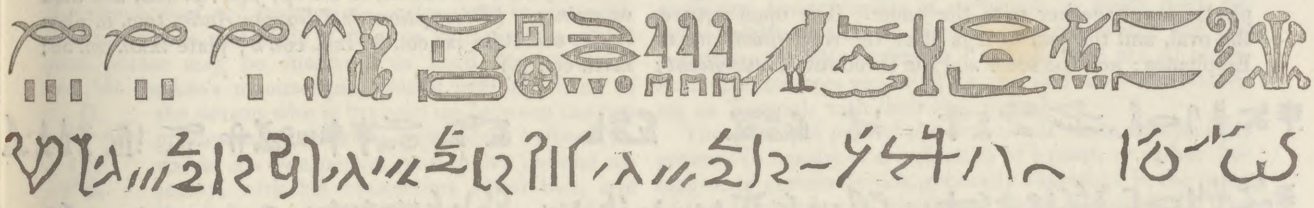
11. *Specimens of Phrases.*

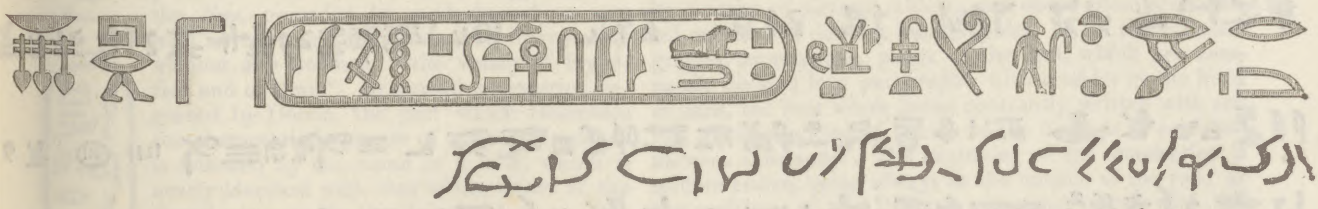
The last line of the inscription of Rosetta will serve as a specimen of the way in which the hieroglyphical characters were combined, so as to form a language; and will show at the same time the relation between the sacred and the enchorial texts.



. . . . ΣΤΕΡΕΟΥΛΙΘΟΥΤΟΙΣΤΕΙΕΡΟΙΣΚΑΙΕΓΧΩΡΙΟΙΣΚΑΙΕΛΛΗΝΙΚΟΙΣΓΡΑΜΜΑΣΙΝ



ΚΑΙΣΤΗΣΑΙΕΝΕΚΑΣΤΩΙΤΩΝΤΕΠΡΩΤΩΝΚΑΙΔΕΥΤΕΡΩΝ . . . .



At the beginning of the line we find some obscurity, and a want of perfect correspondence in the two inscriptions; but it is clear that the fork or ladder, the arm and the feathers, mean to *prepare* or procure; then follows *a column*; the wavy line, *of;* the semicircle and two dashes, with the arm, probably *strong* or hard; the block or square below, with its semicircle, *stone;* the loop or knot *wrought* or *engraven;* the half arch *in* or *with;* the instrument or case, *writing*, or letters; the wavy line, the hatchet, and drop, with the three dashes making a plural, *appropriate*

---

[1] We republish this Supposed Enchorial Alphabet, as it originally appeared in the article EGYPT contained in the *Supplement* to the former editions of the *Encyclopædia Britannica*, notwithstanding one comparatively more perfect might have been copied from the *Rudiments of an Egyptian Dictionary in the ancient Enchorial Character*, a work completed by Dr Young during the progress and under the pressure of his last illness. But we confess we were anxious to preserve unaltered this astonishing effort of learning and sagacity, to show precisely what had been achieved by the first successful labourer in the obscure domain of Egyptian literature, and to draw a marked line of distinction between the discoveries of Dr Young, and the additions or improvements subsequently made by Champollion and others. In the general alphabet, subjoined to this article, will be found all the phonetic hieroglyphics which have as yet been determined with any degree of certainty. But for an alphabetical classification of all the enchorial symbols or groups which have been ascertained, either by Dr Young himself, or by others who were induced by his example to pursue the investigation which he so ably commenced, we must refer the reader to the interesting work above cited, containing his last contribution towards the advancement of Egyptian literature.

Specimens.

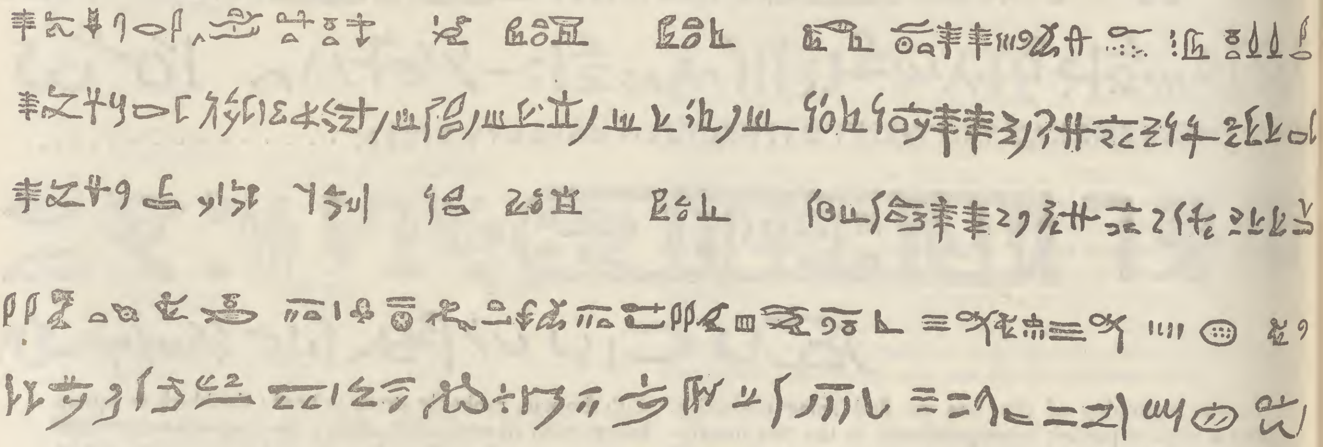
to the gods, that is, sacred ; the case again, *letters* ; the hat, *of* ; the ladder, arm, and feathers, *the country* ; the serpent and bent line, approaching to the sense of *perpetuity* and *greatness*, seem to be a mark of respect to the country, though it is barely possible that they may be substituted for the repetition of the instrument or case, and may mean the language, and belong to the following curve on the stem, the feathers, the serpent, and the hat, which signify *Greek*. The head-dress of flowers meaning probably a priest, the following curve with the dashes probably ornamental or honorary, or perhaps collective, and the two bowls, with the man in the plural, a publication ;— the whole of these symbols must express *the honorary decree of the priests, or the decree of the assembled priests* ; but the enchorial text seems to include the symbol for honour. The oval, with the semicircle and arm, implies *in order that*, or *in order to* ; the fork with cross bars, the arm, the legs, and the snake, *set it up* ; the bird, *in* ; the three broad feathers over as many open squares, *the temples*, as a plural ; the half arch and oval with the plural dashes, *all*, or *of all kinds* ; the open square, wheel, scale, head, dash, and ring, *Egypt* ; the figure with a vase on his head, *subjection* or *power* ; making the whole, belonging to Egypt, or *throughout Egypt*. The fork and dash are *in*, or *in all* ; the knots or chains, followed by the numbers, *of the first, the second, and the third order* ; the oval, half arch, and dash, *wherever*, or *in which*, leaving out " shall be ;" the tool and standing figure, with the intervening characters, *the image* ; the hat, *of* ; and the reed and bee, with the semicircles, *king*. The square, semicircle, lion, half arch, two feathers, and bent line, *Ptolemy* ; the handled cross and serpent with the two semicircles, *the everliving* ; the square block, semicircle, and chain, *dear to* ; the hieralpha and two feathers, *Phthah*, or Vulcan ; all this being included within the ring or phylactery, together with the name. The open square, the oval, and the pair of legs after the ring, *illustrious* or Epiphanes ; and the scale and the three lutes, *munificent* ; the conjunctions being often omitted, as they also are very commonly in Coptic, and even in Greek.

Comp son.

The enchorial text in many parts agrees extremely well with the hieroglyphics, according to the general style of imitation which has already been explained and exemplified, although in some passages there is a greater difference than might have been expected. The beginning of the enchorial line seems to contain the word *decree*, which cannot be found in this part of the hieroglyphics ; the character for letters occurs three times in it, as if the sacred character used in the third place meant *language* ; the sacerdotal decree of the sacred characters is omitted in the corresponding part of the enchorial ; the word *temples* is repeated before each numeral ; the term *wherever* is amplified ; the image is a very coarse imitation, and is followed by the character for a deity, meaning sacred or divine ; and, lastly, the name of Ptolemy is omitted, the word king being only followed by " whose life shall be for ever," or a phrase of similar import.

12. *Comparison of Manuscripts.*

The subjoined specimens of a comparison of the different manuscripts, which deviate more or less from the form of distinct hieroglyphics, with others in which those characters are preserved almost entire, though slightly traced, will serve to show the complete identity of the different systems in their original form ; the first and fourth lines being taken from the great hieratic manuscript of Strasburg, and the rest from other copies of the same text, which are universally considered as written in the epistolographic character. We cannot discover the entire connected sense of the whole passages, but we may easily observe the symbols for *gods, established, Osiris, Isis, Nephthe, Hieracion, to set up, four, priests*, and *child* or *prince*. (*Déscription de l'Egypte, Antiq.* tom. ii. plate lxxiv. col. 106 ; lx. col. 3 ; lxii. col. 2 ; plate lxxii. col. 38 ; lxvii. col. 2.)

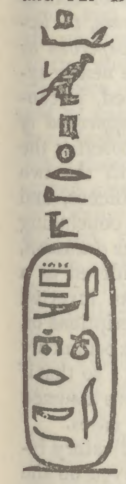


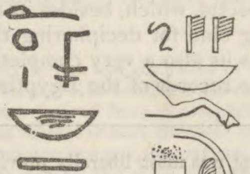
V. DR YOUNG'S OBSERVATIONS ON THE GENERAL CHARACTER OF THE EGYPTIAN MONUMENTS.

By means of the knowledge of the hieroglyphic characters which has already been obtained, we are fully competent to form a general idea of the nature of the inscriptions on the principal Egyptian monuments which are extant. Numerous as they are, there is scarcely one of them which we are not able to refer to the class either of sepulchral or of votive inscriptions ; astronomical and chronological there seem to be none, since the numerical characters, which have been perfectly ascertained, have not yet been found to occur in such a form as they necessarily must have assumed in the records of this description. Of an historical nature, we can only find the triumphal, which are often sufficiently distinguishable, but they also may always be referred to the votive; since whoever related his own exploits thought it wisest to attribute the glory of them to some deity, and whoever recorded those of another was generally disposed to intermix divine honours with his panegyric. It has, indeed, been asserted that the Egyptians were not in the habit of deifying any mortal persons ; but the inscription of Rosetta is by no means the only one in which the sovereigns of Egypt are inserted in the number of its deities. The custom is observable in monuments of a much earlier age ; indeed, in such a country it might be considered as a kind of dilemma of degradation, whether it was most ridiculous to be made a divinity, or to be excluded from so plebeian an assemblage ; but flattery is more prone to err

Monuments.

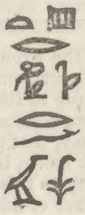
by commission than by omission, and consequently we find the terms *king* and *god* very generally inseparable. The sepulchral inscriptions, from the attention which was paid in Egypt to the obsequies of the dead, appear, upon the whole, to constitute the most considerable part of the Egyptian literature which remains; and they afford us, upon a comparative examination, some very remarkable peculiarities. The general tenor of all these inscriptions appears to be, as might have been expected from the testimony of Herodotus, the identification of the deceased with the god Osiris, and probably, if a female, with Isis; and the subject of the most usual representations seems to be the reception of this new personage by the principal deities, to whom he now stands in a relation expressed in the respective inscriptions; the honour of an apotheosis, reserved by the ancient Romans for emperors, and by the modern for saints, having been apparently extended by the old Egyptians to private individuals of all descriptions. It required an extensive comparison of these inscriptions to recognise their precise nature, since they seldom contain a name surrounded by a ring in its usual form. Sometimes, however, as on the green sarcophagus of the British Museum, a distinct name is very often repeated, and preceded by that of Osiris; whilst, in most other instances, there is a certain combination of characters, bearing evident relation to the personage delineated, which occurs, after the symbols of Osiris, instead of the name; so that either the ring was simply omitted on this occasion, or a new and perhaps a mysterious name was employed, consisting frequently of the appellations of several distinct deities, and probably analogous to the real name. That the characteristic phrase, so repeated, must have had some relation to the deceased, is proved by its scarcely ever being alike in any two monuments which have been compared; whilst almost every other part of the manuscripts and inscriptions is the same in many different instances, and some of them in almost all; and this same phrase may be observed, in Lord Mountnorris's and Mr Bankes's manuscripts, placed over the head of the person who is brought up between the two goddesses, to make his appearance before Osiris, in his own person, and in his judicial capacity, with his counsellors about him, and the balance of justice before him. (*Hieroglyphics*, 5 E F G e f.) In this instance the phrase consists of the names of *Hyperion* and the *Sun*, preceded by a block and an arm with an offering; and it may be interpreted, without any violence, "the votary of Hyperion and of Phré." In a small manuscript, engraved by Denon, the part which resembles the characteristic phrase of other manuscripts is followed by the name of a king, which is nearly identical with that of the father of the Pseudomemnon in the British Museum; the one having the hieralpha laid flat, the other the traces of the pedestal, which are equivalent to it.



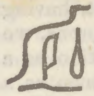


The tablet of the last judgment, which is so well illustrated by the testimony of Diodorus concerning the funerals of the Egyptians, is found near the end of almost all the manuscripts upon papyrus, which are so frequently discovered in the coffins of the mummies, and, amongst others, in Lord Mountnorris's hieratic manuscript, printed in the Collection of the Egyptian Society. The great deity sits on the left, holding the hook and the whip or fan; his name and titles are generally placed over him; but this part of the present manuscript is a little injured. Before him is a kind of mace, supporting something like the skin of a leopard; then a female Cerberus, and on a shelf over her head the tetrad of Termini, which have already been distinguished by the names Tetrarcha, Anubis, Macedo, and Hieracion, each having had his appropriate denomination written over his head. Behind the Cerberus stands Thoth, with his style and tablet, having just begun to write. Over his head, in two columns, we find his name and titles, including his designation as a scribe. The balance follows, with a little baboon as a kind of genius sitting on it. Under the beam stand Cteristes and Hyperion, who are employed in adjusting the equipoise; but their names in this manuscript are omitted. The five columns over the balance are only remarkable as containing, in this instance, the characteristic phrase, or the name of the deceased, intermixed with other characters. Beyond the balance stands a female, holding the sceptre of Isis, who seems to be called Rhea, the wife of the sun. She is looking back at the personage who holds up his hand as a mark of respect, and who is identified as the deceased by the name simply placed over him, without any exordium. He is followed by a second goddess, who is also holding up her hands in token of respect, and whose name looks like a personification of honour or glory, unless it is simply intended to signify "a divine priestess" belonging to the order of the Pterophori mentioned on the Rosetta monument. The forty-two assessors are wanting in this tablet; and, in many other manuscripts, their number is curtailed, to make room for other subjects; but, in several of those which are engraved in the *Déscription de l'Egypte*, they are all represented, sometimes as sitting figures, and sometimes standing as Termini, with their feet united.

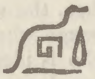
The principal part of the text of all these manuscripts appears to consist of a collection of hymns, or rather homages, to certain deities, generally expressed in the name of the deceased, with his title of Osiris, although the true Osiris is not excluded from the groups which are introduced. The upper part of each manuscript is occupied by a series of pictural tablets; and under them are vertical columns of distinct hieroglyphics, or, in the epistolographic manuscripts, pages of the text, which are commonly divided into paragraphs, with a tablet at the head of each, the first words being constantly written with red ink, made of a kind of ochre, as the black is of a carbonaceous substance. The beginning of the manuscript is seldom entire, being always at the outside of the roll; as the *umbilicus* of the Romans was synonymous with the end. Not far from the beginning, we always find a large tablet, occupying the whole depth of the paper, representing the sun adored by his ministering spirits. In the large hieratic manuscript, which occupies four plates of the *Déscription de l'Egypte*, and which may be considered as a fine specimen of the most highly finished copies, there are at present only four columns remaining before this tablet. It is followed by a short section, with a rubric, which is not very distinctly expressed; after this are thirty-five others, beginning with a long rubric, which is usually followed by the name of a divinity, represented in a neighbouring part of the margin, and which may be supposed to mean something like "Respect and reverence be paid to each of the sacred powers." The next ten sections begin with the rubric of a feather,

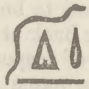


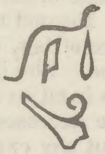
and a sitting figure raising his hand to his head, as if holding a vase on it, meaning probably "Honour is due," or belonging to; then follow the name and titles of Thoth or Hermes, and the phrase describing the deceased in the character of Osiris; and afterwards the names of each of a group of deities, which is represented in the corresponding tablet with an altar and a suppliant before them. These groups are different in the different sections, but they correspond pretty accurately with each other in the various manuscripts; and this hermetic decade is the most constant part of the manuscripts found with the mummies, though a little more extended in some than it is in others. (*Hieroglyphics*, 4.)



After these, we find thirty-five sections, beginning with a drop, a feather, a serpent, and a line; the rubric being immediately followed by the deified name peculiar to the manuscript. This exordium, from the analogy of the term sacred, we can have no hesitation in understanding as a derivative of the feather, signifying honour or ornament, and the serpent signifying perpetuity, and in translating it, "Eternal honour" or respect. A similar sense seems, in other places, to be expressed by the open square or the pyramid instead of the feather; and not uncommonly the hat is substituted for the line, without any variation of the meaning.



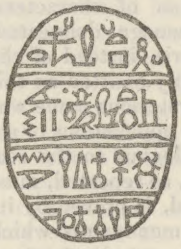




After these thirty-five sections, we have two others, of which the rubrics are less intelligible, followed by forty-two short ones, which evidently contain the names and titles of as many separate deities, whose figures are commonly represented in the great tablet, near that of Osiris. We may generally observe, amongst the epithets of each, the term *illustrious;* and each section has a second paragraph, beginning with a pair of arms extended, a character which seems occasionally to be used in reference to the equal scales of justice, though on the stone of Rosetta it appears to signify a kind of temple, so that it may possibly relate to the honours to be paid to these divine judges. With a few additional columns, and with the great tablet of the judgment, the manuscript concludes. It does not contain the figure of the sacred cow, which is the termination of most other manuscripts; nor the agricultural representations, which are frequently found in many of them, especially in that of Lord Mountnorris (*Hieroglyphics*, 3), with the three deities sitting in a grotto under it. The last of these, according to the inscriptions over the two boats, is meant for Arueris, the second apparently for the mother of the sun, and the first for Osiris; and one of the boats carries the steps, which seem to be emblematic of the solar power; the other, the throne or chair of state, which is universally appropriated to Osiris.

The coffins of the mummies, and the large sarcophagi of stone, are generally covered with representations extremely similar to some of those which are found in the manuscripts. The judicial tablet is frequently delineated on the middle of the coffins; above it are Isis and Nephthe at the sides, and in the middle apparently Rhea with outspread wings. The space below is chiefly occupied by figures of from twenty to thirty of the principal deities, to whom the deceased, in his mystical character, is doing homage; each of them being probably designated by the relationship in which he stands to the new representative of Osiris. In the sculptures, the figures are generally less numerous; the same deities are commonly represented as on the painted coffins, but without the repetition of the suppliant, and in an order subject to some little variation. The large sarcophagus of granite, in the British Museum, which was brought from Cairo, and formerly called the Lover's Fountain, has the name of Apis, as a part of the characteristic denomination. This circumstance, at first sight, seemed to make it evident that it must have been intended to contain the mummy of an Apis, for which its magnitude renders it well calculated; but when the symbols of other deities were found in the mystic names upon various other monuments, this inference could no longer be considered as absolutely conclusive.

Of the votive or dedicatory inscriptions, we find an interesting example on a small scale, in the engraving on the bottom of a scarabœus, very neatly sculptured in a softish steatite, or lapis ollaris, brought from Egypt by Mr Legh.



It is remarkable for its simplicity, and for affording an intelligible sense in all its parts. The chain, the semicircle, and the square block, mean clearly [*To*] *the beloved;* the loop supporting a wreath or crown, and the imperfect sitting figure, resemble some of the titles often given to Osiris, and, with the following oval, pretty certainly signify *of the great god;* the throne, the semicircle, and the oval, *Isis;* the sitting figure, *the goddess;* the looped wreath, perhaps *the great;* the bird and circle, *offspring of;* the hieralpha or plough, and the two feathers, *Phthah;* the pillar, perhaps *the powerful*, but it is not distinctly formed; the beetle seems to be here a synonym or epithet of Phthah, as if *the father of all;* the handled cross, *the living;* the lute, *the good;* the pyramid, *the prosperous* or glorious; the ring with the handle seems to be nearly synonymous with the chain, and may be rendered, in conjunction with the line and the hieralpha, *the approved of Phthah*, an epithet found in the inscription of Rosetta; the hatchet is *the deity;* the ring and handle, with the two lutes, approaches near to the symbol for munificent, and may be called *delighting in good gifts;* and the concluding ring and staff or hatchet may either mean, *this is dedicated*, or may, with rather more probability, be considered as a reduplication of the beginning of the line, in an inverted position. It may be remarked, that all the inscriptions on the scarabœi run from right to left, as is most commonly observed wherever the direction was indifferent; so that if they were used as seals, the impression must have assumed the form which is somewhat less usual in other cases.

We have a most valuable example of a dedicatory inscription on a larger scale in the decree preserved on the monument of Rosetta, which, besides its utility in affording the only existing clue for deciphering the hieroglyphical characters, gives us also a very complete idea of the general style of the records of the Egyptian hierarchy.[1] Of

---

[1] In another place, Dr Young, after remarking that the French expedition to Egypt was most liberally provided, by the government of the day, with a select body of antiquaries, architects, surveyors, naturalists, and draughtsmen, whose business it was to investigate all that was interesting to science or to literature in that singular country, and, further, that their labours have been made public with all the advantage of chalcographical and typographical elegance in the splendid collection entitled *Déscription de l'Egypte*, proceeds to observe: "But it is scarcely too much to say, that the only real benefit conferred on Egyptian literature by that expedition, was the discovery of a huge broken block of black stone, in digging for the foundations of Fort St Julian, near Rosetta, which the British army had afterwards the honour of bringing to this country as a proud trophy of their gallantry and success. It is not to a want of ability, nor of industry, nor of accuracy, nor of fidelity, in the Egyptian Commission, that so total a failure is to be at-

the triumphal monuments, the most magnificent are the obelisks, which are reported by Pliny to have been dedicated to the sun; and there is every reason to suppose that the translation of one of these inscriptions, preserved by Ammianus Marcellinus, after Hermapion, contains a true representation of a part of its contents, more especially as "the mighty Apollo" of Hermapion agrees completely with the hawk, the bull, and the arm, which usually occupy the beginning of each inscription. These symbols are generally followed by a number of pompous titles, not always very intimately connected with each other, and amongst them we often discover that of "Lord of the asp-bearing diadems," with some other epithets immediately preceding the name and parentage of the sovereign who is the principal subject of the inscription. The obelisk at Heliopolis is without the bull; and the whole inscription may be supposed to have signified something of this kind: "This Apollinean trophy is consecrated to the honour of King Ramesses, crowned with an asp-bearing diadem; it is consecrated to the honour of the son of Heron, the ornament of his country, beloved by Phthah, living for ever; it is consecrated to the honour of the revered and beneficent deity Ramesses, great in glory, superior to his enemies; by the decree of an assembly, to the powerful and flourishing, whose life shall be without end." It is true that some parts of this interpretation are in a great measure conjectural; but none of it is altogether arbitrary, or unsupported by some probable analogy; and the spirit and tenor of the inscription are probably unimpaired by the alterations which this approximation to the sense may unavoidably have introduced.

Of the obelisks still in existence, there are perhaps about thirty larger and smaller, which may be considered as genuine. Several others are decidedly spurious, having been chiefly sculptured at Rome in imitation of the Egyptian style, but so negligently and unskilfully as to exhibit a striking difference even in the character of the workmanship. Such are the Pamphilian, in explanation of which the laborious Kircher has published a folio volume, and the Barberinian or Veranian. In both of these the emblems are put together in a manner wholly arbitrary; and where an attempt is made to imitate the appearance of a name, the characters are completely different at each repetition. The Sallustian obelisk has also been broken, and joined inaccurately, and some modern restitutions have been very awkwardly introduced, as becomes evident upon comparing with each other the figures of Kircher and of Zoega. Another very celebrated monument, the Isiac table, which has been the subject of much profound discussion, and has given birth to many refined mythological speculations, is equally incapable of supporting a minute examination upon solid grounds; for the inscriptions neither bear any relation to the figures near which they are placed, nor form any connected sense of their own; and the whole is undoubtedly the work of a Roman sculptor, imitating only the general style and the separate delineations of the Egyptian tablets; as indeed some of the most learned and acute of our critical antiquaries had already asserted, notwithstanding the contrary opinions of several foreigners, of the highest reputation for their intimate acquaintance with the works of Greek and Roman art. We may hope, however, that in future these unprofitable discussions and disputes will become less and less frequent, and that our knowledge of the antiquities of Egypt will gain as much in the solidity and sufficiency of its evidence, as it may probably lose in its hypothetical symmetry and its imaginary extent; and whilst we allow every latitude to legitimate reasoning and cautious conjecture in the search after historical truth, we must peremptorily exclude from our investigations an attachment to fanciful systems and presupposed analogies on the one hand, and a too implicit deference to traditional authority on the other.

Manuscripts.

VI. FURTHER INVESTIGATIONS OF DR YOUNG; CASATI AND TURIN MANUSCRIPTS.

The Egyptian investigations of Dr Young had been as laborious as they were unremitting; but, at this stage, they had, in his own estimation, "been so little enlivened by any fortunate coincidences or unexpected facilities," that, having occasion to adopt a motto, he chose the words *Fortunam ex aliis* as appropriate to his own history. But the result showed that, in giving way to this fretful and complaining humour, he did injustice to fortune, which had in reserve for him a most "fortunate coincidence," the occurrence of which forms an epoch in the history of these investigations. We allude to the marvellous accident of the existence of a Greek manuscript, in perfect preservation, which, upon examination, proved to be a translation of an unique Egyptian manuscript, that had been purchased by the king of France. A little previous detail is necessary to put the reader in full possession of the facts.

In 1820 or 1821, an individual of the name of Casati arrived at Paris, bringing with him a parcel of Egyptian manuscripts, amongst which M. Champollion discovered one the preamble of which bore a considerable resemblance to the enchorial text of the Rosetta inscription. This observation naturally excited considerable interest, from its immediate connection with a subject which then engrossed the attention of the learned; and accordingly, Dr Young, having procured a transcript of the papyrus in question, immediately proceeded, with his accustomed ardour, to decipher and translate it. But whilst he was engaged in this difficult and laborious undertaking, in which, by his own unaided exertions, he had made considerable progress, Mr, afterwards Sir George Francis Grey, returned from his travels in the East, bringing with him several fine specimens of writing and drawing on papyrus, which he had purchased from an Arab at Thebes in January 1820. Fortunately for the cause of Egyptian literature, Mr Grey instantly put these manuscripts into the hands of Dr Young, at the same time calling his attention to two of them in particular, which were in a high state of preservation, and contained some Greek characters, apparently written in a pretty legible hand. Upon a closer inspection,

---

ributed; but partly to the real difficulty of the subject, and still more to the preconceived opinion, which was very generally entertained by their men of letters, of the exorbitant antiquity of the Egyptian works of art, which caused them to neglect the lights that might have been derived from a comparison of Greek and Roman inscriptions, with the hieroglyphics in their neighbourhood; and to suppose, that whatever bore the date of less than thirty or forty centuries, must necessarily be an interpolation, unconnected with the original architecture and decorations of the edifice to which it belonged." (*Account of some Recent Discoveries in Hieroglyphical Literature*, pp. 4, 5.) We shall hereafter find that this opinion was not confined to the members of the Egyptian Commission. Others have entertained the same extravagant notion of the antiquity of the Egyptian monuments, and, what has proved even more prejudicial, have lost sight of the important fact that, by the aid of translations alone, can we ever hope to attain the means of interpreting the inscriptions with which they are covered. It is only by pursuing analytical processes analogous to that of which Dr Young gave the first example,—by making repeated trials and comparisons with translations to guide and direct us,—by following the method of exhaustion, and at each step narrowing the limits of error,—that the truth will ultimately be attained, and a sure foundation be laid for constructing a system of interpretation alike certain in its principles and universal in its application.

however, it was found that one of these, being the *antigraph* of an Egyptian deed or conveyance, was altogether in Greek; whilst in the other, and in two more of the same kind, the *registry* was in Greek, and the *agreement*, or body of the deed, in the enchorial character.

Without losing a moment, Dr Young proceeded to examine that which was in Greek only, and, to his inexpressible surprise and delight, discovered that it was a translation of the enchorial manuscript of Casati. "I could scarcely believe," says he, "that I was awake, and in my sober senses, when I observed, among the names of the witnesses, *Antimachus*, *Antigenes*, and, a few lines further back, *Portis Apollonii*, although the last word could not have been deciphered without the assistance of the conjecture which immediately occurred to me, that this manuscript might perhaps be a translation of the enchorial manuscript of Casati. I found that its beginning was, *A Copy of an Egyptian Writing;* and I proceeded to ascertain that there were the same number of names intervening between the Greek and Egyptian signatures which I had identified, and that the same number followed the last of them; and the whole number of witnesses appeared to be sixteen in each. The last paragraph in the Greek began with the words, *Copy of the Registry;* for such must be the signification of the word ΠΤΩΜΑΤΟΣ employed in this papyrus, though it does not appear to occur anywhere else in a similar signification. I could not therefore but conclude, that a very extraordinary chance had brought into my possession a document, which was not very likely, in the first place, ever to have existed, still less to have been preserved uninjured, through a period of near two thousand years; but that this very extraordinary translation should have been brought safely to Europe, to England, and to me, at the very moment when it was most of all desirable to me to possess it, as the illustration of an original which I was then studying, but without any reasonable hope of being able fully to comprehend it—this combination would, in other times, have been considered as affording ample evidence of my having become an Egyptian sorcerer."[1]

But a still more extraordinary coincidence, connected with the revival of Egyptian literature, remains to be mentioned. Exclusively of the Greek antigraph, which relates to the sale of part of the offerings made from time to time on account of a certain number of mummies, Mr Grey's collection contained a second papyrus of considerably greater magnitude, upon which were engrossed three other deeds or conveyances, with separate registries upon the margin written in very legible Greek. In the hope of making some further progress in the study of Egyptian, Dr Young had resumed the examination of these enchorial conveyances, and, amongst other things, had observed the agreement of the numbers in the registries and in the Egyptian text; but whilst he was thus occupied, M. Peyron's account and translation of an Egyptian papyrus in the Royal Library at Turin made its appearance,[2] and proved to be the record of a law-suit, in which reference is made to three distinct title-deeds or conveyances. The following is an abstract of the contents of this singular instrument.[3]

The record begins with a date: "In the year LIV. the 22d of Athyr, at Diospolis. Before Heraclides, one of the captains of the body-guard, the commander of the Perithebaic nome, and chief officer of the customs; in the presence also of Polemo, a captain of the guard; Heraclides, of the same rank, and gymnasiarch; Apollonius, the son of Apollonius, and Hermogenes, his friends; Pancrates, a lieutenant; Comanus, a general, son of Ammonius a colonist, and several others; there appeared Hermias, the son of Ptolemy, of the Ombitic nome, as plaintiff, against the Cholchytæ[4] of the place, Horus, and Psenchonsis, and Chonapres, and their family." A memorial which had been addressed to Hermias, strategus, or commander-in-chief, and governor of the nome, was then read; in which the plaintiff, Hermias, accuses the Cholchytæ, and mentions a former memorial addressed to Demetrius, the epistrategus or high commander in the preceding year, and which had been referred by Hermias, the strategus, to the judgment of Heraclides. The cause having been pleaded by Philocles for Hermias, and by Dinon for the Cholchytæ, Heraclides summed up the evidence, discussed the arguments on both sides, and finally gave judgment for the defendants.

The claim of Hermias seems to have been founded on an alleged right of property, supported only by an admission on the part of Lobais or Lubais, one of the vendors of the house, that she had never had any right or title to the tenement in question. He had maintained in the memorial that his ancestors had held possessions in Diospolis during their lives respectively; that the defendants, whose proper habitation was confined to the Memnonia, where their ancestors had resided, knowing that he had been induced by the troubles of the times to change his residence, had seized upon his house, which was situated in the south-western part of Diospolis, to the north of the course or parade leading to the canal of the great goddess Juno, and to the south of the course leading to the temple of Ceres, the walls of which were left standing; that when they had repaired it they continued to occupy it, and, not content with simple occupation, they had received into it *dead bodies*, not considering the penalties to which they became liable from their proximity to the courses or parades of the great goddesses Juno and Ceres, which would be equally polluted by the corpses and those who had charge of them.

[1] See *Discoveries in Hierogl. Literature* (pp. 57, 58), where the reader will find translations (pp. 69–83) of the Greek antigraph, of the Egyptian original of the Casati manuscript, and of the three other deeds of Mr Grey.

[2] *Memorie di Torino*, xxxi. 1826. Amadeus Peyron, the ingenious translator of this papyrus, is known to civilians as the learned editor of Fragments of the Theodosian Code, deciphered from a palimpsest or rescribed manuscript in the Athenæum of the Royal Library at Turin, and also as professor of oriental languages in the university of that place.

[3] This abstract is taken from Dr Young's *Letter to Count Pollon*, 1826.

[4] The *Cholchytæ* were probably so called "ab *involvendo* cadavere;" and hence the name is supposed by Dr Young to be a derivative of the Egyptian word DCHOLH or JOLH, *to dress*, *to put on*, or *to swathe*. M. Peyron indeed dissents from the opinion that they were "dressers," observing that "i Colchiti non sono piu *dressers*, sacri paratori delle divinità, come sospettò il Y." He confesses, however, that "etymon tamen acute vidit," and adds, that "dicti sunt ab *involvendo* cadavere," conformably to the Coptic etymology suggested by Dr Young. But the author of an *Essay on the Enchorial Language of Egypt*, published at Dublin, 1833, ridicules as groundless and absurd the etymology proposed by the English and approved by the Italian scholar. "The name of this profession, χοαχυτης," says he, "is not to be found in any Greek lexicon; it is, however, analogically formed, and conveys a clear meaning, 'the pourer out of libations.' Dr Young read the word χολχυτης, and supposed it to be derived from a Coptic word signifying 'to dress,' as if the mummies, *after* being buried, were every now and then taken up to be dressed. The mistake is a palpable one." We think it is, but only on the part of the Dublin critic. For, in the first place, if the name of this profession be not found in any Greek Lexicon, Dr Young and M. Peyron had surely as good a right to call it χολχυτης, as the writer in question had to call it χοαχυτης; secondly, the word read in the manuscripts is not χοαχυτης, but χολχυτης, and in such a matter their authority must certainly be preferred to a mere unsupported conjecture; thirdly, from the terms of the record contained in the Turin manuscript, it appears that it was the business of persons belonging to this profession, not to "pour out libations," but to "dress" or "swathe" dead bodies after these had been embalmed; and, lastly, although Egyptian mummies were unquestionably "dressed" or "swathed" *after* being *embalmed*, it is worse than ridiculous to allege that the existence of such a profession as that of the Colchytæ would imply that these "mummies, *after* being *buried*, were, every now and then, taken up to be *dressed*." If, then, "the Colchytæ have passed muster in many Reviews and Encyclopædias," it is probably because an ascertained reading, supported by collateral evidence, has been thought preferable to an "imaginary word" like χοαχυτης, which, though "analogically formed," would convey a meaning inconsistent with the truth.

The Cholchytæ, on the other hand, alleged, first, that Hermias had already been nonsuited in a similar action brought on the same grounds; and, secondly, that they had been in possession of the house for many generations, an averment in support of which they produced their *Egyptian title-deeds* translated into Greek. *One* of these was dated in the month of Pachon, the xxviiith of Philometor, in which Teephibis, the father of Psenchonsis, one of the defendants, and of Chonopres, bought of Elecis and Lobais, and Ibæais, and Senerieus, and Erieus, and Senosorphibis, and Sisois otherwise called Erieus (in all seven vendors), $7\frac{1}{2}$ oikopedic or house cubits of the southern part of "ten cubits" of unproductive ground which they possessed. By the *second* deed, Asos, the father of the defendants Nechutes and Asos, and a younger Nechutes, and their sister Nechuthis, bought of the same persons $2\frac{1}{2}$ cubits in the same year and month. A *third* deed, of the xxxvth year of the same Philometor, and in the month Mesore, attests the sale of a fourth part of the said house, being $3\frac{1}{2}$ cubits, to Pechytes, the father of the others, Panas, and Patus, and Pasemis, and Arpchemis, and Senamunis, by Ammonius and Zbendetis, to whom it belonged. The duties on these transactions had also been paid into the office for the purchase of the tribute; and the parties had held undisturbed possession for thirty-seven years. Some passages of the Benevolent Edict are also cited, in which it is provided that such persons as have for a length of time been in possession of property shall be continued therein even though they be unable to produce the titles by which it was originally acquired. It was added by Dinon, on the part of the defendants, that, since the plaintiff's father left Diospolis at the time of the troubles under Epiphanes, his departure must have taken place eighty-eight years[1] before the institution of the suit; that this period was much too remote to allow of the present controversy; that Hermias had produced no document in support of his claim, except a fraudulent decree obtained in collusion with Lobais, who had no interest in defending the action; that with respect to the removal of the embalmers to the Memnonia, the subject was wholly foreign to the question, as Horus and his colleagues were not embalmers, but dressers (*Cholchytæ*); that, on popular festivals and other sacred days, it was their business to bring sand or ashes, and to strew therewith the temple of Ammon and that of Juno; and that, besides, in the annual processions, when Ammon passes over to the Memnonia, it was their privilege to be the leaders of the ceremony, to act as Cholchytæ, and to be rewarded accordingly.

Such is an abstract of this extraordinary document, which, besides its general interest, embodies the most curious details illustrative of the notions entertained respecting property, and also of the mode in which justice was administered, amongst the Egyptians. But the most remarkable circumstance connected with it yet remains to be mentioned. For, if the reader turn to the *three* conveyances of Sir George Grey, as translated by Dr Young,[2] he will find, to his astonishment, that *they* are the actual title-deeds founded on in the abridgment of the record which we have here placed before him. M. Peyron, indeed, has only identified *two* of them, the purchasers mentioned in the registry of the *third* being Ammonius and Psenamunis instead of Ammonius and Zbendetis or Zthenaëtis; but it is probable that Zbendetis or Zthenaëtis had two names, as well as Sisois or Spois, who is also called Erieus; for the date of the deed coincides perfectly with the record, and the same thing may be said of all the rest of the names, as well as the measures, in which there is the most entire agreement. It would almost seem, therefore, that the age of miracles has not yet passed away. Whilst Dr Young was occupied in studying the enchorial papyrus of Casati, the Greek manuscript of Sir George Grey, being the antigraph of an Egyptian deed, arrived as if by conjuration, and proved to be a translation of the document before him; and, next, when the same learned and ingenious person had been accidentally led to resume consideration of the Egyptian deeds of Sir George Grey, the record of a lawsuit founded upon, and expressly referring to, these very deeds, arrived unexpectedly from Turin, and afforded a precise confirmation of the date which, from the Egyptian text, he had previously assigned to the *first* deed, together with an exact description of the precise spots of ground to which all the three conveyances relate. Here, then, we have a series of "fortunate coincidences," such as have seldom concurred in confirmation of a new discovery, and which, happening at the propitious instant of time, when their great importance could not fail to be at once perceived, contributed materially, not only to establish what had been previously done, but also to facilitate the prosecution of future researches in the same field of inquiry.

Champollion, &c.

VII. INVESTIGATIONS AND DISCOVERIES OF CHAMPOLLION AND OTHERS.

Although for a number of years it has been the custom to speak with enthusiasm of the discovery of the phonetic alphabet made by M. Champollion, few persons appear to have a distinct idea, either of what it really is, or of the results which have been obtained by means of it. That Dr Young was the original author of this discovery has already been shown in the preceding sections, and may be proved, independently of all that has yet been stated, by evidence of the most incontrovertible kind. As early as the year 1818, he had ascertained the alphabetical value of the greater part of the hieroglyphical signs which compose the names of *Ptolemy* and *Berenice*, amongst which he had very exactly determined seven corresponding with the results obtained by M. Champollion, viz. the phonetic signs of B, F, I, M, N, P, and T. But although the determination of these seven letters must be regarded as the basis on which M. Champollion founded his phonetic alphabet, the sagacity of the English scholar, signally displayed in the discovery itself, did not foresee the consequences to which it might lead; and it was reserved for his French competitor to reap the glory which justly attaches to the development and illustration of a principle, fertile in results of the very highest interest and importance. Dr Young had adopted the notion that the characters employed by the Egyptians were essentially ideographic or symbolical, and were only used *phonetically* in representing *foreign* combinations of sound; but this idea, though it led him to neglect the prosecution of his own discovery, did not prevent him from laying the foundation of the hieroglyphico-phonetic alphabet, afterwards improved and extended by M. Champollion, and from presenting an enchorial alphabet comparatively so complete that but few additions of any importance have since been made to it by his successors. In short, to use the words of Mr Salt, Dr Young seems to us to stand alone with regard to the progress made by him in the enchorial, as well as for having led the way to the true knowledge of hieroglyphics.[1]

---

[1] This is chronologically exact; for, adding to the 24 years of Epiphanes, 35 of Philometor, and 29 of Euergetes, we have the precise number stated in the text. Thus, Epiphanes 24, Philometor 35, Euergetes 29; in all 88.

[2] *Discoveries in Hieroglyphical Literature*, pp. 76–83.

A considerable time previous to the date of this discovery, however, M. Champollion had applied himself to the interpretation of hieroglyphics; indeed, from the period of his quitting the Lyceum, he had begun to devote himself with ardour to this study. Jablonski, Zoega, and the authors of the *Déscription de l'Egypte*, then exercised a sort of dominion over the different branches of Egyptian antiquities. The mythology of Egypt was exclusively explained by relative passages in the ancient writers, and vain theories, which could never lead to any positive results, were applied to the hieroglyphical inscriptions. M. Champollion devoted himself entirely to the examination and study of every monument of this kind to which he could obtain access. Of these he made numerous copies, and, as it were, engraved on his memory all that he could find either in public or private collections; he also exercised himself in reproducing texts from recollection, and in this acquired astonishing dexterity. But, during many long years, the hieroglyphical inscriptions remained as great a mystery to him as to the rest of the learned. He pored over them without intermission, and he attempted a hundred systems of interpretation; but the time had not yet arrived when the secret of ancient Egypt was to be revealed. Nevertheless, more accurate notions as to the true nature of hieroglyphical writing had already begun to be entertained.

Zoega had suspected that several of the hieroglyphics might have been employed as *signs of sounds*, and for that reason he had denominated them *phonetic*. This conjecture, however, had at first made no impression upon those persons who were occupied with the study of the ancient Egyptian writings. On the contrary, in all their labours they followed the ancient system, regarding the mass of the hieroglyphics as composed of ideographic or symbolic signs; nor was it until some time after the discovery of the Rosetta inscription that the *only method* by which the Egyptians could possibly have expressed either foreign or national proper names, that is, by means of phonetic signs, forced itself on the attention of the learned. In this inscription everybody at once recognised the position of the name of *Ptolemy*, when Dr Young had, by a happy artifice of collocation, pointed it out; and on other monuments the ovals or scrolls containing the names of *Berenice* and *Arsinoe*, as well as those of several kings belonging to the old Egyptian dynasties, were likewise indicated with tolerable certainty. At this period, the current or enchorial writing engaged the attention of several learned and ingenious men, such as Baron de Sacy and Mr Akerblad in France, and Dr Young in England, and considerable progress was made, particularly by the latter, not only in determining the equivalents of groups, but even in ascertaining the values of individual characters. M. Champollion, however, continued to labour in a different direction, the idea that the hieroglyphics might contain a portion of characters purely alphabetical not having taken root in his mind. This is established beyond dispute by a passage in his work entitled *De l'Ecriture Hiératique des Anciens Egyptiens*, published at Grenoble in 1821, little more than a year before the appearance of his *Lettre à M. Dacier*. In this production, after stating that "long study, and, above all, an attentive comparison of the *hieroglyphic* texts with those of the second order, regarded as *alphabetical*, had conducted him to a contrary conclusion," he proceeds to lay down the following general principles, viz. 1*st*, That the writing of the Egyptian manuscripts of the second order is *not* alphabetical; 2*dly*, That this second system is only a simple modification of the hieroglyphical system, from which it differs merely in the form of the signs; 3*dly*, That this second species of writing is the *hieratic* of the Greek authors, and may be regarded as a hieroglyphic tachygraphy, or abbreviated mode of writing; 4*thly*, That the hieratic characters, and consequently those also from which they are derived, namely, the *hieroglyphic*, are signs of *things*, and not signs of *sounds* (" sont des signes de *choses*, et non des signes de *sons*"). It follows, then, that in 1821, M. Champollion did not believe in the existence of alphabetical signs amongst the hieroglyphics; although Dr Young had communicated his discovery to the learned of Europe in a memoir printed in 1818, and incorporated it in the article EGYPT, published the following year in the Supplement to the former editions of the present work, and although the ingenious conjecture of Zoega had been partially verified both by M. de Sacy and by Mr Akerblad.[2]

---

[1] *Essay on the Phonetic System of Hieroglyphics*, p. 1, note. London, 1825, in 8vo.

[2] Klaproth, *Examen Critique des Travaux de feu M. Champollion sur les Hiéroglyphes*, p. 3, et seqq. In the preface to the French translation of two articles on Hieroglyphics, which appeared in the *Edinburgh Review* (vol. xlv. pp. 96 and 528), some curious particulars are mentioned respecting the treatise *De l'Ecriture Hiératique des Anciens Egyptiens*, referred to in the text. This little work, which is in folio, has now become extremely scarce. " L'auteur a fait tout son possible pour soustraire cet ouvrage aux yeux du public, en retirant du commerce et des mains de ses amis le peu d'exemplaires qu'il avoit d'abord répandus. La raison qu'on a mise en avant étoit, ' *la crainte de blesser les scrupules de quelques personnes pieuses ;*' mais il ne se trouve dans le livre absolument rien qui ait trait à la haute antiquité de l'empire des Pharaons, et il est permis de penser que le véritable motif qui a determiné M. Champollion à supprimer ce livre, a été de ne pas donner une mésure trop précise des progrès qu'il avait fait jusqu'en 1821, un an avant sa fameuse *Lettre à M. Dacier*. Cette mésure existe dans l'assertion ' *que les signes hiéroglyphes sont des signes de* CHOSES, *et non des signes de* SONS.' Certes, celui qui, depuis dix ans, avoit travaillé sur les hiéroglyphes sans les déchiffrer, et qui faisoit, en 1821, imprimer un axiome pareil, avoit grand besoin d'être guidé dans ses nouvelles recherches de 1822, par les découvertes de M. Young, publiées en 1819, dans le *Supplement de l'Encyclopédie Britannique*. On ne doit donc plus douter, que la prétendue découverte de M. Champollion ne soit entée sur celle du Docteur Young, auquel appartient le mérite d'avoir le premier démontré qu'on s'est servi, en Egypte, de signes hiéroglyphes pour exprimer alphabétiquement les sons des noms propres. Disputér à ce savant la priorité de cette découverte, seroit aussi absurde que de vouloir soutenir, que celui qui le premier mêla du salpêtre avec du soufre et du charbon, n'a pas été l'inventeur de la poudre, mais bien celui qui s'est servi pour la première fois de ce mélange comme moteur pour les projectiles." (*Aperçus sur les Hiéroglyphes d'Egypte, et les Progrès faits jusqu'à présent dans leur Déchiffrement*, par M. Browne, Paris, 1827, in 8vo.) The disingenuousness and want of fairness which marked the commencement of M. Champollion's career as a claimant for the honour of discovery continued to distinguish it throughout. Of this we have an instance connected with the subject now under consideration. A pretended translation of the first of the two articles on hieroglyphical literature, which appeared in the *Edinburgh Review*, was inserted in the 22d number of the *Revue Britannique* (April 1827), then published at Paris. This translation, which was generally attributed to M. Champollion, scarcely represents the half of the original, although it is passed off on the public as complete. Several important passages are expunged, especially from the historical part of the article; others are altered so as to suit the views of the translator; and notes are added which clearly indicate the source whence they emanated. " Ces suppressions et ces additions, *n'ont evidemment d'autre but, que de faire prendre le change* au plus grand nombre des lecteurs, *sur la nature et le véritable importance de cet article,*

Champollion, &c.

It is no doubt true that M. Champollion afterwards attempted to give currency to a different story, and to lay claim to the merit of independent discovery. Having, on a frivolous pretence, endeavoured to suppress the work to which we just referred, by calling in all the copies in the hands of the booksellers, "de ne pas donner une mésure trop précise des progrès qu'il avait fait jusqu'en 1821," he ventured to assert that, without having any knowledge of the opinions of Dr Young, he had, about the same period, arrived at very nearly similar results. "Je dois dire," says he, "qu' *à la même epoque*, et *sans avoir aucune connaissance des opinions de M. le docteur Young, je croyais être parvenu*, d'une manière assez sûre, *à des résultats à-peu-près semblables*."[1] But there are several circumstances which render it impossible to give credit to this statement. In the first place, it is wholly irreconcilable with the doctrine laid down in his work on the Hieratic Writing of the ancient Egyptians, published in 1821, in which it is formally stated that both the hieratic and hieroglyphic characters are signs of *things*, and *not* signs of *sounds*. Secondly, it is contradicted by the direct testimony of Dr Young. "At the beginning of my Egyptian researches," says he, "I had accidentally received a letter from Mr Champollion, which accompanied a copy of his work on the state of Egypt under the Pharaohs, sent as a present to the Royal Society; and *as he requested some particular information respecting several parts of the enchorial inscription of Rosetta*, which were imperfectly represented in the engraved copies, I readily answered his inquiries, from a reference to the original monument in the British Museum, and a short time afterwards *sent him a copy of my conjectural translation of the inscriptions*, as it was inserted in the *Archæologia*." Dr Young then adds, that with regard to the enchorial inscription, M. Champollion appeared to him to have at that time done but little, and that the few references he made to it seemed to depend entirely on the investigations of Mr Akerblad, whose conclusions he had *tacitly* adopted. It is not easy to imagine how M. Champollion, with the knowledge of these facts in his mind, could venture to affirm that he had commenced his hieroglyphical researches at the same time with Dr Young; and that, without any knowledge of the opinions of the latter, he had arrived at nearly the same results. Thirdly, it is evident from the respective dates of M. Champollion's publications, that nearly six years must have elapsed between the date of the above communication and that of his *Lettre à M. Dacier;* and it also appears, that when Dr Young published his "conjectural translation" in 1815, M. Champollion had done nothing beyond tacitly adopting the conclusions of Mr Akerblad. The priority of publication cannot, therefore, be disputed. But as M. Champollion has not contradicted the statement of Dr Young regarding the communication above mentioned, and as it is undeniable that he saw the article EGYPT nearly two years before he published his *Lettre à M. Dacier*, containing the first statement of his discoveries in hieroglyphics, it is evident that he was in the full knowledge of Dr Young's "opinions" at every stage of his progress, and that the question of *originality* may be as easily settled as that of priority of publication. A sense of justice alone compels us to make these remarks, impeaching, as they do, the literary honesty of M. Champollion; and although it may appear an ungracious office, now that he is no more, to detract from his fame, yet flattery as well as obloquy should be silent over his grave. The merits of Champollion will not be the less fully appreciated if they are fairly estimated: it is exaggeration alone that can inflict any permanent injury on his reputation.

We have seen that, in 1821, M. Champollion did not believe in the existence of alphabetic signs amongst the hieroglyphics, although Dr Young had published his discovery nearly three years before. At this period, however, Mr Bankes made known a Greek inscription which he had discovered upon an obelisk in the island of Philae, and which mentioned the erection of a monument in honour of King Ptolemy. The discovery of the English traveller attracted the attention of scholars, and M. Letronne, in some learned observations on the text of the inscription, stated it as his opinion that the monument in question would be found to contain, in hieroglyphical characters, the same sense as the Greek inscription, or, in other words, that the one would prove to be a version of the other. Mr Bankes, having learned the opinion expressed by this distinguished scholar, and being anxious to afford every means in his power for verifying its accuracy, transmitted to the Academy of Inscriptions, in the month of January 1822, a lithographed copy of the hieroglyphics covering the four faces of the obelisk of Philae, upon the base of which he had discovered the Greek inscription already mentioned. And it was this lithograph which, having been communicated to M. Champollion, enabled him to make those observations and comparisons the results of which he published in his *Lettre à M. Dacier*, dated the 22d of September 1822. Then, indeed, but not before, did he recognise the name of *Cleopatra*, and the use of alphabetical characters amongst the hieroglyphics; then only it was that he abandoned the notions which he had hitherto entertained respecting the nature of the Egyptian writing, and which, as already shown, had at first led him to reject the discoveries of Dr Young.[2]

Having entered upon this new career, M. Champollion pushed on with irrepressible boldness, and devoted himself with more ardour than ever to the study of the Egyptian monuments. He applied his alphabet to deciphering the names of the Roman emperors and those of the Greek and Egyptian kings; and finding his observations not only multiply, but likewise extend to objects which had not been touched on in his *Lettre à M. Dacier*, he embodied the results, modified in some points and verified in others, into a more extended work, which appeared at Paris in 1824, under the title of *Précis du Système Hiéroglyphique des Anciens Egyptiens.* We must, however, guard the reader against the misconception which this title is calculated to produce respecting the extent and results of M. Champollion's labours. From it he may perhaps expect to find the exposition of a "system," and a summary of the principles by means of which the hieroglyphic texts can be read and interpreted; whilst, in reality, the book only contains a more ample and extensive application of the ideas explained in the *Lettre à M. Dacier.* It embraces a great number of proper names belonging to persons of all ranks, accompanied with observations and conjectures as to the meaning of certain concomitant signs, to which the author attributes a grammatical value, but without having sufficiently established the point by induction. This, however, did not prevent him from proceeding to generalise; and,

---

et d'accrediter davantage les erreurs répandues en France sur les premières tentatives faites pour déchiffrer les hiéroglyphes Egyptiens." (*Aperçus sur les Hiéroglyphes*, pref. p. viii.) But by this unceremonious and dishonest proceeding the translator overshot his mark. The garbled and mutilated translation was soon followed by one of the principal article, "rétabli dans son integrité," and the claims of Dr Young were thus brought fully and fairly before the literary public of France.

[1] *Précis du Système Hiéroglyphique des Anciens Egyptiens*, p. 18. Paris, 1828, in 8vo, 2d edition.

[2] Nevertheless he appears to have been of opinion at this period, that the employment of alphabetical characters was confined to the transcription of Greek and Roman proper names, and that the greater part of the other hieroglyphics were ideographic; one more proof how closely he had followed the footsteps of Dr Young.

as he had formerly maintained that the greater part, if not the whole, of the hieroglyphic texts were ideographic, so now he passed to the opposite extreme, and concluded that alphabetical signs predominated in the monumental inscriptions, all of which might, in a great measure, be interpreted by means of the phonetic method. Such a conclusion, if it had been sufficiently established, would no doubt have proved of the highest importance; but, instead of applying his new system to the inscription of Rosetta, of which the import was known from the accompanying Greek version, or to other texts of still more considerable extent, M. Champollion confined himself to the interpretation of detached phrases, which of themselves were not sufficient to establish the certainty of his system; and hence his work, important and interesting as it unquestionably is, has still left much to be desired by the friends of archæological science.

But although the ardour of his mind had, at first, hurried him away, M. Champollion appears soon to have become sensible that he had advanced too rapidly; indeed he could not but feel an urgent necessity for augmenting the mass of materials at his disposal, and multiplying more and more the points of comparison indispensable to the progress of his studies. Accordingly he undertook a journey to Italy to explore the treasures contained in the rich collections of that country, and spent much time in the museum of Turin, then recently enriched with the noble collection of Drovetti, containing a great number of papyri, pillars, and inscriptions of every kind. From this museum were written the *Lettres* addressed to the Duc de Blacas, in which the author began to make more numerous applications of his system, particularly to all that concerned the ancient Egyptian dynasties; and he even hazarded more extensive interpretations, comprehending not only simple proper names, but names preceded or followed by titles, or by certain portions of phrases. These readings, however, were not accompanied with the requisite explanatory details, which alone could give them authority; and, with reference to the Egyptian system of writing, the *Lettres à M. de Blacas* seem not to have produced any change of importance in the theory of the author. When, on his return from Italy, he published a second edition of his *Précis du Système Hiéroglyphique*, Paris, 1828, he accordingly introduced but few modifications of the statements contained in the first, and saw no reason to alter the opinion which he had therein expressed as to the phonetic value of the great mass of the hieroglyphics. On the contrary, he formally repeated his fundamental proposition, "That the figurative and symbolical characters are employed in the Egyptian texts in a smaller proportion than the phonetic characters; that the latter are the true alphabetical signs which express the sounds of words in the spoken language of ancient Egypt; and that every phonetic hieroglyph is the image of a physical object, the name of which, in the spoken language of Egypt, commenced with the sound or articulation which the sign itself is employed to express."

Such were the general views entertained by M. Champollion before setting out for Egypt with the intention of examining the monuments themselves, and of seeking on the spot the confirmation of his discoveries. In his *Panthéon Egyptien*, the publication of which commenced in 1824, he had given representations of the Egyptian divinities, accompanied with hieroglyphic legends, to which explanatory notices were subjoined; and he had made frequent use of notions borrowed from the Greek and the Latin authors, and already classed in the Egyptian Pantheon of Jablonski. Yet he laid it down as a principle, "que c'était de préférence dans les monumens Egyptiens qu'il fallait chercher les noms d'une foule de divinités et de personages mythologiques, qu'on chercherait en vain dans les auteurs classiques;" a proposition which, according to Klaproth, is only admissible upon the supposition that we have already arrived at a complete intelligence of the graphic monuments of Egypt; and until such knowledge has been attained, no one has any right to found new theories on their alleged contents. The proposition, however, is admissible upon a much more limited supposition, namely, that we have attained the means of deciphering with tolerable certainty names, titles, and legends; and the result has accordingly been, that "the names of a crowd of divinities and mythological personages, which would be sought for in vain in the classical authors," have been ascertained by Wilkinson, Rosellini, Burton, Felix, and others, not to mention M. Champollion himself. We ought to add also, that, at the period of his departure for Egypt, M. Champollion held as demonstrated the existence of a considerable number of signs employed phonetically, that is, used to represent the sounds of the Egyptian language, each sign standing for the initial sound of the name of the physical or other object of which it was the image or picture;[1] and that, entertaining this view, he departed from the common opinion, which attached a symbolical value to the greater number of the hieroglyphics. Such being the doctrine maintained by him, we shall now proceed to place before the reader a short abstract of the investigations and discoveries of M. Champollion, reserving for the conclusion of this section some general observations and criticisms of his labours.

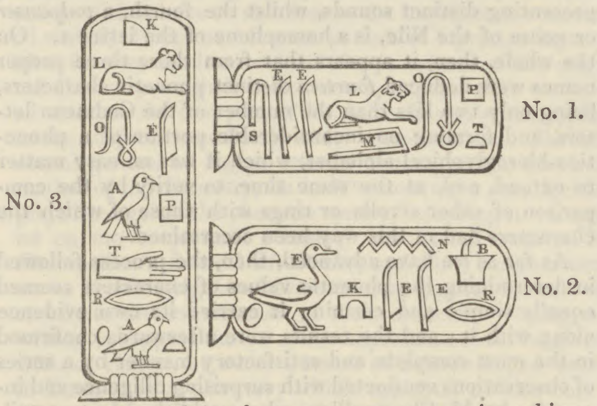
The conditions of the problem which M. Champollion undertook to resolve may be very briefly explained. Every body has seen Egyptian monuments, and every body knows in a general way the form and disposition of the characters called *hieroglyphics;* but few persons, perhaps, have reflected on the nature of these characters, and still fewer know wherein consists the real difficulty of interpreting them. The passages of ancient authors being for the most part vague and incoherent, afforded no explanation of this system of writing; even the celebrated text of Clemens Alexandrinus, so far from serving as a guide to direct inquiry, has only received an approximate interpretation by means of knowledge otherwise acquired of the subject to which it relates; and we cannot be absolutely certain that all the difficulties which this passage presents have as yet been overcome. But the main point for determination was, whether the hieroglyphics were destined to represent ideas *directly*, or by the *intervention of the sounds of the spoken language;* whether they were the symbols of *things*, or the signs of vocal articulations; whether, in short, they were to be considered as *ideographic* or as *phonetic*. In the one case, that is, supposing the signs ideographic, it must be evident that we could never hope, by any effort, to attain a complete intelligence of such characters; because, to attempt to divine the sense of ancient symbols is to expose ourselves at every step to fall into the very errors which now appear so ludicrous or extravagant in Pierius, Kircher, Palin, and Pluche. But, on the other hand, supposing the hieroglyphics were regarded as in a great measure composed of phonetic signs, the interpretation of these characters would, on such a supposition, be not only possible, but, under certain conditions and in certain circumstances, might be easy. This accordingly was the doctrine espoused by M. Champollion in its utmost latitude. The analysis given by Dr Young of the names of *Ptolemy* and *Berenice* had proved beyond dispute that these were expressed phonetically; but as it was not unreasonable to conclude that the method employed in representing graphically two proper names might be applied to all, or perhaps even extended to common words and phrases in the language, M. Champollion was led to conceive, that if an alphabet of phonetic characters could be constructed, it would probably furnish a key to hieroglyphical writing in general, and produce new and unexpected results of the utmost importance to history. The first and great object, therefore, was, if possible, to obtain an alphabet; and to the accomplishment of this M. Champollion primarily directed his attention.

---

[1] On a reconsideration of the subject, Dr Young regarded this notion as altogether fallacious. "Mr Champollion," says he, "has never been led, *in any one instance*, from the Egyptian name of an object, to infer the phonetic interpretation, that is, the alphabetical power of its symbol; but the letters having once been ascertained, he has ransacked his memory or his dictionary for some name that he thought capable of being applied to the symbol, and not always, as it appears to me, in the most natural manner. I should prefer, for instance, the word HPEPI, a *flower*, as making the R, to the name of *pomegranate*, which, it seems, was sometimes called ROMAN or ERMAN." (*Discoveries in Hieroglyphical Literature*, p. 48.)

But the task which he had to perform was, comparatively speaking, an easy one. Dr Young, as we have already seen, had not only demonstrated the practicability of constructing such an alphabet, but, by his analysis of the names *Ptolemy* and *Berenice*, he had assigned phonetic values to *nine* distinct characters, the greater number of which corresponded with the results which were afterwards obtained by M. Champollion. The first step had therefore been made, and it only required perseverance and good fortune to ensure success. We say "good fortune," because Dr Young had already done all that was possible with his materials. If the hieroglyphical inscription of Rosetta had come to Europe entire, a tolerably complete alphabet of phonetic hieroglyphics would in all probability have been formed before M. Champollion was heard of as a labourer in this interesting field of inquiry. But unfortunately the pillar contains only the last fourteen lines of the hieroglyphic text, and even these are so much mutilated, that the name of *Ptolemy*, enclosed in an oval or cartouche, is the only one of all those mentioned in the Greek text which has escaped destruction. This name is represented by eight hieroglyphic characters, one of them (the feather, E) being repeated; but, as the Greek name, ΠΤΟΛΕΜΑΙΟΣ, consists of *ten* letters, it was of course impossible, without further materials, to fix with certainty the relation between the seven or eight hieroglyphical signs and the ten letters of the Greek name. But the discovery of a new monument (and in this consisted M. Champollion's good fortune) at length removed all uncertainty in this respect, and led directly and easily to the formation of the alphabet required. The obelisk discovered by Mr Bankes in the island of Philae was found to contain the hieroglyphic name of one of the Ptolemies, expressed by the same characters which occur in the inscription of Rosetta, surrounded by a ring or border; and this was followed by a second ring or scroll which obviously contained the proper name of a woman, and a queen of the family of the Lagidæ, inasmuch as the group was terminated by the hieroglyphics expressive of the feminine gender, which had been previously determined by Dr Young. The obelisk in question was fixed on a basis or pedestal containing a Greek inscription, which proved to be a petition of the priests of Isis, addressed to King Ptolemy, to Cleopatra his sister, and to Cleopatra his wife. But if, as M. Letronne ingeniously conjectured, this obelisk, and the hieroglyphical inscription engraved upon it, were the result of this petition, which in fact adverts to the consecration of a monument of the kind, the border with the feminine proper name could only be that of one of the *Cleopatras* mentioned in the petition. This name, therefore, and that of *Ptolemy*, which in the Greek *have several letters in common*, were capable of being employed for a comparison of the hieroglyphical characters composing them; and if the similar characters in these names were found to express in both the same sounds, it would follow demonstratively that the nature of these characters must be entirely phonetic.

The course of investigation here indicated appears sufficiently simple and conclusive; but as the development of a hieroglyphical alphabet has been mainly effected by a comparison of the characters which enter respectively into the composition of the names *Ptolemy* and *Cleopatra*, we shall endeavour to exemplify the process by means of which the phonetic values of individual signs were determined.



This figure exhibits three proper names written hieroglyphically, each of them enclosed within an elliptical ring or cartouche, viz. the name of *Ptolemy*, No. 1, taken from the hieroglyphical branch of the triple inscription of Rosetta; that of *Berenice*, No. 2, copied from a ceiling of the great temple at Karnak; and that of *Cleopatra*, No. 3, as furnished by the obelisk of Philae. Of the first and second, viz. *Ptolemy* and *Berenice*, the reader has already seen Dr Young's analysis, deduced with singular ingenuity from the enchorial text of the Rosetta inscription. At present, however, we have only to do with the first and third, or with the names of *Ptolemy* and *Cleopatra*. And, on referring to the ovals or rings, Nos. 1 and 3, containing these names, the reader will at once perceive that, in the scroll of *Ptolemy*, ΠΤΟΛΜΗΣ, the fourth, sixth, third, and first characters are identical with the second, third, fourth, and fifth characters in the scroll of *Cleopatra*, and that these characters must therefore correspond respectively to the Greek letters Λ, E or H, O, and Π. Their relative positions remove all doubt as to their respective values; and the evidence afforded by this comparison is strengthened by the circumstance that, contrary to the common usage, the name of *Cleopatra* is spelled fully out, leaving none of the vowels to be supplied. Here, then, we have the values of four characters (the lion, the feather, the flower with the recurved stem, and the square) determined by a sort of *instantia crucis*, and at the same time a striking confirmation of the soundness of the original hypothesis, which, of course, becomes absolute certainty by the repetition of such comparisons. But the same process which enables us to ascertain the values of the characters *common* to both names, equally enables us to infer the values of those in which they *differ*. The name ΚΛΕΟΠΑΤΡΑ, for instance, is spelled hieroglyphically by *nine* phonetic characters or signs, together with the symbols (a semicircle and oval) of the feminine termination; in other words, there is a phonetic character corresponding to every letter in the Greek name. But *four* of these characters consecutively Λ, E, O, Π, have been determined by the direct method of comparison; and as the name is, by the supposition, known, it follows that the values of the remaining *five* may be inferred without almost the possibility of error. Having ascertained the values of the second, third, fourth, and fifth, we necessarily obtain, at the same instant, the true values of the first, sixth, seventh, eighth, and ninth. The same thing precisely is applicable to the name of *Ptolemy*. But as the name of *Cleopatra* contains *eight* distinct characters (one, the phonetic sign of A, being repeated), and as the name of *Ptolemy*, deducting the four letters which it has in common with that of Cleopatra, supplies *three* more, we thus obtain, from the analysis of these two names, *eleven* distinct characters representing as many distinct sounds; and if the same indirect method of comparison be applied to the name of *Berenice*, it will furnish other *four* signs, three of them representing distinct sounds, whilst the fourth, a *vulpanser* or goose of the Nile, is a homophone of the letter A. On the whole, then, it appears that from these three proper names were deduced *fourteen* distinct phonetic characters, being only two less than the number of the Cadmean letters, and forming no inconsiderable portion of a phonetico-hieroglyphical alphabet, which it was an easy matter to extend, and, at the same time, to verify by the comparison of other scrolls or rings with those of which the characters had in this way been ascertained.

As far as we have advanced, then, the process followed in determining the phonetic values of characters seemed equally simple and certain; it carried its own evidence along with it; and the results were afterwards confirmed in the most complete and satisfactory manner by a series of observations conducted with surprising diligence and ingenuity by M. Champollion, who established by unassailable evidence that all proper names were written alphabetically. But, not content with a mere induction of *facts*, the French archæologist attempted to discover the *principle* which regulated the phonetic application of certain characters or signs, and at length came to the conclusion that every *phonetic hieroglyphic* is the image of a physical object, the name of which, in the spoken language of Egypt, commenced with the *sound* or *articulation* which the sign itself is destined to represent. Thus, according to him, the image of an eagle, which, in Coptic, is *Ahôm* or *Achôm*, became the sign of A; that of a small vase or censer, in Coptic *Berbé*, a sign of B; that of a hand, *Tot*, a sign of T; that of a hatchet, *Kelebin*, a sign of K; that of a lion or lioness, *Labo* or *Laboi*, a sign of L; that of a nycticorax or owl, *Mouladj*, a sign of M; that of a flute, *Sebiandjo*, a sign of S; that of a mouth, *Rô*, a sign of R; the abridged image of a garden, *Schné*, a sign of SH; and so on. But this hypothesis, which reduces the phonetic hieroglyphics to a species of calembourgs, and leaves, in the greater part of the inscriptions, only a writing in *rebuses*, seems obnoxious to insuperable objections. In the first place, as Dr Young remarked, M. Champollion was never, in any one instance, led, from the Egyptian name of an object, to infer the phonetic interpretation or alphabetical power of its symbol; but the letters having been ascertained by other means, he ransacked his memory or his dictionary for some name which he thought capable of being applied to the symbol, though not always in the most natural manner. Secondly, as the same letter is represented by a diversity of characters, it would be necessary to show, which M. Champollion has not attempted to do, that all these homophonous characters are employed on the principle above enunciated, or, in other words, that every one of them is the image of a physical object, the name of which, in the spoken language of Egypt, began with the sound which the sign itself was intended to represent. Thirdly, the Coptic language, which was undoubtedly formed from that of ancient Egypt, of which it may in one sense be considered as a precious remnant, nevertheless represents the latter in a very incomplete and imperfect manner; many Coptic words are not Egyptian; many Egyptian words are no longer to be found in the Coptic; the latter, as it now exists, is merely a mutilated and imperfect fragment, through which some traces and lineaments of an elder form of speech are faintly reflected; and even with the Coptic, as we now have it, M. Champollion was but indifferently acquainted. It is obvious, therefore, that no reliance whatever can be placed on any theory connected with hieroglyphics which professes to depend exclusively upon Coptic, although, as in this instance, it be propounded with as much confidence as if the language of Egypt had descended unaltered from the days of Ramesses, or the author had possessed a glossary composed under the reign of Sesostris.

Having constructed a phonetico-hieroglyphic alphabet in the manner above described, M. Champollion proceeded to apply it in deciphering the proper names inscribed on the temples and other edifices of Egypt; and in his *Lettre à M. Dacier*, which is embodied in his larger work, he exhibited the results obtained from the inscriptions on the monuments of Denderah (*Tentyris*), Thebes, Esneh (*Latopolis*), Edfou (*Apollonopolis Magna*), Ombos, and Philae, relative to the Greek and Roman periods of the history of Egypt. Of these, however, we can only afford to give a very condensed abstract. And,

First, connected with the Greek period we read, 1. the name of *Alexander the Great*, which is sculptured twice on the edifices of Karnak, and written ΑΛΚΣΝΤΡΣ and ΑΛΚΣΝΤΡΕΣ. This name Dr Young had previously deciphered from the enchorial text of the Rosetta inscription.[1] 2. The name of *Ptolemy*, common to all the Lagidæ, or sovereigns of the Macedonian dynasty. It is commonly written ΠΤΟΛΜΗΣ, sometimes ΠΤΛΟΜΗΣ; it occurs in the hieroglyphic text of the Rosetta inscription, at Denderah, on the monolith of Kous, and on other monuments; it is preceded by the particular surnames of Ptolemy, and followed by one or other of the legends, *always living, beloved of Phtha; always living, beloved of Isis; always living, beloved of Phtha and of Isis*. 3. The name of *Berenice*, written ΒΡΝΗΚΣ, which occurs twice on the ceiling of the triumphal arch or gate on the south of Karnak. 4. The name of *Cleopatra*, written ΚΛΕΟΠΑΤΡΑ on the obelisk of Philae already mentioned, and ΚΛΑΟΠΑΤΡΑ and ΚΛΟΠΤΡΑ on the edifices of Ombos, Thebes, and Denderah. 5. The name of *Ptolemy* surnamed *Alexander*, and accompanied with the legend, *always living, beloved of Phtha*. The name is written ΠΤΟΛΜΗΣ, and this is separated from ΑΡΚΣΝΤΡΣ by a group corresponding to the Greek word ἐπικαλουμενος, *surnamed*. 6. The name of another *Ptolemy*, scarcely known in history, the son of Julius Cæsar by the same Cleopatra for whom Antony gave up the empire of the world. This boy, according to Plutarch, bore the name of *Cæsarion;* Dion Cassius calls him *Ptolemy-Cæsarion;* and his scroll, sculptured at Denderah, next to that of his mother, contains the name ΠΤΟΛΜΗΣ *surnamed* ΝΗΟΚΗΣΡΣ, *Ptolemy the young Cæsar*, followed by the ideographic symbols for *always living*, and the title *beloved of Isis* spelled phonetically.

Secondly, the phonetic alphabet was found to apply, without modification either in the values or the arrangement of the signs, to a much more numerous class of hieroglyphic names of sovereigns sculptured on the monuments of Egypt; we mean to those of the Roman emperors: But, contrary to all expectation, it was found that their titles, names, and surnames, on the bas-reliefs of the temples, were expressed in hieroglyphical characters, suggesting not Latin, but *Greek* words; a circumstance which seems to prove, what indeed is otherwise pretty well established, that latterly these sacred sculptures were executed by Greek workmen, or at least under the direction of Greek artists. Thus, connected with the Roman period, we read, 1. the imperial title Αυτοκϱατωϱ, spelled ΑΟΤΟΚΡΤΡ, ΑΟΤΚΡΤΟΡ, ΑΟΤΑΚΡΤΡ, and ΑΟΤΟΚΑΤΛ, "le Λ étant employé *baschmouriquement* pour le Ρ," according to M. Champollion. This title usually occupies an entire cartouche, and is followed by the ideographic symbols for *always living*. 2. The title of Καισαϱ or Καισαϱος, written indifferently ΚΗΣΡΣ or ΚΗΣΛΣ. It occupies an entire scroll, is followed by the epithets *always living*, *beloved of Isis*, and occurs on the edifices of Philae and of Denderah. 3. The legend ΑΟΤΚΡΤΡ ΚΗΣΡΣ, the *Emperor Cæsar*, *always living*, *beloved of Isis*, which, Champollion conceives, can only apply to Augustus, whose Greek medals struck in Egypt commonly contain only the two words of this legend which are spelled phonetically. It is repeated six times on the cornice of the posterior part of the western temple at Philae. 4. The name of the *Emperor Tiberius*, which occurs several times on the walls of the western temple at Philae. Two scrolls joined together contain the legend ΑΟΤΚΡΤΡ-ΤΒΡΗΣ-ΚΗΣΡΣ, the *Emperor Tiberius Cæsar*, *always living*. 5. The titles and name of *Domitian*, contained in conjoined scrolls, and written ΑΟΤΚΡΤΡ ΤΟΜΗΝΣ ΣΒΣΤΣ, the *Emperor Domitian Augustus*. This occurs on the monuments of Philae; but a more extensive legend of this emperor is found on the edifices of Denderah, where the hieroglyphic scrolls give the *Emperor Cæsar Domitian* surnamed *Germanicus*. 6. The name of the same emperor on the Pamphilian obelisk at Rome; but this monument, in explanation of which Kircher published a folio volume, is believed, on good grounds, to be spurious.

---

[1] See *Supplement* to the fifth and sixth editions of this work, vol. iv. plate lxxv.; also section iv. of this treatise.

The name of the *Emperor Trajan* occurs on the walls of the intercolumniation of the eastern edifice at Philae. The image of this good prince, presenting an offering to Isis and to *Arsiêsi* or *Hôrsiêsi*, Horus, the son of Isis, is accompanied by two cartouches or scrolls containing the words ΑΟΤΚΡΤΡ ΚΗΣΡΣ ΝΡΟ ΤΡΗΝΣ, the *Emperor Cæsar Nerva Trajan*; and the legend, *Trajan Cæsar*, *ever-living*, contained in a scroll, terminates the perpendicular column of hieroglyphics sculptured to the right of the bas-relief. The frize of the same intercolumniation is decorated with nine small scrolls. That of the centre, supported by two *uræi* or royal asps, contains the name of *Trajan*, ΤΡΗΝΣ, with the ideographic epithet *ever-living*; and, combined with the scroll on the right and that on the left, it produces the legend, *The Emperor always living*, *Trajan ever-living*, *Cæsar*, *eternal germ of Isis*. The three cartouches placed to the right of these last produce the words, *Trajan ever-living*, *Cæsar*, *Germanicus*, *Dacicus*, *always living*. And, lastly, the three cartouches on the left give the legend, *Nerva Trajan always living*, *Emperor Cæsar always living*, *Augustus ever-living beloved of Isis*. The name of Trajan is also read on the great temple of Ombos, where two scrolls found amidst the ruins of that monument form together the legend, ΑΟΤΟΚΡΤΡ ΚΗΣΡ ΝΡΟΑ ΤΡΗΝΣ ἐπικαλουμενος ΚΡΜΝΗΚΣ ΤΗΚΚΣ, *The Emperor Cæsar Nerva Trajan*, *surnamed Germanicus*, *Dacicus*; which is, word for word, the legend of the Greek medals of this emperor struck in Egypt. The name of the *Emperor Hadrian* is found on the pyramidion of the fourth face of the Barberini obelisk, which now stands in the new promenade of the Monte Pincio at Rome; the cartouche containing it being placed before a figure of the emperor on foot, presenting an offering to *Phré* or the Sun. This monument, however, like the Pamphilian obelisk, is supposed to be, not an Egyptian original, but a Roman copy, executed by Roman workmen. The name of the Empress *Sabina*, the wife of Hadrian, written in phonetic hieroglyphics, is likewise found upon this obelisk. Finally, on the Typhonium at Denderah, two scrolls joined together contain the legend ΑΟΤΚΡΤΡ ΚΣΡΣ ΑΝΤΟΝΗΝΣ, *The Emperor Cæsar Antoninus*, with the ideographic epithet *always living* subjoined; and this is several times repeated on the monuments.

Such is an abstract of the results obtained by the application of the phonetic alphabet to the inscriptions connected with the Greek and Roman periods of Egyptian history. How far they tend to establish the soundness of the original discovery we shall endeavour to explain after we have adverted to the first part of Mr Salt's *Essay*, which applies to the subject immediately under consideration. The late consul-general of Egypt informs us that, on the first intimation of the discovery, he had "conceived a very decided prejudice against the phonetic system," thinking it "founded on too conjectural a basis;" but having received M. Champollion's *Lettre à M. Dacier*, and Dr Young's *Discoveries in Hieroglyphical Literature*, he applied himself seriously to the examination of their contents, "being unwilling to suppose that so much importance could be given, without reason, by many persons of acknowledged talent in Europe, to a discovery which appeared to him only a very vague and conjectural hypothesis."[1] This led to a complete conviction of his error, and enabled him not only to confirm the truth of the "hypothesis" from his own investigations on the spot, but also to add several new phonetic homophones, as well as the names of a number of kings and gods; in regard to which, however, he had, without his knowledge, been anticipated by Champollion. We shall here state as briefly as possible a few of the more remarkable results obtained by Mr Salt in the course of his researches amongst the monuments themselves.

Of names connected with the Greek and Roman periods, Mr Salt was enabled to add to the list of those previously deciphered, 1. that of *Arsinoë*, which was found by him at Gau-Kibeer, Edfou, and Dakké, with a figure of Isis, and the symbols of the female termination subjoined;[2] 2. the name of *Philip*, the father of Alexander, which occurs on the granite sanctuary at Karnak, and on the same building is sculptured the name of his son, who is designated as *Mai-Amun*, or *beloved of Ammon*;[3] 3. a correction of the reading of the name *Berenice*, the final character of which Mr Salt considered as a hawk, a crow, or an eagle, instead of a *vulpanser*, as Dr Young and M. Champollion had concurred in representing it; 4. the names of the Roman emperors *Nero*, *Commodus*, *Hadrian*, *Antoninus*, and one which appeared to be *Marcus Verus Antoninus Augustus*, forming the ornaments of a cornice in the anterior of a small propylon on the west of the island of Philae. The name of Domitian Mr Salt copied from the Beneventine obelisk as delineated by Zoega; and from the whole of these readings he deduced about twenty homophones, in the greater part of which, however, he was, as already mentioned, anticipated by Champollion.

Before proceeding to give the phonetic names of the Egyptian deities, from which, as Dr Murray remarked,[4] after Jablonski, the names of the Egyptian kings are almost all derived, Mr Salt stops to mention an intermediate discovery of no inconsiderable interest. It struck him forcibly, that as the phonetic characters had been applied to the names of stranger kings, the Ptolemies and Roman emperors, so they must likewise, if known, have in all probability been employed in expressing the names of the Ethiopian sovereigns who had previously held Egypt in subjection. And the result proved the soundness of this conjecture. From some sketches made at Abydos, Mr Salt was enabled to decipher the name of ΣΑΒΑΚΟ or ΣΑΒΑΚΟΦΘ, with the same termination as was afterwards found in ΑΜΕΝΟΦΘ; and in a sketch taken from the back of a small portico at Medinet-Habou he discovered the name of ΤΙΡΑΚΑ, whom he conceives to be the same with "*Tirhakah*, king of Ethiopia, who came out to make war against Sennacherib, king of Assyria," as mentioned in the second book of Kings.[1] If this supposed identity be admitted, and if the inscription of these Ethiopian names on the Egyptian monuments be allowed, as we think it must, to have been contemporaneous with the age of the invaders, then it would follow that the phonetic characters were in use about seven centuries before the Christian era, that is, as far back as the reign of Psammeticus and the time of the prophet Isaiah; and a sovereign named in the Bible, of whose existence learned men had entertained doubts, would be restored to history. Further, upon the high granite rocks at Elephantiné, and also beneath the intrusive name of a Ptolemy, Mr Salt deciphered, with the utmost ease, the name ΠΣΑΜΙΤΙΚ, *Psammiticus*, or *Psammeticus*, written phonetically; a name which he also found sculptured on one of the small temples of Elethyas, on the Campensian obelisk, and also on that in Monte Clitorio, of which engravings are given by Zoega at the end of his learned and valuable work on the origin and use of the obelisks.

---

[1] *Essay on the Phonetic System of Hieroglyphics*, pp. 3, 4. London, 1825, in 8vo.

[2] On the noble propylon at Karnak, the finest remaining specimen of Egyptian architecture, this name is also found in conjunction with that of Ptolemy, who is designated as the "father" of Ptolemy, who had for his wife Berenice.

[3] The phonetic hieroglyphics representing the name of *Philip* evolve ΦΛΕΕΠΟΣ, which approaches as near to the sound of the Greek as any other name that has yet been discovered, excepting that of ΚΛΕΟΠΑΤΡΑ, which coincides with it, letter for letter.

[4] See *Summary of Egyptian Mythology*, in Appendix to Bruce's *Travels*, vol. ii.

Mr Salt then proceeds to give an account of some of the principal Egyptian divinities, and the images under which they are represented, together with their hieroglyphic and phonetic names, wherever these were deciphered. He commences with the eight more ancient divinities mentioned by Herodotus, whose names he determines to have been, 1. *Knuph* or *Ich-Neuphi*, or *Kneuph*, represented symbolically by a chicken watching an ostrich feather, or by the feather alone with a crouching figure, or by the flag indicating god, or as the agathodaemon, or by the image of the sacred serpent, which enters into the celebrated union of the globe, wings, and serpent, placed over the entrance of all the temples of Egypt, the phonetic name being uncertain; 2. *Neith*, phonetic name ΝΕΕΤ or ΝΘ, expressed by a zigzag or broken line, two feathers, and a pair of tongs, one of the great goddesses of the firmament, represented as a human figure with the head of a lion; 3. *Phtha*, phonetically ΦΘΑ, having for his emblem a scarabœus,[2] and represented on the temples under the form of a human figure with a scarabœus over its head, sometimes encircled by the globe and serpent; 4. *Amun*, *Amoun*, *Ammon*, commonly represented by a human form of a black colour, with the head of a ram, surmounted by the globe and serpent, and written phonetically ΑΜΝ; 5. *Phré*, the sun, represented generally by a globe or disc, encircled by a serpent, and hieroglyphically designated by the same emblem; 6. *Athor* or *Hathor*, phonetic name ΑΘΡ, represented under the form of a female, with a peculiar head-dress, composed of a globe, encompassed by two slender horns, and surmounted by two long feathers, and symbolized by the figure of a hawk enclosed in a square, with a smaller square at one of its corners; 7. *Buto* or *Maut*, phonetic name ΜΤ, representing the lower firmament, and designated, like Neith, by an outstretched female figure, which is also found sometimes as her symbolical characteristic; 8. *Mendes*, or the generative power of nature, represented under the form of a human figure, with the head of a goat advanced in front of the forehead, and designated by a square, a dot, and a chicken, the phonetic name being unknown.

Of the minor divinities of the Egyptian Pantheon, Mr Salt explains the phonetic names and symbols of, 1. ΕΡΜΣ, *Hermes*; 2. ΤΤ or ΘΘ, *Taut* or *Thoth*, represented by a human figure, with the head of an ibis; 3. ΟΥΣΙΡΕ or ΟΥΣΙΡΙ, *Osiris*, designated, as is well known, by an eye, and a chair or throne; 4. ΑΝΕΦΘΕ, *Anephthe* or *Nephthe*; 5. ΟΡΣ, *Horus*, designated by a hawk, or the figure of a child with one hand pointing to the lips, the emblem of silence; 6. ΑΝΦ, *Anubis*, designated by the head of a shakal or Egyptian fox, commonly mistaken for a dog; 7. ΣΘ, *Seth* or *Sothis*, symbol unknown; 8. ΣΑΡΠΙ, *Serapi*; and, 9. ΙΜΟΥΘΦ, *Imouth*, the Egyptian Æsculapius, the reading of whose name is confirmed by a papyrus containing the expression, ʼΑσκληπιου ὁ ἐστι Ιμουθου ὑιος ʼΗφαιστου, "Asclepius (or Æsculapius), also called *Imouth*, the son of Phtha." Mr Salt then subjoins a tabular list of Egyptian kings and queens whose names are all written phonetically, and concludes with expressing an opinion, that, as the fact of phonetic hieroglyphics having been in use in the earlier periods of the Egyptian monarchy seems to be clearly established, so their application will be found not to have been confined to the names of gods and kings or queens; an opinion the truth of which M. Champollion had already, unknown to Mr Salt, produced a pretty extensive series of readings to confirm. That the reader, however, may not be bewildered by details, but may be enabled to comprehend the true nature and bearing of these investigations, it may be proper to pause a little in our exposition, and to take a retrospect, not merely of the results obtained, but of the principles which have guided inquiry, and of the evidence by which the different readings are supported.

The phonetic system of the ancient Egyptians, as revealed by the discoveries of Young and Champollion, differs so greatly from every mode of writing known or practised amongst Europeans, that a little scepticism at the outset of our acquaintance with it is perhaps unavoidable. But we are much mistaken if the evidence which prevailed over the early incredulity of Mr Salt will not prove sufficient to convince the intelligent reader that, however anomalous this system may appear, it was in reality employed by the Egyptians as an instrument of communication, though most probably not to the extent which some contended for. And, first, the fact of characters being used in a similar manner, in a living language which upon the whole is not written phonetically, shows that the system in question is not so contrary to analogy as might at first be imagined. The Chinese, for instance, is a syllabico-ideographic language, consisting of diversified combinations of certain elements or *keys*, two hundred and fourteen in number; but, in order to express *foreign* sounds, or combinations of sounds, the characters of that language, instead of retaining their ordinary values, are rendered simply *phonetic* by an appropriate mark, and thus represent merely the initial or predominant sound of the name or word of which they are the common and recognised signs. Of this M. Klaproth has given an example in the Chinese method of transcribing the name of *Maria*, which is represented by three characters, *Ma-li-ya*, rendered phonetic; the first signifying *jasper*, the second *gain*, and the third *second in rank*.[3] The same author also informs us that the ordinary system of Japanese writing resembles, more perhaps than any other, that employed by the ancient Egyptians. "Les Japonais," says he, "mêlent leurs signes syllabiques, *exprimant des sons*, aux caractères idéographiques des Chinois, exactement comme les Egyptiens, dont l'écriture se composait à-la-fois de signes phonétiques et de symboliques." Lastly, on this point, M. Saint-Martin, who has succeeded in deciphering an inscription in the cuneiform characters, makes it evident by the word *Khchearcha, Xerxes*, which is written phonetically, that, in representing proper names, these characters were employed on the same principle as the phonetic hieroglyphics; and it is a singular enough coincidence that M. Champollion recognised the same proper name, spelled in the very same manner, in a cartouche engraved on a beautiful vase of oriental alabaster in the cabinet of the king at Paris.

[3] *Examen Critique des Travaux de Champollion*, p. 25.

In the second place, the progress of the discovery, and the facts connected with it, seem to demonstrate its general truth and certainty. The name of *Ptolemy*, taken from the Rosetta inscription, rests upon the basis of an accompanying translation; the same thing may be said of the name *Cleopatra*, obtained from the obelisk of Philae; and from these two have the elements of the phonetic alphabet been derived. But the strongest evidence, perhaps, in support of this alphabet, is the perfect agreement of the results obtained by means of it with known facts in the history of the individuals whose names have been deciphered, with the dates of the edifices on which these names are sculptured, or with other circumstances of a personal or general nature, the combination of which it is impossible to ascribe to accident, or to account for in any way except by admitting the truth and certainty of the discovery. Thus, the name of Ptolemy is found only upon buildings which, in the style of their architecture, are evidently of a date posterior to the older monuments of Egyptian art. The name of Cleopatra is found, *as mother of a Ptolemy*, at Ernent and at Kous, where there is also a Greek inscription, in which Cleopatra is represented as reigning *with her son;* and a queen of the same name is represented as the wife of a Ptolemy at Gau-Kibeer, at Dakké, in a temple of Philae dedicated to Aphrodite, and in another discovered by Mr Salt, dedicated to Æsculapius, in all of which it corresponds with the Greek inscriptions found there; whilst, upon many other temples, a Cleopatra is constantly associated with a Ptolemy. On the magnificent propylon at Karak, one of the wonders of Egyptian architecture, the name of a Ptolemy accompanies, as usual, that of Cleopatra; the name of Alexander, called the son of Ammon, is found in juxtaposition with that of his father Philip; but at Edfou, the name of Ptolemy is followed by the title of Alexander, and by the name of Berenice his wife. Again, the titles of *Autokrator, Sebastos, Eusebes, Kaisar*, are continually found in conjunction with the names of Roman emperors, but never with those of the Ptolemies; the titles of *Germanicus, Dacicus*, are found annexed only to the names of those sovereigns who bear these titles on their medals; the name of Hadrian is prefixed, as it ought to be, to that of the Emperor Trajan; and the greater part of the names of the emperors from Augustus to Commodus are found upon temples and edifices, the style of which indicates that they are of more modern date than those which belong to the age of the Ptolemies. Nor are these names and titles, which have all been interpreted by means of the phonetic alphabet, confined to a few insulated scrolls. On the contrary, they are sculptured by hundreds throughout the different edifices in which there are no scrolls that do not apply to those who were concerned in their construction. The oval or ring containing the name of Hadrian is sculptured on a column the hieroglyphics of which are known by a Greek inscription to have been executed immediately after his reign; the name of *Soter* repeatedly occurs, in phonetic characters, amongst the hieroglyphics upon the *soros* or mummy-case of a person whose name was Soter, as appears by the Greek inscription upon the same coffin; and this name is also found, in the Greek, immediately after that of *Osiris*, exactly as Dr Young had before stated, that the names of persons deceased were found in the hieroglyphics on the body. Here, then, we have a mass of concurring evidence, a series of corroborative circumstances, the coincidence and harmony of which amount to a demonstration of the truth of the principles on which the phonetic alphabet is founded, and of the certainty of its application, in as far at least as regards proper names. True results can never be obtained from false assumptions.

Thirdly, it is greatly in favour of the phonetic system of interpretation that the same lax and uncertain use of the vowels, which is observed in the hieroglyphic writing, prevails also in the Coptic,[1] where one vowel is constantly put for another, and there is the same confusion between the L and the R. The mixture of symbolic and phonetic signs seems likewise a necessary consequence of the process by which, it may reasonably be supposed, the transition from ideographic to phonetic writing was produced. In this, as in so many other things, necessity was the mother of invention. The impossibility of representing or discriminating by symbols the proper names of individuals, led, as in the Chinese, to the employment of phonetic characters, or, in other words, to the separate indication of each letter or sound in the name by means of an appropriate sign used phonetically; but as the names of the kings, which were probably the first they desired to record, were usually formed from those of the gods, as *Thoth*-mes, *Thoth*-mosis, *Amun*-mai (Mai-*amun*, Memnon), *Amun*-ophth, *Ra*-m-ses, *Osir*-tesen, the sign which represented the name of the god would still indicate, in a compendious and intelligible manner, the syllable itself, instead of being composed into separate letters, each with a separate representative. Thus, in the phonetic name of Rameses or Ramses, the emblem or symbol of the sun stands for the syllable RA. M. Klaproth has not, we think, allowed sufficient weight to these considerations, in some of his strictures on M. Champollion. It is obvious, however, that, as the Coptic is the descendant of the ancient Egyptian, and as a knowledge of the latter can only be obtained by means of the former, our confidence in the phonetic interpretation must be increased when we find that it evolves the very same peculiarities observed in that language which embodies all that remains of the idiom of the Pharaohs.

But it is time to return to M. Champollion. We have already seen, that the primary idea developed in his *Lettre à M. Dacier* received a more ample and extended application in his *Précis du Systême Hiéroglyphique des Anciens Egyptiens*, the first edition of which appeared in 1824; that in his *Lettres à M. de Blacas*, written from Turin, he made numerous applications of his system, particularly to the ancient dynasties of Egypt; and that, on his return from Italy, he published a second edition of his *Précis*, in which, however, he introduced but few modifications of the statements and assertions contained in the first, and in no degree altered or modified the opinion which he had therein expressed as to the phonetic nature of the great mass of the hieroglyphics. This work, which

---

[1] This has been very clearly shown by Mr Tattam in his excellent *Grammar*, and by Professor Kosegarten in his very learned work *De Prisca Ægyptiorum Litteratura*, Vimariæ, 1828, in 4to. See also *Quarterly Review*, vol. liii. p. 110.

Champollion, &c.

is written with admirable clearness, and often displays great ingenuity, has for its object to demonstrate, by inductive interpretations, 1. That the phonetico-hieroglyphic alphabet is applicable to the royal legends of every epoch in the history of Egypt; 2. that this alphabet is the true key to the whole hieroglyphical system; 3. that the ancient Egyptians constantly employed hieroglyphics to represent alphabetically the sounds of words in their spoken language; 4. that all the hieroglyphical inscriptions are, to a certain extent, alphabetical; 5. that different kinds of characters, the nature of which respectively he endeavours to define, were simultaneously employed in the hieroglyphical texts; and, lastly, from all these propositions, each of which is supported by a great variety of readings and examples, he attempted to deduce a general theory of the graphic system of the ancient Egyptians, generalising with a premature boldness, which afterwards exposed him to the merciless severity of M. Klaproth's criticism. With all its errors, contradictions, and inconsistencies, however, this work displays extreme ingenuity, infinite acuteness, and often rare felicity in the development of views, suggested, perhaps, by an incidental analogy, which would have escaped a less ardent and penetrating observer. This will be sufficiently evinced by the following brief abstract of its contents.

Neglecting the purely controversial, which is the least interesting part of the work, and also omitting that portion in which he retraces the results already obtained, we proceed at once to the application which he makes of the phonetic alphabet to different hieroglyphical groups and grammatical forms of constant recurrence in the inscriptions. The hieroglyphical groups of most frequent occurrence in the texts are those which correspond to *son, daughter, child* or *nursling, offspring, father, mother, sister, king,* and *place* or *locality*. 1. The idea of *son* is expressed by three different hieroglyphic groups, which are often employed upon the same monument. The most common is a goose SH or SCH, and a small perpendicular line A or E, forming the word SHA, SHE, or SHI, connected with the Sahidic SHA, *oriri, nasci*, and the Memphitic SHAI of the same import, and involved in the compounds SHENIOT, *son of father*, or brother consanguinean; SHENMAU, *son of mother*, or brother uterine; SHENSON, *son of brother*, or cousin. The second group is formed of an oval or ellipse S, and a small perpendicular line E, making SE or SI, which appears in the composite Coptic name HÔR-SI-ÊSE or HÔR-SI-ÊSI, *Horus the son of Isis.*[1] The third is composed of the figure of a child with its hand at its mouth, representing Σ in the title Σεβαστος of the Pamphilian obelisk, and the small perpendicular line, which, as before, give the word SE or SI. A fourth group, which in the hieroglyphical inscriptions expresses *filiation*, is written MS, equivalent to the Coptic MES, *enasci, gignere*, whence MAS and MISE, *natus, infans, pullus.*[2] But this group is generally employed to indicate maternal descent, whilst the group SHE or SI commonly expresses paternal descent. Thus, HÔR SE Ñ OUSIRE MES Ñ ESE, *Horus, son of Osiris, born of Isis.* 2. The group expressing *father*, formed of the segment of the sphere T, the horned snake OU, and the small perpendicular line E, reads TOUE, which is traceable to the Coptic root TAOUE, *producere, proferre*, probably derived from TA, *dare*, and OUÔ, *germen*. 3. In the hieroglyphical texts, a vulture represents symbolically the idea of *mother*,[3] in Coptic MEOU, MAAU, and MAU, according to the dialects; and this character is accompanied with another, the segment of a sphere T, which gives MAUT or MOUT; a reading the more remarkable, as the word Μουθ has been transmitted to us by Plutarch as pure Egyptian for *mother*, and as one of the surnames of Isis.[4] 4. The group expressing king is composed of a plant S, a segment of a sphere T, and a zigzag or horizontal line N, forming STN, the skeleton of the Coptic word SOUTEN, *regere, dirigere*. 5. The word τοπος, *place*, in the Greek text of the Rosetta inscription, is expressed in the hieroglyphical text by an owl M, and an extended arm A, thus giving the Coptic word MA, *place*, which Dr Young erroneously supposed to signify *father*.

We come next to the signs or groups in the hieroglyphical texts which perform certain grammatical functions, and express genders, numbers, persons, and times or tenses. And, 1. The ordinary mark of feminine groups is, the segment of a sphere T, answering to the Coptic article T', which also characterises the feminine gender. Thus, SI, *son*, TSI, *the daughter;* SN, *brother*, TSN, *the sister;* and TMAU, *the mother*. But, in the hieroglyphical inscriptions, the feminine article is sometimes placed at the end of a group, which accounts for our meeting sometimes with MAU, *mother*, and MAUT, *the mother;* although the Coptic presents no example of this species of inversion in the use of the article. The masculine definite article in Coptic is P, the equivalent of which is the striated square, the constant sign of the same letter in all the Greek and Roman inscriptions. The plural articles are two in number; first, the zigzag, or the simple horizontal line N; and, secondly, the vase, which is also N; both being followed by the small perpendicular line E, so that we have the Coptic articles NE, NI, and NA, of all which the Rosetta inscription presents several examples. 2. The plural of nouns is expressed either by prefixes or by terminations. The prefixes are the broken or horizontal line N, which is the determinate plural article, and the vase, also N, followed in both cases by the small perpendicular line E, and equivalent to NE or NI. The terminations are either two small perpendicular lines indicating duality, or three such lines indicating indefinite plurality, as Dr Young originally remarked. The two small lines, taken phonetically, are in proper names and others equivalent to the E or I; the three lines, preceded by the crooked staff (*lituus*), or by the quail, represent the Coptic plural termination OUE or OUI. 3. As in the Sahidic or Theban dialect of the Coptic certain qualifying words are formed by the conjunctive NT, *qui*, so in the hieroglyphical texts a number of groups expressing qualifications, or employed adjectively, commence with the vase and the segment of the sphere, the phonetic signs of NT. 4. In the hieroglyphical texts there has only been recognized one distinct group representing a pronoun, the subject of a proposition: it is the pronoun of the third person singular masculine, which is written phonetically NTOPH, being letter for letter Coptic. But numerous examples occur of pronouns of the second, and particularly of the third person, combined with nouns and verbs, sometimes as prefixes, though more commonly as affixes. Thus, keeping in view that NPH, or simply PH, equivalent

---

[1] Mr Akerblad was the first who gave the true import of this composite Egyptian proper name.

[2] In the Rosetta inscription, this word, combined with the two characters which express *day*, corresponds to τα γενεθλια of the Greek text, where the celebration of Ptolemy's birthday is mentioned.

[3] Horus Apollo informs us (*Hieroglyphica*, i. No. 12), that to denote *mother* the Egyptians painted a vulture, ἐπειδη ἀρρεν ἐν τουτῳ τῳ γενει των ζωων ὀυχ' ὑπαρχει.

[4] Ἡ δ' Ἰσις ἐστιν ὁτε και ΜΟΥΘ και παλιν Ἀθυρι. . . Σημαινουσι δε τῳ μεν πρωτῳ των ὀνοματων ΜΗΤΕΡΑ, τῳ δε δευτερῳ, κ. τ. λ. (*De Iside et Osiride.*) The statement of Plutarch is confirmed by the fact that, wherever the representation of Isis occurs on the monuments, it is accompanied by the legend ESE DJER-MOUT, *Isis, powerful mother*.

Champollion, &c.

to the Coptic NAPH or NEPH, is the masculine, and S, equivalent to the Coptic NES, the feminine affix of the third person, we have TOUEPH, *father of him*, TOUES, *father of her;* MOUTPH or TMOUPH, *the mother of him*, MOUTS, *the mother of her;* SEPH, *the son of him*, SES, *the son of her;* TSEPH or SETPH, *the daughter of him*, TSES or SETS, *the daughter of her;* SNPH, *the brother of him*, SNS, *the brother of her;* TSNPH or SNTPH, *the sister of him*, SNTS, *the sister of her.* 6. In Coptic the preposition N, prefixed to a noun, indicates the genitive case; and in hieroglyphics the broken line N performs the same function. Thus, in all the hieroglyphical legends placed beside the representation of the god Horus, we read either HÔR SHE′ N OUSIRE′, *Horus, the son of Osiris*, or HÔR SHE′ N OUSIRE′ MS N ESE, *Horus, son of Osiris, born of Isis.*

In the hieroglyphical branch of the Rosetta inscription we meet with verbs in three distinct tenses, present, past, and future, but only in the third person. The characteristic signs of these tenses, taken phonetically, are however nothing more than Coptic prefixes and affixes. Thus the third person plural of the present is indicated in the hieroglyphical texts by a phonetic sign of S, prefixed to the group representing the verb, and equivalent to the Coptic prefix SE. Next, the third person of what seems to be a past tense is indicated by the affix of the horned snake PH if the subject be masculine, and by that of the two sceptres S, if the subject be feminine. Of these verbal forms distinct traces appear in one of the past tenses of the verb DJÔ, *dicere*, as PEDJAI, PEDJAK, PEDJE, PEDJAPH, PEDJAS, in the Sahidic, and PEDJEI, PEDJEK, PEDJE, PEDJEPH, in the Memphitic dialect. Lastly, the third person plural of the future, in which form appear all the verbs in the last nine lines of the hieroglyphical text of Rosetta, is marked by a group of three characters, the recurved stem S, the broken line N, and the three small perpendicular lines I or E, from which we obtain SNE, equivalent to SENE or SENA, the characteristic mark of the third person plural of the Coptic future definite. So much, then, for the application of the phonetic alphabet to different hieroglyphical groups of frequent occurrence, and also to certain grammatical forms; an application which, in Champollion's estimation, goes far to prove his general position, that a great part of every hieroglyphical text is written alphabetically.

The next subject of investigation, viz. deciphering the hieroglyphical names of the Egyptian divinities, is one of equal interest and importance; but after the notice which has already been taken of Mr Salt's readings, and the publication of Dr Young's catalogue at the end of the article EGYPT in the present work, it will only be necessary to advert to the additional results obtained, and the corrections applied by M. Champollion. And here it may be observed generally, that the images of the gods and goddesses with which the Egyptian monuments of all orders abound, are preceded by hieroglyphical legends, invariably commencing with three or four characters, importing, *This is the aspect*, the *mode of existence*, the *presence*, or the *resemblance;* and this formula is succeeded by the preposition N, *of*, expressed by the broken or horizontal line, after which comes the proper name of the god or goddess, which is always written in the same phonetic characters with those of individuals. But there is this difference observable, that instead of the figurative character *man*, which is found at the end of the latter, the names of divinities are constantly terminated by the ideographic sign of *god* or *goddess*, as the case may be; a sign the import of which was determined by a comparison of the Greek with the hieroglyphical and enchorial texts of the Rosetta inscription. By this initial formula, and this terminal character, the names of the Egyptian divinities may easily be recognised on the monuments.

From the testimony of the Greek writers, there can be no doubt that the god represented on the monuments by a human figure with the head of a hawk, surmounted by a globe or disc, is the Egyptian Ἡλιος, *Sun*, denominated RA, RE′, and PHRE′. This name, which is of very frequent occurrence, enters into the composition of Rameses or Ramses, written *Ra-m-ss.*[1] *Ammon, Amoun*, or *Amun*, the principal deity of Thebes, represented with the head of a ram, and assimilated by the Greeks to their own Ζευς, is read AMN by M. Champollion as well as by Mr Salt. On the paintings and bas-reliefs, however, the former discovered a second divinity with a ram's head, but distinguished from the first either by an *uræus* or asp placed between his horns, or by a complicated and peculiar head-dress, containing a solar disc and one or more *uræi.* This divinity, like the preceding, bears the name of AMN, sometimes that of AMON-RA or AMON-RE′, but more frequently a third name, in the orthography of which there are four distinct varieties, viz. NB, NOUB, NM, and NOUM. Now, if the B of the name NB be pronounced in the Coptic manner, like a V or an F, we shall obtain NEV or NEF, the god Κνὴφ, who, according to Plutarch, was the principal divinity of the Thebaid; and, in like manner, if NOUB be pronounced NOUF, the latter will at once suggest the ΚΝΟΥΦ-ις of Strabo, identical with the Κνηφ of Plutarch and Eusebius. On the other hand, if NOUB be pronounced in the ordinary way, we shall obtain the ΧΝΟΥΒ-ις of the inscription at the Cataracts, Αμμωνι ὁ και Χνουβει, and of the Gnostic or Basilidian Stones, and also the *Ammon-Chnubis* of the Latin inscription discovered by Belzoni in the quarries of Syene. Lastly, in the variation NOUM we discover the ΧΝΟΥΜ-ις of the Basilidian Stones, which bear indifferently Χνουφις, Χνουβις, and Χνουμις, thus showing that these various names are applied to one and the same divine being represented under the form of a serpent.[2]

According to Eusebius, *Phthah* or *Phtha*, one of the prin-

---

[1] From the name of this divinity was also derived that of PHRA, or, by inserting (*more orientali*) a vowel, PHARAH, identical with PHARAOH, the denomination common to all the monarchs of Egypt. Josephus informs us (*Antiq. Jud.* lib. viii. cap. 6, § 2) that amongst the Egyptians *Pharaoh* signified RE′;—and that to each king they gave the title of *Sun*, that is, called him PHRE′ or PHRA, is demonstrated by all the royal legends, and even by the cartouches themselves, where this title is often expressed, not with the symbolical disc, as when applied to the divinity himself, but with an equivalent character, the figurative image of the sun, that is, a human figure with the head of a hawk surmounted by a disc. This idea, which was originally suggested by Mr Wilkinson, has been fully developed and illustrated by Signor Rosellini. "Il titolo di Faraone," says the latter, "dobbiamo prenderlo dal testo originale della Bibbia, ove sta scritto פרעה, *Phrah:* che tale è la sua naturale pronunzia un poco alterata dai Masoreti, forse non a capriccio, ma per rendere il suono Egiziano della voce ΦPH, *Phré*, il quale noi non conosciamo, e che potè probabilmente conservarsi nella tradizone degli Ebrei. Or dunque tra il *Phré* o *Phra* Egizio, ed il *Phrah* biblico è tanta l'analogia, che non mi sembra lasciar luogo al dubbio sulla identità delle due voci. Ma parrà forse strano che Mosè rendesse colla lettera *Ain*, appoggiato anche dalla *He* finale, un semplice suono vocale Egizio, che risponde alla *Heta* de caratteri Copti. Alla qual cosa rispondo, che la *He* finale può essere enfatica, completiva, o espletiva, come vuol dirsi; e tale rimane nella stessa pronuzia dei Masoreti. Ma che la *Ain* sia la lettera usata costantemente dagli Ebrei per esprimere l'elemento E O A del Egizia voce *Phra* o *Phré*, Mosè medesimo ce ne assicura. Trascrivendo egli il nome della città Egiziana fabbricata dagli Ebrei e chiamata con Egizio nome *Ramesses*, scrisse Ebraicamente רעמסס, *Rhamses.*" (See *I Monumenti dell' Egitto e della Nubia, parte prima*, tom. i. pp. 116, 117.)

[2] All the details transmitted by the Greek writers concerning the mode in which the Egyptians represented *Ammon-Kneph, Ammon-Knuphis*, or *Ammon-Chnoumis*, are perfectly applicable to the images of the god whose hieroglyphical names have been found to be

Champollion, &c.

cipal Egyptian divinities, chiefly adored at Memphis (MA-M-PHTHA), and assimilated by the Greeks to their Ἡφαιστος, was believed to be the son of the god Knêph or Ammon-Chnuphis or Chnubis. In constant juxtaposition with the images of the *demiurgos*, or creator (celui qui dispose la matière) sculptured on the bas-reliefs of Ibsambul, Philae, Edfou, Ombos, and Thebes, is the figure of a second divinity (συνναος θεος), distinguished either by a solar disc and crescent surmounting his head-dress, or by the ordinary sceptre of the gods, combined with a nilometer, a handled cross, a lash, and a balance, or enveloped from neck to heel in a close tight vestment, leaving at liberty only the hands which hold the sceptre; and there can be no doubt that this figure was intended to represent Phtha, because the adjacent hieroglyphical group contains the name of Phtha expressed in phonetic characters. These readings, then, serve to confirm the statement of Eusebius, that Phtha was believed to be the son of Knêph or Ammon-Chnuphis, the demiurgos of the Egyptian mythology. Amongst the titles which the decree of Rosetta applies to Ptolemy Epiphanes is *Mai-Phtha*, ἠγαπημενος ὑπο του Φθα, *beloved of Phtha*. *Petbe*, whom the Greeks call Kronos and the Latins Saturn, was deciphered from a Coptic manuscript in the Borgian Museum. In a Greek inscription discovered by Ruppel at Schélé, between Elephantiné and Philae, and containing the names of different Egyptian divinities, is that of the goddess ΣΑΤΗ-Σ, or ΣΑΤΙ-Σ, which occurs immediately after Ammon-Chnoubis, and corresponds to the Ἡρη of the Greeks and the *Juno* of the Romans. But on the bas-reliefs the figure of Ammon is always accompanied by that of a goddess, whose distinctive emblem is a large feather stuck in her head-dress, and whose hieroglyphical name expressed phonetically is *Sate* or *Sati*, identical with the Σατης or Σατις of the Greek inscription above mentioned. Of the divinities better known, the names deciphered by M. Champollion are, 1. *Anubis*, son of Osiris and Nephthé, written ANB and ANBÔ, in Greek ANου-B-ις, and distinguished by the head of a shakal or fox, which the Greeks mistook for that of a dog; 2. *Osiris*, the husband-brother of Isis, written OUSRE′ and OUSRI, or OUSIRE′ and OUSIRI; 3. *Arueris*, the twin-brother of Osiris, written AROERI, HAROERI, or HAROUERI; 4. *Anucis*, assimilated to the Ἑστια or *Vesta* of the Greeks, and written ANK, *Anouk* or *Anouké*, in Greek Ανουκης or Ανουκις; together with *Horus*, *Apis*, *Mnevis*, *Besa*, *Socharis*, *Thermouthis*, and the names of the greater part of the Decans represented on the circular zodiac or planisphere of Denderah. From all this, then, the inference deduced by Champollion is, that the Egyptians employed phonetic hieroglyphics in writing the names of the different members of their populous Pantheon.

Cham lion,

Results at once curious and interesting were likewise obtained by the application of the phonetic alphabet to the names of private persons of both sexes. Of these the Greek writers have preserved a considerable number, all of them composed of the proper names of divinities, with the addition of some distinctive epithet, and easily explicable with the aid of the Coptic. Thus Αμυνταιος signifies given by Ammon; Νιτωκρις, victorious Neith; Ἀθωθις, engendered of Thoth; Μαρις or Μοιρις, gift of Ré, or the Sun; Σεμφουκρατης, Hercules-Harpocrates; Θομαεφθα, the world friend of Phtha; Πανσις, the consecrated to Isis; Πανουφις, the consecrated to Chnuphis; Παθερμουτ, the consecrated to Thermuthis; Πετησις, he who belongs to Isis; Πετοσιρις, he who belongs to Osiris; Μανσις, gift of Isis, or loving Isis; Ψεναμουν, the child of Ammon; Σενοσορ, the child of Osiris; Πετεαρποκρατης, he who belongs to Harpocrates; Πετεαρωηρις, he who belongs to Aroueris; and so of the rest. The same observation may be applied to the names deciphered by Champollion; they are all formed on the analogy indicated by those which the Greek writers have preserved, and by their composition they show that the mythological system of Egypt, like that of India, had become interwoven with the whole texture of society, and with every circumstance of life and manners. Religion, indeed, like a subtile spirit, insinuated itself into every thing; and even the names of private individuals contain evidence of its universal predominance. Thus we find *Petamun*, he who belongs to Ammon; *Petamura*, he who belongs to Ammon-Ra; *Amenoph*, Αμενωφις, an abbreviation of *Amenoftep*, Αμενωφθης, approved of Ammon; *Amontet*, obedient to Ammon; *Phtaftep* or *Ptahtefp*, approved of Phtha; *Ftep-an-Ptah* or *Ftep-Ptah*, the approved of Phtha; *Ptahdjer* or *Ptahdjor*, Phtha the powerful, or the powerful by Phtha; *Pethôrpré*, he who belongs to Horus and the Sun; *Petepré* or *Petephré*, the same with the *Putiphar* or rather *Putiphrah* of Scripture, and in the Coptic text of Genesis regularly written *Petephré*, he who belongs to *Ré* or the Sun (priest of the Sun); *Isidjer* or *Isidjor*, Isis the great or powerful; *Hatôrshé* and *Hatôrshet*, child (male or female) of *Hathôr*; *Hôr-amun*, Horus-Ammon; *Hôrsiêsi*, Horus, son of Isis; and *Amun-Hôrsiêsi*, Ammon-Horus, son of Isis. It is to be observed, however, that the Egyptian proper names of private individuals are never included in an elliptical ring or cartouche, which is the distinctive mark of the proper names of sovereigns alone; they are written like the ordinary current text of the hieroglyphics, but are constantly terminated either by the figurative emblem of *man*, or by the sign of the feminine gender, as the case may be. From this branch of his analysis Champollion concludes that the proper names of individuals were written phonetically; and consequently that the opi-

---

AMN, NB, NOUB, and NOUM. Eusebius informs us that the Egyptians represented the *demiurgos*, or creator of the world, under a human form, covered with blue flesh, encircled by a zone or girdle, holding a sceptre, and having on the head a royal ornamented head-dress of feathers. Porphyry gives us the same information. "Hujus porro Κνὴφ imaginem, inquit, humana forma depingunt, colore cæruleo, zonam tenentem et sceptrum, pennam gerentem in capite; ovum ab ore producit, a quo nascitur deus quem Ægyptii Phtha, Græci Vulcanum vocant." On all the monuments the god called alternately AMUN and NOUB accordingly appears under a human form, with flesh painted blue, encircled with a zone, and having his head-dress surmounted by two enormous feathers of different colours. Eusebius further informs us (*Præparatio Evangelii*, lib. iii. cap. 9, p. 115, Paris, 1628) that *Knaph* was emblematically represented under the form of a serpent; and we have already seen that, on the Basilidian Stones, the names Χνουφις, Χνουβις, and Χνουμις, are accompanied by the image of a serpent. On the monuments in the elder style of Egyptian art, this divinity is sometimes found with an *uræus* on his head; but he is more frequently preceded or followed by a huge serpent nearly covering his visible image with its voluminous coils. Knêph was regarded by the Egyptians as the Ἀγαθοδαιμων, or good genius, and, in this character, he was also represented by a serpent. Nor is it undeserving of notice, in considering his distinctive attributes or emblems, that the surname of Νεοαγαθοδαιμων, given by flattery to Nero upon those of his medals which were struck in Egypt, is combined with the image of an enormous bearded serpent having its head ornamented with a symbolical head-dress. Lastly, the Greek and Latin inscriptions, in which *Ammon-Chnoubis* is mentioned, were found, the one in the isle of Schélé, near Syene, and the other at Syene itself; in short, at a small distance from the isle of Elephantiné, where Strabo places the temple of Κνουφις, and where, according to Eusebius, the divinity worshipped was represented under a human form with the head of a ram surmounted by a solar disc, and had the flesh painted blue. There can be little doubt, then, that the god who, in the hieroglyphical text, bears the name of NEB or NEF, NOUB or NOUF, and NOUM, is identical with Ammon, and the divinity whom the Greeks called *Knêph*, *Chnuphis*, and *Chnumis*. (See *Précis du Système Hiéroglyphique*, pp. 143, 144, 145, 146.)

Champollion, &c.

nion originally expressed by Dr Young, and repeated by himself in his *Lettre à M. Dacier*, that the phonetic hieroglyphics were confined to the transcription of words, and *foreign* to the Egyptian language, is erroneous.

The next subject which engaged the attention of Champollion was the analysis of the royal titles and qualifications inscribed on the more ancient Egyptian monuments; an analysis the object of which is to show that, even anterior to the Persian invasion, the Egyptians employed in their hieroglyphical texts characters representing the sounds of the spoken language; and that these words are expressed by signs similar in form and in value to those which were afterwards used for transcribing the proper names and titles of the Greek kings and Roman emperors. In his *Lettre à M. Dacier*, M. Champollion proved by an unbroken series of facts that the Egyptians wrote phonetically, or employed the figures of objects to express sounds, from the conquest of Egypt by Alexander the Great (A. C. 332) till the close of the reign of Antoninus (A. D. 161), a period of about five centuries. But as the Persian conquest preceded the Macedonian by nearly two hundred years (193), the question which next arose was, whether, in the interval between these two conquests, and still more in the periods of the Egyptian monarchy anterior to the first or Persian, any traces of the same system of writing could be discovered. If this point were determined in the affirmative, M. Champollion conceived that the chain of evidence would thus be rendered complete. His reasoning, however, involves several elements of uncertainty. In the first place, the period at which any given name was inscribed on a monument may not have been contemporary either with the erection of the monument itself, or with the age of the individual whose name has been so inscribed. Secondly, the style of the architecture of the monuments is by no means an infallible indication of the epoch to which their construction should be referred, inasmuch as the rise and decline of the art must necessarily exhibit many points in common, and show nearly the same relative imperfection, and as the more ancient are consequently in danger of being confounded with the more modern edifices. Thirdly, though the dates of the monuments may be ascertained from these dedications, or from independent historical authority, the time when any given name was inscribed thereon is not determinable by the same evidence, and can only be inferred from accessory circumstances, which seldom amount to more than a probability, the value of which, in ordinary circumstances, cannot exceed that of a reasonable conjecture.

But, however this may be, we shall complete our abstract of M. Champollion's investigations by exhibiting a few of the results which he obtained by deciphering hieroglyphic names sculptured on the monuments supposed to belong to the early age of Egyptian art. And, 1. In a cartouche engraved on a vase of oriental alabaster, preserved in the cabinet of the king at Paris, M. Champollion, as already mentioned, deciphered the name of *Xerxes*, written KHSCHEARSCHA, which is the Persian name of that monarch, without any other omission than that of a sort of medial vowel; and this hieroglyphic name is accompanied by five characters, the phonetic values of which give the word IERINA or IRIENA, the same with IERE, *Iranian* or *Persian*. 2. In the twenty-ninth or Mendesian dynasty Manetho places a king whose name is written 'Αχωϱις, probably the 'Ακοϱις of Diodorus Siculus; and this king had for his immediate predecessor and immediate successor two princes of the name of Νεφεϱιτης, as written by Manetho, or Νεφεϱευς, as written by Diodorus. But on two sphinxes, the style of which approaches that of the sculptures executed under the Greek kings of Egypt, were found the hieroglyphical name of a king HAKR, 'AKOP-ις, and that of a king NAIFROUE' or NAIFROUI, supposed to be identical with *Nephereus* or *Nepherites*. 3. On the Campensian obelisk, which Augustus caused to be transported from Egypt to Rome, and placed as a gnomon in the Campus Martius, may be read PSMT or PSMTK, the skeleton of the name of Psammetichus,[1] one of the most enlightened kings of Egypt, who opened the ports of that kingdom to the Greeks, encouraged commerce, patronised the arts, and sought to revive the maritime power of his country. 4. According to Manetho, the second king of the twenty-third or Tanite dynasty bore the name of 'Οσοϱθος or 'Οσοϱθων. But on a granite obelisk amidst the ruins of Heliopolis is sculptured the name of a prince called OUSORTASEN or OSORTASEN, which also occurs on a small statue of carnelian in the cabinet of M. Durand, accompanied by the legend, "the son of the Sun, beloved of Phtha."[2] This Pharaoh must not however be confounded with the OSIRTESEN of Mr Wilkinson, the last monarch but one of the sixteenth dynasty, and he with whom the monumental history of Egypt is supposed to commence. 5. From the same monuments have been obtained the names of several other kings and queens belonging to the twenty-third dynasty, particularly those of PTAHAFTEP, the Petubastes of the Greeks, and father of Osorthos; RAN, his queen; PSJAM or PSDJAM, *Psammus*, ὀν 'Ηϱακλεα 'Αιγυπτιοι 'εκαλεσαν, the son and successor of Osorthos; AMONSCHET, daughter of Osorthos, and sister of Psammus; BEBA or BEBO, queen of Psammus; and AMONRAOU, his son, probably the last scion of the Tanites. 6. The head of the twenty-second or Bubastite dynasty is denominated by Manetho Σεσογχις or Σεσογχωσις, being the Pharaoh who in Scripture is called *Sesak*, *Shishak*, *Shushak*, and who, in the reign of Rehoboam the grandson of David, pillaged Jerusalem, and carried off "all the shields of gold which Solomon had made."[3] Upon one of the colonnades which decorate the court of the grand palace at Karnak are two royal legends, the prænomen in the first of which contains the title "approved of the Sun," followed by "the beloved of *Ammon*, *Scheschonk*," apparently identical with the *Sesonchis* of Manetho; but, in the second legend, we read "the beloved of Ammon, *Osorkon*," and the king called 'Οσοϱχον, who has sometimes been confounded with 'Οσοϱθων, was the immediate successor of Sesonchis. A variety of other legends serve to confirm this conclusion. 7. The next Pharaonic name deciphered by Champollion is that of the head of the nineteenth dynasty, which was one of the Diospolitan. It occurs on almost every monument executed in the ancient style of art; it is written REMSES, RAMSES, AMUN-MAI-RAMSES, AMUN-RAMSES-MAI; and, according to Champollion, it is that of Rameses the Great, the same sovereign who is called *Sethosis* by Manetho, *Sesoosis* by Diodorus Siculus, and *Sesostris* by Herodotus and Strabo. This conclusion is not hypothetical or conjectural; it has been established by a very elaborate historical investigation, in which, as appears to us, the identity of these various names has been made out in a very satisfactory manner. 8. Lastly, of the sovereigns belonging to the eighteenth dynasty, which was also Diospolitan, Champollion deciphered those of Meiamoun-Ramses, Ramses I., Amenophis II. whom the Greeks, mistaking a title (Meiamoun) for a name, called *Memnon*, Amenophis I., and, finally, that of Thouthmosis, the founder.

---

[1] See the engraving given by Zoega of this obelisk, which was from the first believed to be the work of a Pharaoh. (Plin. *Historia Natural.* lib. xxxvi. c. 8, 9, 10.) The name on this obelisk is, according to Champollion, that of Psammetichus I. who flourished about 120 years before the Persian conquest.

[2] Two coloured pillars, transported from Egypt to France, confirm the above reading, and increase the probability that the king mentioned by Manetho is identical with the Pharaoh whose monumental name is *Osortasen*. (*Précis du Syst. Hiérogl.* p. 197, et seqq.)

[3] See First Kings, chap. xiv. ver. 25, 26.

These results are supposed to have received a remarkable confirmation from the Genealogical Table of Abydos. This interesting monument was disinterred by Mr Bankes in 1818, while excavating for the purpose of obtaining an accurate ground plan of the extensive ruins of Abydos; and, soon after his return to England, he caused it to be lithographed, and copies to be distributed to different persons both in this country and in France.[1] One of these accompanies Mr Salt's *Essay*, which, in fact, was edited by Mr Bankes. A design of the Tablet was also made by Caillaud, but it is exceedingly ill executed, and, in the first or uppermost row of royal names, a cartouche is wanting. This important and interesting monument is composed of three rows of royal names, each row containing twenty-six; and the two upper rows exhibit the names of kings, arranged in the order of immediate succession, to perform a propitiatory act in favour of Ramses III. whose name and prænomen repeated occupy the whole of the last row. That the names in the two upper compartments present an immediate succession of kings, is rendered certain by other monuments which are particularly referred to by Rosellini. The names in this tablet are arranged in retrograde order from the right to the left, so that the fifty-first scroll, reckoning from the commencement, is the last of the series, whilst the fifty-second contains the proper name of that king whose prænomen is included in the scroll immediately preceding; and the first of the upper compartment on the right is of course the most ancient of all these kings. With the forty-first scroll commences the series of kings belonging to the eighteenth dynasty; the six preceding rings to number thirty-five contain the seventeenth dynasty of Theban Pharaohs, which was composed of the same number of kings; and in the five scrolls to thirty we should have read the names of the five kings who composed the sixteenth dynasty, if the characters had not been obliterated by time; but two of these have fortunately been preserved by other monuments. In the second compartment there still remain three scrolls (the 29th, 28th, and 27th), which, with the twenty-six of the first or uppermost row, form the names of twenty-nine kings, who must have preceded the accession of the sixteenth dynasty. The chronological Canon of Manetho does not give the number of kings who belonged to the fifteenth dynasty; it merely informs us that this dynasty was Theban, and lasted two hundred and fifty years. "Nel silenzio delle liste (di Manetone)," says Rosellini, "viene opportunissima la Tavola di Abydos, la quale io credo fuor d'ogni dubbio darci, in questi ventinove cartelli, l'esatto numero dei re che formarono la dinastia xv."[2] The learned Italian then states the grounds on which he was led to form this opinion; but if he be right in ascribing all these twenty-nine names to the fifteenth dynasty, it will follow that the average duration of each reign of that dynasty was only about eighty years and a half, which is considerably below the average duration of a reign in other dynasties of which complete lists have been given. This monument has suffered severe injury from time. In the first or uppermost compartment, twelve scrolls have been entirely and two of them partially effaced; in the second, eight have been totally obliterated; and in the third, three have been destroyed, four rendered illegible, and one partially injured. M. Klaproth has given it as his opinion that the Table of Abydos, instead of being read horizontally from right to left, should be read perpendicularly from right to left, in columns of two lines;[3] but although he has marked his copy of the monument, so as to indicate such a mode of interpretation, he has not ventured to exemplify his suggestion; and a very careful examination of the tablet has convinced us that this idea is erroneous. The repetition of the name and prænomen of Ramses (*Amun-mai-Ramses*), each thirteen times, in the third row or compartment, excludes such a supposition. But there can be no doubt whatever that the ordinary hieroglyphics in the two vertical columns on the left, containing the propitiatory act, are to be read perpendicularly, from the top to the bottom, beginning with the column towards the right.

Hasty, premature generalization formed the prominent defect of M. Champollion's mind. The importance of the monument discovered by Mr Bankes cannot well be estimated too highly; but we are not yet perhaps in a condition to appreciate its full value. M. Champollion, however, assuming a tone of confidence, which, on a subject of this nature, is worse than ludicrous, boldly laid it down, first, that his investigations had been confirmed, in the most remarkable manner, by the monument of Abydos; secondly, that, as far as these proceeded, they had established the accuracy of the royal chronological Canon of Manetho, preserved by Julius Africanus, Josephus, and Eusebius, a record which the learned in their ignorance had contemned as unworthy of credit; and, thirdly, that by his researches, taken in conjunction with the Table of Abydos, the Canon of the high-priest of Heliopolis[4] had

---

[1] Well might Mr Bankes take as a motto the words of Iamblichus, Και το ἐν Αβυδῳ ἀποῤῥητον δειξοι, "And he will publish the secret of Abydos."

[2] "E del mio credo ecco le prove," says the learned Italian. "La dinastia xiv. comprende settantasei re di origine *Choiti*. Dico pertanto non esser probabile che, nei rimanenti ventinove cartelli del quadro di Abydos, consumato il numero, taciuto da Eusebio, dei re della dinastia xv., si possano comprendere ancora alcuni re della xiv. Poichè esprimendo questo quadro una specie di prighiera in favore di Ramses III. per ordine, o ad onoranza del quale fu scolpito un tal monumento, trovasi convenientissimo che a pregar s'introducano i soli re delle familie Tebane, che con lui ebber commune la patria e verisimilmente la discendenza. Nè sarebbe credibile che sovrani di una altra famiglia, qual fu la Choite, la quale lungamente interruppe il regno delle familie Tebane, cominciato fino dalla dinastia decimaprima, fossero ammessi in comunione di prece a favore di un re Tebano. Imperocchè il cangiamento delle dinastie fu quasi sempre operato, in tutti i tempi e presso tutti i popoli, per civili discordie e per violenze; e sempre partorì negli offesi, odj implacabili e lunghi. I re poi della dinastia xv. regnarono dugento e cinquant'anni. Dato pertanto un numero approssimativo di re per riempier questo spazio, non resterebbero, dei ventinove nomi della Tavola di Abydos, altro che pochi da ascriversi alla dinastia xiv. la quale ebbe settantasei sovrani. E perchè poi se qualcuno di loro in questo quadro fu ammesso, sarebbero tutti gli altri rimasti esclusi? I limiti della Tavola di Abydos non erano fissati da alcuna legge. La ragione pertanto non consente, o che i Choiti vi avessero parte, o che della lor numerosa famiglia alcuni pochi soltanto si ammettessero." (*I Monumenti dell' Egitto*, tom. i. part i. pp. 152, 153.)

[3] "Au lieu de lire ce monument horizontalement de droite à gauche, comme M. Champollion l'a fait, il ne nous paraît donc nullement douteux que ses lignes doivent se suivre perpendiculairement, et aussi de droite à gauche; c'est-à-dire, par colonnes de deux lignes." (*Examen Critique*, p. 173.) M. Klaproth adds, "Mon intention n'est pas de donner ici *une plus ample explication du monument d'Abydos*, mais je crois que *l'examen le plus leger* suffit pour démontrer que M. Champollion *s'est complètement trompé sur la direction dans laquelle ces lignes doivent être lues.*" (P. 174.) This is a great deal too *tranchant*, especially considering that it is not accompanied with a single example of the method of reading proposed, which, in fact, will on trial be found to be an entire delusion.

[4] This celebrated Egyptian priest, who was a native of Sebennytus, flourished in the reign of Ptolemy Philadelphus, about 260 years before our era. He discharged the functions of sacrificer, and keeper of the sacred animals, in the temple of Heliopolis, where

Champollion, &c.

been verified in almost every particular. But there are several weighty considerations, which render it impossible for us to acquiesce implicitly in these conclusions.

And, first of all, the Table of Abydos differs in many most essential particulars from the royal Canon of Manetho. In the eighteenth dynasty, for instance, Manetho has *three* queens, whilst the Table of Abydos has *not one*;[1] and other discrepancies of equal magnitude might easily be pointed out. But our objections strike deeper, and apply much more to principles than to details. The Table of Abydos, with which M. Champollion began his defence of the chronology of Manetho, is the foundation upon which his disciples and followers, including Rosellini, still in a great measure build. We do not object to Manetho, that if his chronology be right, that of Herodotus, Diodorus, and Eratosthenes must be wrong. Neither would we reject it because, if all his dynasties existed, and if he were accurate in every point, as M. Champollion contended, we might give the chronology of Moses to the winds. Truth is our first object; and if it had been proved to be on the side of the high priest of Phtha, we should not have hesitated a moment to join his standard. But the inconsistencies, not to say contradictions, of which this high priest has been guilty, and the improbable, nay incredible, stories which he relates, render his honesty questionable, and accuse his judgment of positive imbecility. Manetho, however, has had his supporters amongst chronologers. If the system of collateral dynasties, so ingeniously and at the same time so erroneously imagined by Marsham, should be revived, the assistance of Manetho might again be required. Even Fréret, whilst he contended against Newton, where Newton was not in his strength, did not disdain to invoke that assistance. It is not the less true, that the learned in general have condemned the chronology of Manetho as erroneous and untenable. But in M. Champollion's speculations we have all at once a new defence set up for the high priest of Phtha. By the results of a double discovery, that of the long-lost key of the Egyptian hieroglyphics, and the disinterment of a new monument containing a catalogue of the Egyptian kings, predecessors of Ramses III. the royal Canon has been replaced within the pale of history, and Manetho proved to have been accurate in all his statements.

But this assertion, though very confidently made, has not served to overcome our incredulity. Our objections to Manetho's chronology are numerous. It would be nothing to us if M. Champollion had found the Hermetic books from which Manetho affirmed that he had made his extracts. We do not deny that the latter copied documents which existed in his time, and which the zeal and success of future inquirers may, perhaps, prove to exist at present. We allow that he quoted from the records of the priests; but we dispute the authenticity of those records. We hesitate not to believe Herodotus when he tells us that the priests of Egypt communicated to him their archives. We doubt not the word of this honest, though somewhat credulous historian, when he says that the wooden images of three hundred and forty-one pontiffs, who had succeeded each other, from father to son, had been exhibited to him by the priests. We only contend that the archives were forgeries, and that the images, like some other images, were the fabrications of fraud and imposture. Three hundred and forty-one descents, in unbroken succession, would be nearly as great a miracle as any of those which the legislator of the Jews, in preparing the deliverance of his countrymen, performed in Egypt; and, even if this difficulty were overcome, all chronology would be disturbed by an hypothesis which, taking the ordinary average of human life, and allowing thirty-three years for a generation, involves a period of rather more than eleven thousand years. Nor is this all. It would seem that, in every separate district of Egypt, the priests had distinct and totally different records. How shall we account otherwise for the very different statements of Herodotus, of Manetho, of Eratosthenes, of the author of the Old Chronicle, and of Diodorus Siculus? The Greeks were clearly made the dupes of these falsified archives, and now the moderns are to be duped by them in their turn. But if the archives of the Egyptians plainly and positively contradict each other, as it is manifest from the testimony of the Greeks that they do; if the internal evidence of these records show that one is not more worthy of belief than another, as Sir William Drummond has most conclusively proved in the second volume of his *Origines;* to what purpose, unless it be to gratify curiosity, can they be reproduced at the present time? It would be no answer to this that M. Champollion had found the very records themselves which Manetho copied, and in which a lamb is said to have spoken in the time of Busiris; for we should still contend that these records, like those shown to Herodotus, and those explained to Diodorus Siculus, were mere fabrications forged by the priests of Egypt.

But whilst we distrust the authority of Manetho as founded on documents unworthy of credit, and contend that the coincidences discovered in the Table of Abydos cannot make that authority either better or worse than it was before, we are at the same time prepared to admit that M. Champollion has done much to prepare the way for a more extensive acquaintance with the monumental records of ancient Egypt. That he has pushed his conclusions a great deal too far, is undeniable; that when he adopted new opinions he seldom or never took the trouble to retract his old ones, or explain why he had abandoned them, is certain; that, in his interpretations, a sign sometimes represented one letter, sometimes another, has been indisputably established by M. Klaproth; and that too much still rests on his unsupported authority, is unfortu-

---

he officiated as high priest of Phtha. Of his history of Egypt, which was written in Greek, some fragments only are extant. M. Klaproth seems to think that he has given the true names of the Egyptian monarchs, and that the series of Egyptian kings extracted from the monuments should generally be conformable to the catalogue given by Manetho. "On ne peut donc pas douter," says he, "qu'il ne nous ait conservé les véritables noms des monarques Egyptiens, et non pas, comme M. Champollion le dit, par simple hypothèse, des noms en partie vulgaires. Toute série des rois d' Egypte, qu'on parviendrait à extraire des monumens, à l'aide de l'alphabet phonétique, doit être généralement conforme à celles que donne Manéthon, au risque de paraître conjecturale à la critique. Les décisions arbitraires ne sont pas des preuves en matière d'histoire; ce qu'on y avance doit être démontré." (*Examen Critique*, pp. 171, 172.) This must not be mistaken. Manetho can only be considered as a standard in regard to what was believed or represented by the priests; in other respects, his statements must be liable to every objection which can be competently urged against the records from which he copied, or the authorities upon which he relied.

[1] "Allowing to M. Champollion," says Sir William Drummond, in a letter dated Naples, 27th April 1827, addressed to the author of this article, "that he reads and comprehends the hieroglyphical monuments of the Egyptians as well and as accurately as he does the *Moniteur*, or the *Gazette de Paris*, I should still hesitate before I admitted his testimony in favour of Manetho. I have not seen his book on the chronology of Egypt; but I have had in my possession a very accurate copy of the Table of Abydos, and I have examined it with the assistance of one of the most devoted of M. Champollion's admirers. That gentleman pointed out to me several names, which, he said, were those of kings of the eighteenth dynasty. But I inquired in vain for dates. Perhaps M. Champollion has since discovered them, and can tell us whether Josephus, or Julius Africanus, or Eusebius, be right, or whether all three are wrong." We suspect M. Champollion never made such a discovery.

Champollion, &c.

Champollion, &c.

nately beyond dispute. Considered in one point of view, he was little better than a brilliant empiric. Instead of cautiously working out his conclusions from fixed and settled premises, he dashed off conjectures which sometimes dazzled by their ingenuity, and at other times overcame all objections by their extreme felicity, but which, upon many occasions, were extravagant and empirical in the highest degree. In a subject beset with difficulties of the most formidable kind, he refused to admit that to him any obstacles were insuperable. Signs at one moment assumed a phonetic, at another a symbolic or ideographic power, as the occasion seemed to require, at the fiat of this hieroglyphical conjuror; when he happened not to find a Coptic word suited to his purpose, he scrupled not to invent one; and, with the strongest adverse facts staring him in the face, he persisted to the last in asserting the almost unlimited applicability of his alphabet. On several occasions, indeed, he acted as if he wished it to be believed that he read and comprehended hieroglyphical inscriptions, and even enchorial texts, with as much facility and accuracy as he did the *Moniteur* or the *Gazette de Paris.* Of this he gave a striking but most unfortunate exemplification in the affair of the papyrus in the collection of M. Sallier at Aix; an affair which, very soon after its occurrence, was placed in its true light before the public by the author of this article, in a journal which he then conducted. M. Champollion remained two days at Aix;[1] but it was not until the evening of the second day that a packet of papyri was placed in his hands. No matter for this; time and labour, which are so necessary to other men, the intuitive penetration of M. Champollion enabled him to dispense withal. In a single evening he ascertained the contents of all these manuscripts, and decided off-hand that the third, of which the first pages were wanting, was "a real historical treasure," containing the praises and exploits of Rameses the Great, or Sesostris, in the form of a kind of dithyrambic dialogue between the gods and the king. He also read, or rather pretended to read, the names of fifteen conquered nations, amongst which were mentioned the Ionians (*Iouni* or *Iavani*), the Lycians (*Louka* or *Louki*), and also the Ethiopians and Arabs; and he further informed us that the manuscript spoke of the chiefs of these nations, "led into captivity, and the tributes imposed upon their countries." All this was the work of one evening; all this, if M. Champollion may be in aught believed, was deciphered from a manuscript papyrus written in a character the signs of which are but imperfectly ascertained, in a language of which it is only known that the Coptic, in its various forms or dialects, bears to it nearly the same relation as the Italian or Spanish does to the Latin, or the modern to the ancient Greek.[2] Empirical pretension like this was surely more than sufficient to alarm the most credulous believer, and to excite suspicion and distrust in regard to all that he had actually accomplished.

In contradistinction to all this haste and empiricism, we shall here introduce the deliberately-expressed opinion of a sober and patient inquirer, formed after twelve years' laborious practice in the application of the phonetic system. "With regard to the translation of hieroglyphics," says Mr Wilkinson, "M. Champollion must allow, no one is yet sufficiently advanced in the language of ancient Egypt to enable him literally to translate an inscription of any length, or moderately complicated, though a general meaning may frequently be obtained. Time will no doubt do more, and we may hope to see this language interpreted with the same facility as many with which we have long been acquainted. But the steps must be slow and cautious; and the only mode of convincing those who still adhere to a contrary opinion, is to trust little to conjecture, or at least to state an uncertainty, whenever it exists; to admit and correct errors when discovered; and to settle a fixed rather than a temporary interpretation to the groups which will answer to their meaning whenever they occur."[3] These are the words of truth and soberness, and, we may also add, of honesty.

Much of this extravagance and folly, however, is to be attributed to M. Champollion's unlimited confidence in his alphabet, enchorial as well as hieroglyphical, and his consequent adoption of the principle that the Egyptian system of writing hitherto regarded as almost wholly consisting of symbols or emblems of ideas, was, on the contrary, composed of signs, a large proportion of which expressed merely the sounds of words in the spoken language of ancient Egypt. The consequence was, that he disregarded the tentative or experimental method of investigation, to which Dr Young was mainly indebted for the discoveries which have given such lustre to his name; believing his alphabet an instrument of general if not universal applicability, he shrunk from the labour of the exhaustive process of hypothetical induction, by which the values of entire *groups* may be determined, notwithstanding their constituent elements remain unknown; and to this unfortunate misconception, or rather limitation, may be attributed all the inconsistencies into which he was betrayed in endeavouring, by means of his alphabet, to interpret signs which are not alphabetical. It was not by the enchorial alphabet, for example, that Dr Young was enabled to translate enchorial manuscripts, which, in fact, are not reducible to any alphabet, except in proper names; it was the *words* or groups themselves which he translated, with now and then only a hint from a letter or two. In regard to the sacred characters, M. Champollion has no doubt rendered it highly probable that the phonetic signs were much more extensively employed than Dr Young had at first imagined; but, on the other hand, he pushed his system to an extravagant length, and neglected that method of investigation so successfully exemplified by Dr Young, which, when systematically applied, must ultimately lead to certain results, because it is founded on the principle of a constant correction of errors and accumulation of evidence.

Even in deciphering proper names, which are incontestably written phonetically, the difficulty experienced is great, and the risk of error often incalculable. This arises from the capricious and arbitrary manner in which they are written; sometimes from the left to the right, at other times from the right to the left, most frequently up and down; whilst the elements of one word are often thrown together pell-mell, in such a way that unless the sound of the word were somehow known beforehand, it would be absolutely impossible to dispose or arrange the characters representing it in correct order; and where this previous knowledge is wanting, the chance of error must be very

---

[1] *Lettres écrites d'Egypte et de Nubie, en* 1828 *et* 1829, p. 21. "Cette trouvaille est immense," says he, "et ce manuscrit hiératique (the third) porte sa date à la dernière page. Il a été écrit, dit le texte, *l'an ix. au mois de Paôni*, du règne de Ramsès-le-Grand."

[2] No sooner did M. Champollion arrive in Egypt than he gave a fresh proof of his unhesitating decision. At eight o'clock in the evening he had an interview with the viceroy, who requested a translation of the inscription on the obelisks of Alexandria, which have three columns of characters on each face. The Frenchman at once undertook to gratify the viceroy's curiosity, and the whole, translated into Turkish, was delivered to him *next morning*.

[3] Wilkinson, *Topography of Thebes*, p. 57.

Champollion, &c.

great, and the probability will therefore be, either that a barbarous word will be involuntarily formed, or that one very different from that which is actually formed will be evolved. This observation applies rigorously to all the words of the Egyptian language, and even extends to such proper names of gods and kings as are not derived from the Greek or Latin, and the exact forms of which have not been transmitted to us by the ancient authors. Let us suppose, for example, that, by means of the phonetic alphabet, the following groups of literal characters are recognised in an inscription :

(1.) $A_{P}E^{K}_{L}$ (2.) $S^{T}_{M}T$

A person skilled in the interpretation of hieroglyphics would readily discover that No. 1 is the name of *Cleopatra*, which, in fact, is so written in a ring or cartouche contained in an inscription of Philae, published by Mr Salt; and that No. 2 is the name of *Toutmosis*, which is otherwise well known. But if this were not so, and if we were devoid of all extrinsic information or assistance, the doctrine of probabilities has no formula to exhaust the number of combinations amongst which an interpreter might fluctuate before discovering the true collocation; and, what is more, he could never be absolutely certain that he had discovered it at all.

Another and still more formidable obstacle to be surmounted, is the incomplete and imperfect manner in which the Coptic represents the ancient Egyptian, notwithstanding it may, in one sense (as we have already shown), be considered as a precious remnant of that language. Hence, supposing that the forms and values of the letters were perfectly determined, that their arrangement was well understood, that, in a word, we could spell syllables and distinguish words with as much certainty and precision as in the improved alphabets of the West, there would yet always remain one difficulty, over which genius itself could not triumph, namely, to discover the signification of the words, when it is not known by tradition or otherwise. Some of the misjudging admirers of M. Champollion have talked of his labours in deciphering the hieroglyphical inscriptions, as if he had been accustomed to read the most ancient legends with the greatest facility and certainty; and, from a number of circumstances, it is but too obvious that he himself evinced no disposition whatever to disturb this belief in the omniscience of his genius for interpretation. But the interests of truth require that so gross a delusion should be dissipated; and this cannot be better accomplished than by stating, as M. Klaproth has done, the real difficulties of the problem which he undertook to resolve, and tracing a clear line of demarcation between the province of rational inquiry, and the fantastical domain of archæological empiricism.[1]

In fact, the discoveries of M. Champollion apply only to a limited number of the hieroglyphical signs; that is, to proper names, and some other words incapable of symbolization, which are expressed by means of an alphabet in some measure resembling that of the Semitic languages, in which the consonants of words are written sometimes with only part of the vowels, and frequently without any vowel whatever. But in deciphering these names and epithets M. Champollion had an excellent guide in the lists supplied by the tables contained in the Egyptian Dynasties of Manetho and other ancient authors; he knew beforehand what he had to seek for, and he was not a person to be long in finding the precise thing which he wanted. But, notwithstanding this, he is by no means at one with himself as to the extent of his discovery. In the introduction to his *Précis*, he affirms "that his hieroglyphic alphabet applies to the royal hieroglyphic legends of *every epoch*, that the discovery of the phonetic alphabet is the true key to the whole hieroglyphic system, and that *at all epochs* the ancient Egyptians employed it to represent alphabetically the sounds of their spoken language." (P. 11.) But at the commencement of the eighth chapter of the work, he contradicts this dogma in the most explicit manner. "I admit," says he, "that we do not yet know *with any degree of certainty* whether the inscriptions and hieroglyphic texts, in which are found Egyptian words expressed phonetically, belong to the times of the Pharaohs (*remontent aux temps des Pharaons*), kings of the Egyptian race; or only to the Greek period, as the inscription of Rosetta, the obelisk of Philae, and the temples of Ombos and Edfou; or merely to the Roman period, as the obelisks of Albani, Borgia, Pamphilius, Barberini, that of Benevento, part of the edifices of Philae, and the temples of Esneh and Denderah." With respect to the alleged universality of the phonetic mode of writing "at *all* epochs," it is therefore evident, first, that M. Champollion flatly contradicts his own fundamental proposition; secondly, that this proposition being at variance with all that the ancient authors, particularly Clemens Alexandrinus, have stated respecting the different kinds of Egyptian writing, it cannot be established by their authority; and, thirdly, that M. Champollion has not only not demonstrated its truth, but that, in the actual state of our knowledge, such demonstration appears to be impossible.[1]

---

[1] "L'intelligence que nous avons des monumens littéraires des Grecs et des Romains est venue jusqu'à nous par une tradition non interrompue ; nous possédons la plus grande partie des livres de ces peuples avec une suite d'explications et de commentaires destinés à en dissiper les obscurités, et pourtant à l'époque de la renaissance des lettres, que d'immenses travaux n'a-t-il pas fallu faire ? combien d'hommes patiens et laborieux ont usé leur vie pour achever d'éclaircir ce que les anciens textes présentaient à chaque pas d'embarrassant, d'obscur ou d'inintelligible pour les modernes ? Quand une inscription grecque se présente à nous pour la première fois, quelle habitude ne faut-il pas pour la lire ; la restituer, en expliquer le contenu, développer les circonstances auxquelles elle se rapporte ? La langue que de profonds philologues ont si bien approfondie est ici la moindre difficulté, mais les choses, les faits, les particularités de date ou de localité, les institutions, les titres des magistrats, les usages, les préjugés, les opinions religieuses ; tout enfin n'exige-t-il pas de la part de nos savans une rare application et une sagacité merveilleuse ? Cependant que de travaux préparatoires n'a-t-on pas faits pour diminuer leur peine ? que de recherches, de tables, de dictionnaires n'a-t-on pas accumulés depuis trois siècles pour éclairer tout ce qui fait partie du domaine de l'archéologie ? En Egypte, au contraire, une vaste solution de continuité, un abîme immense sépare les événemens d'autrefois de la critique des tems modernes. *Toute la littérature a disparu avec la religion, la philosophie, et le système entier de la civilisation ; les livres, s'il y en eut jamais, ont été complètement anéantis ; les papyrus, que quelques personnes peu éclairées prcnnent pour des livres, n'offrent qu'une perpetuelle répétition des mêmes formules toujours relatives au même sujet, la mort et ses consequences.* Les inscriptions hiéroglyphiques sont les seuls livres que nous aient légués les Pharaons ; mais là se présente à l'instant cette double difficulté, insoluble si l'on ne parvient à la diviner ; *tout est inconnu dans ces inscriptions la langue et les faits, l'écriture et le fond des choses.* On arriverait à l'intelligence du contenu si l'on avait à sa disposition l'explication des mots, et *vice versa* on reconnaîtrait aisément la valeur des signes si l'on savait d'avance le sens qu'ils représentent. Mais pour opérer ce dernier prodige, il faudrait recréer à-la-fois l'Egypte des Pharaons avec son système idolatrique, les noms des dieux et de toutes les choses sacrées, les détails du culte et toute la série des opinions philosophiques, la vie civile avec ses innombrables particularités, et, par-dessus tout cela, la prononciation matérielle de tous les mots qui s'y appliquaient, leur synonymie et leurs nuances, et la valeur spéciale d'une foule d'expressions, de figures, de métaphores, d'emblêmes, d'attributs, que l'usage chez une nation vivante introduit, renouvelle et modifie sans cesse. Ce n'est pas la critique humaine, *c'est l'intuition de la divinité* qui pourrait opérer un tel miracle ; et l'on voudrait qu'un savant, de quelques facultés qu'on le supposât doué, eût fait seul, en peu d'années, ce que la raison et le bon sens démontrent impossible à des générationes littéraires qui se succéderaient pendant des siècles."

We could have wished to follow up these observations by stating concisely the results of the searching analysis by means of which M. Klaproth has reduced to their real dimensions the discoveries of M. Champollion. But after what has already been said, we must content ourselves with stating generally, that different and often incongruous values are arbitrarily assigned by him to the same character, without any previous notice or explanation; that the image of an *eye*, for instance, which was originally set down as a phonetic sign of S, has been successively employed to represent A, E, and O; that, in numerous other instances, changes still more arbitrary have been made; that we are left in equal ignorance of the process by which the original values were pretended to have been ascertained, and of the reasons which induced the author to abandon them; that he attributes values to signs which are not contained in his alphabet, and of which no account or explanation is given anywhere else; that he is frequently betrayed into incongruities and inconsistencies which impeach his judgment, and would even warrant a suspicion of bad faith; that in the interpretation of ideographical characters or symbols, he adopted conjectures and fancies of his own, which, however ingenious, are wholly unsupported by evidence, or even by probability; that, for instance, the symbolical group which, as far as page 265 of his second edition, is rendered "the goddess *Saté*," becomes suddenly converted into *Tmé*, and this name continues to the end of the work, though, in the plates, the goddess appears under the name of *Smé;* that changes of a similar description occur in many other words, and almost invariably without any previous intimation; and, lastly, that not a few of his pretended discoveries are mere conjectures and imaginations, sometimes exceedingly ingenious, seldom altogether extravagant, but, in as far as evidence is concerned, not more rational nor better founded than the cabbalistical reveries of Kircher or the fanciful vagaries of Palin. For the details and demonstrations of these anomalies, however, we must refer to the *Examen Critique* itself, one of the most masterly works of criticism that has yet appeared on the subject of which it treats, and which is well deserving of the most attentive perusal.

It now only remains, under this head, to notice the French and Tuscan expeditions to Egypt; the former undertaken at the urgent solicitation of M. Champollion, who, as early as the month of April 1827, had digested the plan of such an enterprise, and both having for their common object a re-examination of the monuments, as well as a more extended application of that method of interpretation which had originally been divined in this country, but which was subsequently enlarged and improved in France. The discovery of the phonetic alphabet, generally regarded on the Continent as the basis of the graphic system of Egypt, promised to the historical sciences an ample harvest of new facts, the more interesting and important, as these might perhaps fill up with some degree of certainty the large blanks in the first pages of human annals. But, to answer this expectation, it became indispensable that the new lights which had been acquired on the subject of hieroglyphical writing should be applied to the innumerable inscriptions engraved on all the monuments, public and private, of Egypt and Nubia; and it was with this special object that the governments of France and Tuscany appointed each a commission, the former directed by M. Champollion, and the latter by Signor Rosellini, professor of history and antiquities in the university of Pisa. With M. Champollion were associated A. Bibent, architect, and Nestor l'Hôte, Salvador Cherubini, Alexander Duchesne, Bertin the younger, and Lehoux, as draughtsmen; with Professor Rosellini, Gaetano Rosellini, architect, Dr Ricci, Giuseppe Angelelli, and Raddi, professor of natural history, with an assistant. M. Champollion set out from Paris on the 16th of July 1828, reached Toulon on the 24th, and set sail for Egypt on the 31st of that month, accompanied by the members of the Italian commission. During the remainder of 1828, and the whole of 1829, the members of both commissions were unremittingly occupied in exploring the antiquities scattered along the valley of the Nile, from the Mediterranean as far as the second cataract, and in accumulating those treasures which, now that Champollion is no more, Signor Rosellini is giving to the world in his splendid work, entitled *I Monumenti dell' Egitto et della Nubia*, of which a considerable portion has already (1835) appeared, accompanied with engravings equally remarkable for their accuracy and beauty.

The indefatigable travellers, never once losing sight of the determinate object of their enterprise, and exploring, one by one, the monuments still extant on both banks of the river, or on the different points of the valley of the Nile, transferred to their portfolios all kinds of positive documents furnished by each ruin. Every bas-relief and every inscription, whether establishing an historical fact, a point of religious belief, or a usage of ordinary life, was designed or copied with the most scrupulous care; and in the work of Signor Rosellini these bas-reliefs have been reproduced by faithful designs, with all the details and colours exhibited by the originals, as often as this appeared necessary either to illustrate the subject, or to convey a just idea of the compositions of art which adorn the monumental remains of ancient Egypt. The result has been an accumulation of not less than fifteen hundred designs, together with a particular description, drawn out on the spot, of every monument in Egypt and in Nubia, containing the subject of each bas-relief, the detail of the decorations, which are always significant, and copies of the accompanying inscriptions, whenever the texts presented any subject of historical interest.

In a climate like that of Egypt, the fatigue incident to such an undertaking must have been trying even to the most robust constitutions; and it is not to be wondered therefore that some of the travellers should have sunk under it.[2] M. Champollion died soon after his return to

---

[1] It may be proper to state here a fact, which seems to be decisive of the question. The phonetic alphabet consists of about *a hundred and thirty-four* characters, more than the half of which are purely conjectural. But supposing the whole to have been completely ascertained, the absolute number of distinct hieroglyphics on the monuments is, according to Champollion's computation, 864, whilst Zoega makes it 958; and if from the former we deduct 134, there will remain 730 signs, the greater part of which, it is certain, *are not employed phonetically*, and their real values as yet altogether unknown. With this fact before him, it is not easy to conceive how M. Champollion could venture to affirm that his phonetic alphabet applied to the royal hieroglyphical legends of *all periods;* that it was the *true key* to the *whole* hieroglyphical system; and that the ancient Egyptians employed it, *at all epochs*, to represent alphabetically the sounds of their spoken language.

[2] M. Bibent, the architect, was obliged, from bad health, to take leave of his associates amidst the ruins of Memphis, and to return to France, where he soon afterwards died. Professor Raddi died at Rhodes, when on his way back to Europe. The assistant of the latter had sailed for Leghorn some months before, but sunk during the voyage under the effects of the fatigue and labour to which he had been exposed. Lastly, Dr Ricci had the left side of his body paralysed in consequence of the bite of a scorpion at Thebes.

France, though not until he had prepared a Hieroglyphic Grammar, which will doubtless contain the ultimate conclusions established by himself and his learned associates; and it is to Signor Rosellini that we must now look for the exposition and illustration of all that was collected during the time that the commissions were occupied in exploring, designing, and describing the monuments of Egypt and of Nubia. Nor, judging from the portion which has already appeared, could the work of digesting and arranging the materials thus accumulated have fallen into abler or more competent hands. The designs are in every view worthy of the subject, and will not suffer much by a comparison with those contained in the French national work, in point of execution, whilst in all other respects they are greatly superior. As to the literary part of his undertaking, it is composed in a spirit of perfect candour and liberality, evincing not only the acquirements, but also the accuracy, of an accomplished scholar, and uniting to great erudition the utmost anxiety to render justice towards all his colleagues in this branch of inquiry. With regard to M. Champollion's *Lettres écrites d'Egypte et de Nubie en* 1828 *et* 1829, it would have been better for his fame perhaps had these hasty productions never appeared. Signor Rosellini attributes the publication and reprint of the *Lettres* to a speculating bookseller in Paris; and states, what is no doubt the truth, that M. Champollion, if he had lived, would have altered and retracted much that is contained in them. But it is nevertheless obvious that they were originally intended for publication; they were evidently written for effect, to keep up the excitement in favour of his project; in short, they were calculated for the meridian of Paris.

VIII. SYSTEM OF SPOHN AND SEYFARTH.

The conflicting results at which both ancient and modern writers had arrived respecting the contents of the Egyptian texts, as well as the kind and description of characters in which these had been expressed, were well calculated to stagger an ordinary reader, and to seduce him into complete scepticism as to the possibility of the hieroglyphical inscriptions being ever deciphered and interpreted. According to Horus Apollo, these mysterious writings contained obscure indications of things sacred and profane; according to Clemens and Plutarch, moral sentences; according to Hermapion, as quoted by Ammianus Marcellinus, the praises of kings; according to Kircher, cabbalistic, metaphysical, and theosophistical dogmas; according to Pluche, matter connected with meteorology, astronomy, and the division of time; according to Denon, the rules of husbandry; and, according to the author of the work *De l'Etude des Hiéroglyphes*, a version of the psalms of David. Prior to the researches of Dr Young, nothing deserving the name of investigation had been attempted, and one bold or fanciful conjecture was merely displaced by another perhaps still more extravagant. It was therefore high time that the subject should be either abandoned as hopeless, or that conjecture and hypothesis should give place to rational inquiry conducted on ascertained or demonstrable principles. Dr Young felt this, and, starting from a point entirely new, succeeded, by means of collocation, comparison, and tentative or experimental investigation, in fixing the values of certain characters and groups, and, generally, in tracing out the line or direction which inquiry ought to pursue. M. Champollion followed close in his footsteps, and, enlightened even by the errors of his predecessor, unfolded a method of interpretation, the soundness of which, at least within certain limits, has been established by the truth of the results it has evolved.

But not long after these interesting discoveries had been made known to the world, a system was imagined in Germany which, as far as we are able to comprehend it, seems to proceed on assumptions at once ingeniously original and demonstrably unsound. This system was first obscurely revealed in the work of Spohn *De Lingua et Litteratura Veteris Ægypti*, and afterwards more fully expounded in the splendid work of Professor Seyfarth, entitled *Rudimenta Hieroglyphices*,[1] which appears to have been favourably received by his countrymen. Spohn died young, without completing his investigations or maturing his system; but Seyfarth undertook to do both, and, if we may credit a writer in the Leipsic Journal, he has succeeded so well that, besides establishing the truth of his own method of interpretation, he has demonstrated the utter fallacy of the *pretended* discoveries of Dr Young and M. Champollion. The investigations begun in England, and so successfully prosecuted in France, were by no means calculated to find favour with the Germans, who seem to have a natural distaste for what may be acquired without labour or understood without effort; and hence the very simplicity of the principles upon which these inquiries were conducted, served to confirm their habitual prejudices, and to fortify their understandings against the conviction naturally arising from the results actually obtained. Dr Young's researches had no flavour of mystery about them; and those of M. Champollion were communicated in language singularly remarkable for the most transparent perspicuity. The lovers of the profound, therefore, saw to the bottom at once, and because they did so, they concluded that the waters were shallow. The question at issue, however, is not so much one of erudition as of evidence, of which the German scholars and orientalists are not the only competent judges; and we think we shall be able to show that if Young, Champollion, and others who have followed in their footsteps, have done but little, Spohn, Seyfarth, and their disciples, have literally done nothing at all.

M. Seyfarth modestly professes himself to be a mere expounder of the doctrines of Spohn, and candidly admits his obligations to the work of that distinguished scholar, not only for the theory proposed, but for the greater part of the materials by which it is illustrated. "Quod sibi videtur hic libellus rationem tradere, qua hieroglyphica scripta legenda sint; id cujus nomine adscribi debeat, tacere, maxime impium et invidiosum esset. Scilicet Spohnius, vir immortalis meriti, *omnia præparavit*, quæ ducunt ad intelligentiam etiam hieroglyphicorum. Quodsi concessum ei fuisset, pergere in vita, quam ingressus erat, plura Ægyptiorum scripta, inspicere, perlegere, inter se comparare, quod mihi contigit, non potuisset, sed debuisset leges etiam invenire, quibus hieroglyphica scriptura constat. Quæ quum ita sint, *velim hæ schedæ accipiantur, tamquam placita Spohnii*, vel tamquam fructus, qui ex segete ejus prodierunt, quem instauratorem litterarum Ægyptiarum veneramur."[2] The learned professor deserves credit for the manly candour of this avowal, as well as for the methodical distinctness with which he has stated the principles and doctrines of his master; and all those who take any interest in Egyptian literature can scarcely fail to be pleased with the very beautiful lithographic tables which adorn his *Rudimenta Hieroglyphices.* But here, unfortunately, our commendation must stop. The theory invented by Spohn and expounded by Seyfarth appears to us to proceed upon an erroneous assumption, to involve in its explication glaring absurdities, and to be incapable of ever leading to any true results.

---

[1] Gustavi Seyfarthi Prof. Lips. Rudimenta Hieroglyphices. Accedunt Explicationes Speciminum Hieroglyphicorum, Glossarium, atque Alphabeta; cum xxxvi. tabulis lithographicis. Lipsiæ, cIↄIↄcccxxv. in 4to.

[2] *Rudimenta Hierogl.* Introduct. § 2. In a note to the following section the author says, "Porro *integras inscriptiones demoticas* primus (Spohnius) interpretatus est." But of this bold assertion no proof whatever is produced; and even if Spohn had interpreted, in his own way, entire demotic inscriptions, his system is so groundless and untenable, not to say visionary, that a question of *priority* could not possibly be raised between him and Dr Young. The tentative method of interpretation so successfully exemplified by the latter has nothing in common with the imaginative transcendentalism of Spohn, and the methodical absurdity of Seyfarth.

The fundamental principles of the Spohnian theory are, *first*, that the hieroglyphical language is a *sacred dialect*;[1] and, *secondly*, that the hieroglyphical characters are not *letters*, but only *symbols* of letters.[2]

The first of these propositions, which is professedly founded on a statement of Manetho, quoted by Syncellus, is thus explained by Professor Seyfarth: " E verbo *dialecti*, quo linguam hieroglyphicam veteres insigniverunt, satis clarum est, hanc neque convenisse cum vulgari, neque diversam plane fuisse a Coptica. Differt autem *dialectus sacra* a Coptica, partim elementis seu *verbis*, partim *legibus grammaticis*. Inter dialectum autem *sacram et profanam* veterem Ægypti omnia intersunt, *quibus differt recentior oratio a veteri*, nationis cujusque magis subinde artium et litterarum humanitate eruditæ." Now, according to this definition, the language of Chaucer should be denominated the " sacred dialect" of English, in contradistinction to the " profane" dialect by which it has, in the progress of improvement, been displaced; and a similar title of honour should be conferred on the antiquated phraseology of our venerable countryman Gawin Douglas. But how, we would ask, are we to detect the existence of this " sacred dialect," or elder form of the Egyptian? All that remains of the ancient language of Egypt is preserved in the Coptic, of which there are still extant two dialects, the Memphitic and Sahidic, with a few words belonging to a third, called the Bashmouric. But of these three dialects the *most ancient* is undoubtedly the Bashmouric, of which scarcely a vestige can now be discovered; and hence the " hieroglyphical language" or " sacred dialect" of Spohn and of Seyfarth is a perfect nonentity. Not to dwell upon this, however, we may observe, that there is no such thing known as a " hieroglyphical *language*," the term " hieroglyphical" being applied only to a particular *method* of writing, and never to the *thing written.* The proposition of Seyfarth, therefore, involves an assumption which is contrary to the fact, and at the same time amounts nearly to a contradiction in terms. Secondly, since hieroglyphical inscriptions continued to be executed as late as the reign of Antoninus,[3] if the " sacred dialect" or elder form of Egyptian was alone employed in these texts, it follows that an antiquated dialect still remained in use, and co-existed with the more modern form by which it had been displaced. Thirdly, if one dialect was employed in hieroglyphical writing, it is at least equally probable that another was used in the hieratic, and a third in the enchorial. Lastly, Spohn and Seyfarth have equally misunderstood the statement of Manetho, quoted by Syncellus, in which the " sacred dialect," whatever it may have been, is expressly distinguished from the " hieroglyphical characters" which had been written in the time of Thoth, the first Hermes, " and which were taught after the transition from the *sacred dialect* to the Greek language." So much, then, for the first proposition, in support of which no proof of any kind is produced by Professor Seyfarth.

But the main pillar of the theory is the second proposition, namely, that the hieroglyphical characters are *not* letters, but *symbols* of letters. Remove this, and the whole fabric must at once fall to pieces. A letter is a character or symbol, representing either an elementary sound, or the simplest combination of elementary sounds. But what are we to understand by the symbol of a symbol of a sound? The symbol of a sound either represents a particular sound, or it represents nothing at all. If then a hieroglyphic be *not* a letter, but only the *symbol* of a letter, it follows that it is the representative of a representative, yet is neither that which it represents, nor the sign or symbol of the thing represented, namely, sound; in other words, it is merely the shadow of a shade. This fundamental principle or proposition, therefore, when taken by itself, would seem to be rather a *jeu de mots* than a statement of an elementary truth. But Professor Seyfarth labours to make himself intelligible; and, having narrowly examined his exposition, we shall endeavour, as distinctly as possible, to state the substance of his doctrine, or rather that of his master Spohn.

He admits that in every country, not excepting Egypt, the first attempts at writing consisted in rude delineations of material or physical objects; that, from the difficulty and inconvenience of this practice, men were soon led to abridge those delineations by putting, *per synecdochen*, a part for the whole, and by other devices; that as this pictural tachygraphy was incapable of representing changes of relation and qualities, as well as the sentiments and passions of animated beings, it soon came to be enriched with *symbols* strictly so called, that is, with arbitrary marks or characters employed to represent those ideas which had no sensible archetypes in nature; that, in the progress of time, all traces of connexion between the sign and the thing signified would be lost, and the characters, being applied to the spoken language, would become the representatives of words, or portions of words, as in the Chinese; and, lastly, that from accident, or the fortunate contrivance of a superior mind, some of these known characters would at length be appropriated to represent the elementary sounds of the spoken language, or, in other words, an alphabet would be invented and introduced. But, whilst he does not, and indeed cannot, dispute this gradual progression of the human mind from picture-writing to an alphabet, the first and greatest of all inventions, the finest result of the finest analysis, Professor Seyfarth at the same time contends that the Egyptians had passed all these different stages *before* they began to fabricate hieroglyphical characters; that, amongst them, alphabetical signs, instead of being the eventual offspring of picture-writing, through the intervention of kuriological and tropical writing, were in reality the parent of both these forms, primary as well as secondary; and that, in Egypt, *after* attaining the simplest and last refinement in the art of writing, they retrograded to the imperfect, obscure, and cumbrous methods which in every other country disappeared as soon as an alphabet had been invented.

According to Spohn and Seyfarth, the Egyptians as well as the Greeks received letters from Phœnicia.[4] But, if we are to give credit to these authorities, the former peo-

---

[1] This notion is founded on a statement of Manetho, quoted by Syncellus, *Chronograph.* p. 40, Paris, 1652, which is as follows: Μανεθω χρηματισας ἐκ των ἐν τῃ Σηριαδικῃ γῃ κειμενων στηλων, ἱερᾳ, φησι, διαλεκτῳ και ἱερογραφικοις γραμμασι κεχαρακτηρισμενων ὑπο Θωθ, του πρωτου Ἑρμου, και ἑρμηνευθεισων μετα τον κατακλισμον ἐκ της ἱερας διαλεκτου εἰς την Ἑλληνιδα φωνην, κ. τ. λ.

[2] The real author of this fancy is Cosmas Indicopleustes, a geographical writer of the sixth century, who gravely reports that Moses learned γραμματα ἱερογλυφικα, μαλλον δε συμβολα γραμματων. (*Cosmograph.* p. 161.)

[3] A learned countryman of Professor Seyfarth's, Dr Sickler, wrote a book to prove that the language concealed under the hieroglyphics is Hebrew, or, at least, a form of speech composed of the different Semitic dialects.

[4] " At *demonstrari* potest Ægyptios litteras accepisse a Phœnicibus, p. 15. The learned professor, however, has not thought it

Spohnian System.

ple must have made an extraordinary use of this invaluable acquisition. Instead of attempting to improve the invention, or to apply it directly to the purposes of writing, which it was so eminently calculated to facilitate, they did exactly the reverse, and immediately commenced embellishing, varying, and multiplying these elementary characters, as fancy or caprice happened to dictate. "Licuit cuivis calamo, cuivis cestro, variare hieroglyphica." Such is the broad and unqualified statement of M. Seyfarth; but how these arbitrary variations were to be rendered intelligible to any but the scribe, painter, or sculptor by whom they were executed, or even to *him* after the lapse of a considerable interval of time, the learned professor has not condescended to explain. It would seem, indeed, that nothing short of inspiration itself could enable any one to read and understand writing formed and executed in the manner here described. Yet the three kinds of Egyptian writing, now perfectly distinguished, were, it seems, the fortuitous results of this most extraordinary procedure, first imagined by Spohn, and afterwards zealously contended for by Seyfarth.

Clement of Alexandria informs us that those who were educated amongst the Egyptians learned three sorts of writing; firstly, the *epistolographic* or demotic; secondly, the *hieratic;* and, lastly, the *hieroglyphic.*[1] But Spohn and Seyfarth take it for granted that the *order of instruction* here indicated is also the *order of invention;* and, accordingly, they lay it down as a principle that the demotic is the basis upon which the whole superstructure has been reared, the original stem which the fancy or caprice of writers in time covered and adorned with a variety of branches. In plain terms, their notion is, that the hieratic has been generated by variations on the epistolographic or demotic, and the hieroglyphic by similar or analogous variations on the hieratic; and they contend that all these variations are *not* letters, but only *symbols* of letters (συμβολα γραμματων). Taking M. Seyfarth's assumption, therefore, that the original alphabetic characters were twenty-five in number, and supposing also with him, that each of these underwent thirty variations, in order to constitute the total amount of demotic characters, that the demotic underwent an equal number to form the hieratic, and the hieratic again an equal number to produce the hieroglyphic; we shall have 25 × 30 × 30 × 30 = 675,000 "symbols of letters," or 27,000 variations of every one of the twenty-five original alphabetic characters. This is M. Seyfarth's own calculation; and it is inconceivable how it should have failed to convince him of the utter extravagance and absurdity of his whole system. No critic, however ingenious or malicious, could have more effectually exposed it to ridicule than he has himself done. The total number of the Chinese characters, which are combinations of little more than two hundred elementary "keys," does not much exceed the number of variations (27,000) here supposed to have been made upon one original alphabetical character; yet, of all the languages, living or dead, that of China is the most difficult of acquisition, and to master it fully, so as to be able to write it with tolerable facility, is even to a native the work of half a life-time. But what shall be said of a language the graphic system of which must, upon this hypothesis, have embraced nearly 700,000 distinct characters, called "symbols of letters?"

There are data, however, from which a more direct and conclusive refutation may be deduced. Bruce, Zoega, and Champollion have each given approximate computations of the absolute number of hieroglyphics. From a somewhat superficial survey of the temples and other edifices of Egypt, Bruce reckons only 514; from a careful examination of the obelisks at Rome, and the monuments preserved in the museums of Italy, Zoega makes out 958; and, from a painful analysis of all the inscriptions which have been copied into the French national work *Déscription de l'Egypte,* and other publications, M. Champollion reduces them to 864. By taking a mean of the two last computations, 911, we shall probably make a pretty close approximation to the truth. If this, then, be added to the known heratic and demotic characters, it will be found that the total number of characters, in the three different kinds of Egyptian writing, does not exceed, if in truth it amounts to, 1200. Suppose it, however, 2000, or, if you will, 20,000, and still M. Seyfarth's case will not be improved; for, even on the last supposition, which is at least *ten times* more than the truth, the learned professor will have to account for 655,000 "symbols of letters," of which no trace can be discovered on the monuments.

Having thus unfolded the general principles of the theory of Spohn, M. Seyfarth next proceeds to classify the hieroglyphics. And these he divides into *emphonic, symphonic,* and *aphonic.* The *emphonic* are those which "suo ambitu integram litteram hieraticam pluresve describunt," and which "sistuntur pro situ litterarum in iis latentium, et ratione rerum quas significant." They are susceptible of transposition, variation, and abridgment, and may be affected by defective or superfluous writing, permutation of vowels or consonants, and by conjunction. The *symphonic* are those "quæ nonnisi cum aliis, sive singulis sive plüribus, elementa verborum vel litteras exprimunt;" that is, a sort of enclitic "symbols," significative only in combination with emphonics. They are of hieratic origin, but occur more frequently in the hieroglyphic than in the hieratic characters; and they are affected by permutation, position, order, conjunction, omission, and sejunction. The *aphonic,* "diversa sunt a litteris, magisque ad picturam quam scribendi artem referri debent;" in other words, they represent, either directly or metaphorically, not letters, but ideas, and are accordingly not phonetic, but ideographic symbols. They are divided into *mimetic,* "ipsæ rerum imagines;" *tropic,* "quæ imagine aliena rerum notiones exprimunt;" and *allegoric,* "quæ alia, quam quæ proxime significentur, innuunt." And this is all the information which the learned professor has vouchsafed to afford us respecting the system which is said to have enabled Spohn to decipher entire demotic inscriptions, and to achieve other wonders in

---

necessary to give any demonstration to prove that the Egyptians received letters from the Phœnicians, but has contented himself with a reference to Zoega (*De Origine et Usu Obelisc.* p. 550), who, unfortunately for him, contends strenuously that the invention of letters is due, *not* to the Phœnicians, but to the Egyptians; an opinion which is supported by a great preponderating weight of ancient testimony, and by the concurrence of the most learned men of modern times. (See particularly, Plato *in Phileb.* p. 157, and *in Phædr.* p. 213; Cicero, *De Natur. Deor.* lib. iii. c. 22; Pliny, lib. vii. c. 56; Arnobius, lib. iv. p. 135: Diodorus Siculus, p. 14; Sanchoniathon apud Euseb. *Prepar. Evangel.* lib. i. c. 9, p. 31; Plutarch, *Sympos.* lib. ix. 9, 3, p. 738; Jablonski, *Pantheon Ægypt.* lib. v. c. 5, p. 161 *et seqq.;* Zoega, *De Orig. et Usu Obelisc.* p. 475.)

[1] In the appendix to M. Seyfarth's work, there is a very learned criticism, by Professor Weiske of Leipsic, on the celebrated passage of Clemens, in which, speaking of the perplexing πρωτα στοιχεια, he remarks, "At si noster (Clemens) τα πρωτα στοιχεια *initiales* voluisset esse verbi cujusque *litteras,* haud dubie του ὀνοματος ἑκαστου addidisset." Professor Weiske himself, resting on the authority of Aristotle's definition of the word στοιχειον (στοιχειον μεν ὀυν ἐστι φωνη ἀδιαιρετος . . . συνετη. *De Art. Poëtic.* c. 20), is inclined to render τα πρωτα στοιχεια "*simplicissimos sonos,* qui litteris exprimuntur;" a version which does not differ so widely from that of M. Letronne as he seems to imagine. For as the letters expressive of the *simplest* sounds were also the *most ancient,* it follows, even from M. Weiske's version, that τα πρωτα στοιχεια may equally mean τα παλαιοτατα—τα ἐξ ἀρχης γραμματα δια Καδμον ὀνομασθεντα.

Spohnian System.

this marvellous region. We are not told in what way, or by what process of investigation, the trim classification here proposed was discovered; no examples are produced in illustration of any of these classes, or to enable us to distinguish an emphonic from a symphonic, and both from an aphonic hieroglyphic. Every thing is left in the uncertainty and obscurity of vague generality; and after being informed that the hieroglyphical characters are the "symbols of letters," and nothing more, we learn, to our astonishment, that there is nevertheless a class of these characters (the *aphonic*) which consists, *not* of "symbols of *letters*," but of symbols of *ideas*. In short, there is neither sense nor coherence in the system itself, or in any explanation which can be given of it, even by so learned an expositor as Professor Seyfarth.

The plates, or rather hieroglyphical tables, which accompany Professor Seyfarth's work, though very beautiful specimens of lithography, are constructed on a principle which it is not easy to understand; unless, indeed, it was his object to involve the subject in impenetrable mystery. But upon this supposition they are undoubtedly masterpieces of skill and ingenuity. The order of the hieroglyphics on the monuments is totally disregarded; an arbitrary collocation is introduced; imaginary or fantastical values are assigned to detached characters; and no attempt whatever is made to bring this pretended system to the test of experiment, by applying it directly to the interpretation of Egyptian texts, whether enchorial, hieratic, or hieroglyphic. It is no doubt true that M. Seyfarth has ventured to give some scraps of translation, which are set forth with all the learned parade of the Chaldaic letters. But, in the first place, we are left completely in the dark as to the method of interpretation pursued by him; and, secondly, the versions actually given are either absolute nonsense, or, where they disclose a glimpse of meaning, are evidently mystifications of M. Champollion. A single example will be sufficient to establish the truth of what is here stated. M. Champollion renders a certain hieroglyphical legend thus: "Soutien de l'Egypte, dieu fils d'un dieu, soutien de l'Egypte, Horus, manifesté ou engendré par ou d'Osiris, engendré d'Isis déesse." But, according to Seyfarth, the meaning of the legend is, "Venias age, Isis, venias age, Ægyptiorum generator in Ægyptum *deus*;" or "Venias age, Isis venias age, Ægypti generator in Ægyptum generator;" which is merely a mystification of M. Champollion's version, with an absurdity peculiar to itself, in the first form, namely, that of calling Isis, the sister-spouse of Osiris, a *god*. It would be easy to multiply examples of the same description, and, moreover, to show that, where the learned professor has not the aid of a prior version to guide him, the obscurity thickens into impenetrable night, unilluminated even by a solitary flicker of sense or intelligence sufficient to make the darkness visible.

Professor Seyfarth, unmindful of his obligations to the system which it is his object to overthrow, contends that the interpretations of M. Champollion cannot be genuine, because, in the hieroglyphical spelling of proper names, sometimes one vowel is omitted, and sometimes another. But he forgets that such is the practice in almost all the oriental languages; that systematic accuracy was scarcely to be expected in writing foreign names and words; that it is often exceedingly difficult to transfuse the sounds of one language into another; that the workmen employed in sculpturing the hieroglyphics were most probably ignorant of the language to which the proper names in question belonged; and that their natural impulse must have been to shorten or abridge their labour as much as they possibly could. The learned professor also forgets that, according to his own system of arbitrary variations, no two persons would write the same word in the same way, or in precisely the same sort of characters; and that, whilst such differences or discrepancies as those he has referred to exist in all languages, without in the least degree affecting the certainty of the mode of writing, or materially obscuring the names thus variously spelled, the number must, on his system, have been almost infinite; and hence, if there be any force in the objection he has raised, it must bear principally against his own hypothesis. In every view, then, we consider the doctrine of Spohn and Seyfarth as wholly untenable. It rests on assumptions which are either false in principle or erroneous in fact; it requires, in its exposition, the admission of elements totally inconsistent with these assumptions; and it leads to results, or, at least, results are deduced from it, which have either no meaning at all, or one which is absurd and extravagant.

Acrological Hieroglyphics.

IX. ACROLOGICAL HIEROGLYPHICS.

The discovery of what M. Klaproth has termed *acrological hieroglyphics* belongs to the Chevalier Goulianoff. Having adopted the idea that τα πρωτα στοιχεια, in the passage of Clemens, so often referred to, means *the initial elements* of the names of objects, the chevalier imagined a system of writing according to which the same sign may equally well represent all objects the names of which commence with the same letter, as *cat*, *cabin*, *capstan*, *coast*, *caravel*, *castanet*; *duke*, *dunce*, *ditch*, *day*, *doom*, *devil*. The first intimation of this discovery given to the world was contained in a letter which M. Klaproth addressed to M. de Goulianoff; but the ironical tone which pervades this composition was calculated to excite a suspicion that the object of the learned author was rather to banter his correspondent, than to evince a frank and sincere adhesion to a burlesque system, based solely on the hieroglyphical explanations given by Horus Apollo, and without the slightest support from the monuments, on which nothing had as yet been discovered that bore the slightest resemblance to an *acrology*.[1] This letter, however, was not long afterwards followed by another addressed to a different person, in which M. Klaproth employed all the resources of his ingenuity and learning to give a colouring of plausibility to a system essentially ridiculous, and, at the same time, to expose the ignorance of Coptic displayed by M. Champollion, as well as the unwarrantable liberties which the latter had taken with that language, in coining words when he could not find any, and perverting known terms to answer his immediate purposes. Nor can it be denied that, if he signally failed in convicting the ancient Egyptians of having employed so absurd a system of writing as that imagined by M. de Goulianoff, he nevertheless succeeded in establishing, by irresistible proofs, the ignorance, and, what is much worse, the bad faith, of M. Champollion, in as far as regards the Coptic language. It would be a waste of time to attempt a grave refutation of the acrological hypothesis, the original conception of which appears to have been suggested by an ingenious mistranslation of the words of Clemens, whilst the development of the conceit thus imagined rendered it necessary to adopt, without challenge, all the puerilities of Horus Apollo. A system of writing according to which a *god* may be designated by a *gander*, a *hero* by a *horse*, or a *woman* by a *walnut*, is surely a fitter subject for ridicule than for reasoning.

---

[1] This name has been most infelicitously imagined. To render it susceptible of the sense which has been attached to it, from analogy with *acrostich*, it would have been necessary that λογος should signify a *word* or a *name*, as στιχος signifies a *verse*; but in Greek the grammatical sense of *word* or *name* is rendered by ὀνομα, λεξις, ῥῆμα, whilst λογος signifies *proposition*, *phrase*, *discourse*, and the like. It is no doubt true that we find the adjective ἀκρολογος applied as an epithet to the bee, and also the verb ακρολογεῖν; but these are simply used as poetic terms, composed of λογεω, and convey the idea of collecting honey from flowers, or cropping the summit of an object. If the words ἀκρολογος, ἀκρολογια, ἀκρολογικος, having as their root λογος or λεγω, had existed in Greek, they would have signified something analogous to the *point* or *summit* of *discourse*; *summary*, *superficial*, or *pointed discourse*; or perhaps a *discourse on points*; but they could never have conveyed any idea like that which has been attached to the words *acrological hieroglyphics*. (See Letronne, *Examen particulier des Expressions relatives aux Hiéroglyphes Phonétiques* in Champollion's *Précis*, p. 393. Paris, 1828.)

X. ELEMENTARY PRINCIPLES OF HIEROGLYPHICS.

The ancient Egyptians employed three distinct kinds of writing; I. the Hieroglyphic or sacred; II. the Hieratic or sacerdotal; and, III. the Demotic or popular, called also the Epistolographic, and Enchorial or common running hand of the country.

I. The Hieroglyphic or sacred writing is of three sorts; 1. Phonetic, in which the hieroglyphic stands for a letter, as the feather for A or E; 2. Emblematic or symbolic, when the object is represented by an emblem or symbol, as a hawk's head surmounted by a disc for the sun; 3. Figurative or pictural, when it is a representation of the object itself, as the image of a man or a horse to indicate *man* or *horse*.

In the first of these modes, words are formed of a number of phonetic hieroglyphics, in the same manner as in any other alphabetical mode of writing: thus MAI, *beloved*, is expressed by three characters respectively representing M, A, I; and IOH, *the moon*, by an equal number representing I, O, H. In words which are written phonetically, the medial vowels are very often suppressed, as in the Hebrew, Phœnician, Arabic, and other oriental languages; sometimes, indeed, the vowels are altogether omitted. Each sound or articulation may be represented by several homophonous signs; but the employment of one in preference to another seems to have been regulated by considerations derived from the material form of the sign, and the nature of the idea to be expressed by the phonetic characters.

The emblematic and figurative kinds are too simple to require any remarks. In the former, ideas are expressed by symbols, as when a part is put for the whole, or one thing is metaphorically employed to represent another. The latter is merely picture-writing. In the Egyptian sentence, "We give you the assemblies of Ra, the God," all the three kinds of hieroglyphic writing are simultaneously employed; "We give you" being expressed phonetically, "the assemblies" figuratively, "of" phonetically, "Ra" emblematically, and "the God" figuratively.

When two words resembled each other, the same character often stood for either of them; as NEB, *lord*, and NIBEN, *all*, each of which is represented by a segment of a sphere, or, as some think, a species of hatchet. The force or value of a phonetic sign is, according to Champollion, derived from the initial sound of the Egyptian name of the object which it represents. Thus the figure of an owl, MOULADJ, represents M, that of a goat or ram, BAAMPE, B, and that of a star, STOU, S. This might seem calculated to occasion great confusion, from the miscellaneous use of different signs; but, practically, the Egyptians confined themselves to particular characters in writing particular words; for example, *Amun*, which is invariably expressed by the same phonetic signs. Some few variations are, however, to be met with in writing the same word, as in MAI, *beloved*, and N, *of*, in which the characters are occasionally changed; but these variations are limited in number, and used with great discretion. Besides, many signs, as, for instance, a camel, are always excluded from the phonetic alphabet.

The next material point is the expletive sign. This is put after words to denote their grammatical force or effect. Thus an arm, with the forefinger of the hand pointing upwards, denotes an active sense, as "cuts," and a straight line, with a small leaf or flourish on one side, shows that the word preceding it is a noun, as in the expression "great honour," where the expletive is inserted after the adjective as well as after the substantive. But in those groups which are of most frequent occurrence, or the sense of which is unequivocal, these signs are often omitted.

The plural number is indicated by three lines, III, following the object, or by that object being thrice repeated; the dual number, when employed, is represented by two lines, but this is of rare occurrence.

The names of kings are contained in two scrolls or elliptical rings, the first of which includes the prænomen, composed of titles derived chiefly from the names of the gods, and the second the nomen or phonetic name of the king; as *Amasis*, *Ptolemy*. The former is generally preceded by the title "king of men, lord of the worlds, good god" (*divus bonus*); the latter by "son of Ra, lord of the strong." The queens have only a phonetic scroll or ring, preceded by the title "royal wife, the potent queen of the world."

The names of individuals are followed by the figure of a man, and are not enclosed in an oval or scroll; as "Germanicus, man."

The hieroglyphics are always to be read *towards* the faces of the figures. Thus, if the front be to the left, they must be read from left to right; if to the right, from right to left; and if arranged in perpendicular lines, from the top downwards. Historical tablets commence with the year of a king's reign, and the month of that year; but no trace of any era, such as the Christian or Mohammedan, has been discovered in these sculptures.[1] Sentences placed over the figures of the gods, and beginning, "This is (the figure) of," are arranged perpendicularly; as in the expression, "This is (the figure) of Isis, goddess."

A memorial, μνημα, or commemorative inscription, always commences with the same group of characters; offerings are in like manner represented by invariable signs; and the same thing may also be predicated of adoration or prayer.

In historical subjects the names of kings are preceded and followed by a profusion of titles relating to "power," "victory," and other attributes or distinctions, or by such expressions as "like the sun, like Atmoo, lord of the assemblies, like his father Phtha, like Horus," and so forth.

Pronouns combine with the groups which they qualify; as SONPH, Coptic PEPHSON, *his brother*, SONK, Coptic PEKSON, *your brother*.

In the names of districts and towns, the sign of "land" is placed after them: thus, "Philae or Ailak, land of;" "Ap or Tape (Thebes), land of." The sign which signifies "foreign land," may also apply to "country" in general, in opposition to the particular sign indicating "land." Town or abode is indicated by the hieroglyphic equivalents of EI, *house*, as EI-*Amun*, the "abode of Amun," or *Diospolis*.

II. The Hieratic or sacerdotal writing is immediately derived from the hieroglyphic, of which it is merely a tachygraphy or abbreviated form. The signs are accordingly considerably abridged; but they nevertheless comprehend figurative, emblematic, and phonetic characters, though instead of the two former are often substituted groups of characters, which are either phonetic or altoge-

[1] See Young, *Rudiments of an Egyptian Dictionary in the ancient Enchorial Character*; Wilkinson, *Materia Hieroglyphica.*

Elementary Principles.

ther arbitrary, "qui ne conservent plus la forme de leur signe correspondant dans le système hiéroglyphique."

All the hieratic manuscripts extant, whether they are of the Pharaonic, the Macedonian, or the Roman epochs, belong to one system, that is, exhibit merely an abbreviated form of the hieroglyphic writing, however widely some of the characters may at first view appear to differ from it. This method seems to have been confined to the transcription of texts connected with matters of religion or science, or to inscriptions of a character purely religious.

III. The Demotic, Epistolographic, or Enchorial, is a method of writing distinct from the hieroglyphic, and also from the hieratic, of which it is an immediate derivative. The signs employed in the demotic or enchorial texts are, in fact, only simple characters, borrowed from the hieratic. The demotic nearly excludes all figurative characters, picture-writing being incompatible with the object aimed at in a current hand; but it admits emblematic or symbolical signs, though, according to Champollion, "seulement pour exprimer des idées essentiellement liées au système religieux."

The characters employed in the demotic or enchorial are much less numerous than those of the other methods; and Champollion affirms that a large proportion of them are phonetic. But this is evidently a mistake; for Mr Akerblad, who proceeded upon the assumption that the greater part of the enchorial characters were letters, or signs of sounds, failed to interpret a single word of the demotic text of the Rosetta inscription; whilst Dr Young, who conceived that proper names alone were written alphabetically, succeeded in interpreting the words or groups, and eventually deciphered all that remains of this branch of the triple inscription. During a long series of ages, the demotic, the hieratic, and the hieroglyphic methods of writing were simultaneously in use throughout the whole extent of Egypt.

In stating the elementary principles of the demotic writing, we shall begin with the verb. It appears to possess only a single form. When the root is prefixed to a noun or to a personal pronoun, without any qualification preceding, it may be translated by an indefinite past tense; and sometimes, when the sense requires it, even by the present, as happens in several of the Semitic languages. When the conjunction signifying *that* is prefixed to the radical form, the latter is thereby converted into a kind of optative or subjunctive, as "he took care *that they should do it*;" and the particle appears to convert the same primary form into a preterperfect. Of the pronouns annexed to the root, only four, *I*, *he*, *we*, and *they*, have as yet been met with; but there are probably three others, which still remain to be discovered, *thou*, *she*, and *ye*. The auxiliary verb denoting *ought* is used to express the imperative and future. It precedes the nominative, whether it be noun or pronoun, and then follows the root, as in the example (*Rosetta Inscript.*) signifying *debent sacerdotes colere*, the priests ought to attend to. The passive voice is commonly expressed periphrastically by means of the plural pronoun of the third person. Thus, for "the priests ought to be called," we have, "they ought to call the priests;" and for "that the customary things should be done," we find, "that they should do the customary things."

The only exception to the general rule, that the verb precedes its nominative, occurs when the nominative is a relative pronoun. The pronoun whence comes the Coptic ETE, prefixed to the verbal root, forms a kind of past participle, as in the example "who established," in Greek καταστησαμενον; but the particle used pronominally seems always to express the present participle, as in the example "who enter," in Greek εἰσπορευομενοι. If no verb follow this particle, it signifies "who is" or "who are." The initial vowel of this word is seldom expressed; indeed the omission of vowels may be regarded as a general practice in the enchorial writing.

Elementary Principles.

A masculine noun is made feminine by the addition of the termination T; and this termination, or an equivalent one, added to adjectives, converts them into abstract nouns. The plural of nouns is usually formed by adding an upright stroke A or E, as may be seen in the plural of "*priests*;" but, in the enchorial, as in the hieroglyphical writing, plurality is more commonly indicated by subjoining to the noun three upright strokes. Masculine nouns singular take one article; feminine nouns, singular and plural, take another, which is also used generally before the possessive pronoun when it precedes the noun. The possessive pronouns experience no change on account of gender or number, and are sometimes represented by affixes, as in the hieroglyphical method of writing.

All or *every* is expressed after the noun, as "the temples of Egypt, *all* of them." *Each* is expressed by the adjective following the noun written twice, as in the example, "the priests who are of the temple, temple each," that is, "the priests who are of each temple." Cardinal numbers follow the noun in the singular, with the singular article prefixed, if there be occasion to use one. This is contrary to the usage of almost every other language; but it is well established that such is the enchorial practice. Ordinal numbers are the same as the cardinal; but, for distinction, a T is sometimes placed after such numbers.

In the enchorial method of expressing the common fractions after figures, and in sentences, we discover a striking resemblance to that which we now employ, the fraction being represented by an oblique line, with the denominator placed underneath. The word denoting "one half," is easily read PHAKAT, a word which, with a slight modification, is used at this day in both parts of Nubia to signify the same thing.[1] The words denoting one third, one fourth, and so on, are used with or without the accompanying word signifying *part*, just as in English we say indifferently *a fourth* or *a fourth part*.

For the numerals, hieroglyphic, hieratic, and enchorial, the reader is particularly referred to Professor Kosegarten's first Commentation *De Prisca Ægyptiorum Litteratura*, also to Young's *Rudiments of an Egyptian Dictionary*, and to Wilkinson's *Materia Hieroglyphica*. That the forms of the Arabic numerals have been borrowed from the Egyptian, the slightest inspection will show; but the latter have no value in position, a circumstance which forms the distinguishing characteristic, as well as the great superiority, of the Arabic method of notation.

Plate CCLXXXV. contains the hieroglyphico-phonetic alphabet, according to Wilkinson's arrangement, which we consider as decidedly the best. The characters are divided into *certain*, *probable*, and *doubtful*. The *certain* are those for which there is sufficient authority or evidence, deduced chiefly from the names of the Ptolemies and the Cæsars. The *probable* are those which, on good grounds, are supposed to correspond to the respective letters under which they have been arranged, but for which no direct or positive authority can be produced. The *doubtful* are not only without positive authority, but in a great measure conjectural; though, as far as conjecture goes, they are supposed to correspond to the letters under which they are respectively placed. (A.)

---

[1] We learn from Burckhardt that the Kensy word for "one half" is *bagatto*, and that the Nouba word is *Fagat-wera*, literally, "half one," *Fagat* meaning half, and *wera* one.

HIEROMANCY, in *Antiquity*, that part of divination which predicted future events from observing the various things offered in sacrifice.

HIEROMNEMON, amongst the ancient Greeks, signified a delegate chosen by lot, and sent to the great council of the Amphictyons, where it was his business to take care of all that concerned religion. The hieromnemonies were reckoned more honourable than the other members of that assembly, the general meetings of which were always summoned by them, whilst their names were prefixed to the decrees enacted by the council.

Hieromnemon (composed of ἱερος, *sacred*, and μνημων, *one who reminds of*), an officer in the ancient Greek church, whose principal function was to stand behind the patriarch at the sacraments and ceremonies, and show him the prayers and psalms, which he was to rehearse. He also clothed the patriarch in his pontifical robes, and assigned the places of all those who had a right to be around him when seated on his throne, just as the master of the ceremonies now does to the pope.

HIEROPHANTES, or Hierophanta (from ἱερος, *holy*, and φαινομαι, *I appear*), a priest amongst the Athenians. The hierophantes was properly the chief person who officiated in the Eleusinian mysteries. This office was first executed by Eumolpus, and continued in his family for about twelve hundred years, though when any person was appointed to this dignity he was required always to live in celibacy.

HIEROPHYLAX, an officer in the Greek church who officiated as guardian or keeper of the holy utensils, vestments, &c. and who answered to our sacrista or vestry keeper.

HIERES, four small islands in the Mediterranean Sea, a part of the department of the Var in France. They are near Toulon, and form shelter for a roadstead of the same name, where ships are protected by the town of Hiérès on the mainland. That town is small, but is remarkable for the mildness of the climate, and for the quantity of pomegranates, figs, and other fruits, which the vicinity yields.

HIGH, a term or relation, importing that one thing is superior to or above another. Thus we say a *high* mountain, the *high* court of parliament, *high* relief, and the like.

High, in *Music*, is sometimes used in the same sense with *loud*, and sometimes in the same sense with *acute*.

High Places were eminences upon which the heathens used to worship their gods, and which were chosen for that purpose as being supposed to be nearer heaven, their constant residence. The Jews are frequently blamed for their attachment to high places, after the manner of the Gentiles; and their *proseuchæ* were frequently upon mountains, with groves planted round them. Where high places are reprobated in Scripture, therefore, we should understand them as places abused and prostituted to idolatrous purposes.

High Way, a free passage for the king's subjects; on which account it is called *the king's high way*.

High-Way-Men are robbers on the high way, for the apprehending and taking of whom a reward of L.40 is promised by the statute 4 and 5 W. and M. to be paid within a month after conviction by the sheriff of the county; to which the statute 8 Geo. II. cap 6 superadds L.10 to be paid by the hundred indemnified by such capture.

HIGHAM-FERRERS, a town of the county of Northampton, which gives name to the hundred in which it stands, and is sixty-four miles from London. It is an ancient borough, formerly returning one member to parliament, but disfranchised by the law of 1832. There is a small market on Saturday. The inhabitants amounted in 1801 to 726, in 1811 to 823, in 1821 to 877, and in 1831 to 965.

HIGHGATE, a populous village, four miles from London, on the great north road. It is situated on a hill overlooking the metropolis, and commanding extensive views to the south beyond it. It is the residence of several of the opulent merchants and traders of the city, some of whose houses are of great elegance. It is partly in the parish of Hornsey and partly in that of Pancras, but has a church or chapel of ease. It was designed a few years ago to form a tunnel and a roadway through the hill; but that plan has yielded to an archway, which has lightened the labour of horses.

HIGHLANDERS, a general appellation for the inhabitants of the mountainous parts of any country. In Britain, the name is appropriated to the people who inhabit the mountainous parts of Scotland, to the north and north-west, including those of the Hebrides or Western Isles. See Scotland.

HIGHMORE, Joseph, a painter and writer of some eminence in his day, was born in the parish of St James's, Garlickhithe, London, on the 13th of June 1692, being the third son of Mr Edward Highmore, a coal-merchant in Thames Street. Having such an early and strong inclination to painting that he could think with pleasure of nothing else, his father endeavoured to gratify him by making a proposal to his uncle, who was serjeant-painter to King William, and with whom Mr, afterwards Sir James Thornhill, had served his apprenticeship. This however was subsequently for good reasons declined, and he was articled as clerk to an attorney in 1707, but so much against his own declared inclination, that in about three years he began to form resolutions of indulging his natural disposition for his favourite art, having continually employed his leisure hours in designing, and in the study of geometry, perspective, architecture, and anatomy, but without any instructors in these branches except books. He had afterwards an opportunity of improving himself in anatomy, by attending the lectures of Mr Cheselden; besides entering himself at the painters' academy in Great Queen Street, where he remained ten years, and had the honour to be particularly noticed by Sir Godfrey Kneller, who distinguished him by the name of the Young Lawyer. In 1714 his clerkship expired; and in 1715 he began painting as a profession, and settled in the city. In the same year Dr Brook Taylor published his Linear Perspective. On this complete and universal theory our artist grounded his subsequent practice; and it has been generally allowed, that few if any of the profession at that time were so thorough masters of Taylor's excellent but intricate system. In 1716 he married Susanna, daughter and heiress of Mr Anthony Hiller of Effingham, in Surrey; a young lady in every respect worthy of his choice. As his reputation and business increased, he took a more conspicuous station, by removing to a house in Lincoln's-Inn-Fields; and an opportunity soon offered of introducing him advantageously to the nobility, by his being desired, by Mr Pine the engraver, to make drawings for his prints of the knights of the bath, upon the revival of that order in 1725. The publication of Pamela in 1744 gave rise to a set of paintings by Highmore, which were engraved by two French engravers, and published by subscription in 1745. In the same year he painted the only original of General Wolfe, who was then about eighteen years of age. His Pamela introduced him to the acquaintance and friendship of the excellent author of that work, whose picture he drew, and for whom he painted the only original of Dr Young. In 1750 he had the misfortune to lose his wife. On the first institution of the Academy of Painting and Sculpture, in 1753, he was elected one of the professors; an honour which, on account of many avocations, he was induced to decline. In 1754 he published a critical examination of two paintings by Rubens on the ceiling of the banqueting-house at Whitehall, in which architecture is introduced, as far as relates to perspective; together with the discussion of a question which has been the subject of debate amongst painters; printed in 4to. Of the numerous portraits which Mr Highmore painted, in an extensive practice of forty-six years, it is impossible and useless to discuss the merits. Some of the best in the historical branch may, however, be mentioned, viz. Hagar and Ishmael; the Good Samaritan; the Finding of Moses; the Harlowe Family, as described in Clarissa; Clarissa, the portrait mentioned in that work; the Graces Unveiling Nature; the Clementina of Grandison; and the Queen Mother of Edward IV. with her younger son, in Westminster Abbey.

His principal literary work was his Practice of Perspective, on the principles of Dr Brook Taylor, written many years before, but not published till 1763. In 1765 he published Observations on a Pamphlet entitled Christianity not founded on Argument; and in the same year two small volumes of Essays, moral, religious, and miscellaneous, with a translation in prose of Mr Brown's Latin poem on the immortality of the soul. A strong constitution, and constant attention to his health, prolonged his life and preserved his faculties until his eighty-eighth year, when he gradually ceased to breathe, and, as it were, fell asleep, on the 3d of March 1780.

HIGHNESS, a quality or title of honour given to princes. The kings of England and Spain had formerly no other title but that of Highness; the former till the time of James I. and the latter till that of Charles V. The petty princes of Italy first began to be complimented with the title of Highness in the year 1630; and the Duke of Orleans assumed the title of Royal Highness in the year 1631, to distinguish himself from the other princes of France.

HIGHWORTH, a market-town of Wiltshire, which gives its name to the hundred. It is situated on a pleasant hill near the Valley of the White Horse, seventy-seven miles from London, has a market, which is held on Wednesday, and was formerly a corporate place. The inhabitants amounted in 1801 to 1493, in 1811 to 1580, in 1821 to 1388, and in 1831 to 3127.

HIJA, or HIXAR, a city of Spain, in the kingdom of Aragon, about thirty miles from Saragossa. It contains a church, a monastery, and two hospitals or poor-houses, with 2800 inhabitants, and confers the dignity of a duke on one of the oldest families of Spain.

HILARIA, in *Antiquity*, feasts celebrated every year by the Romans, on the 8th of the kalends of April, or the 25th of March, in honour of Cybele, the mother of the gods. The *hilaria* were celebrated with great pomp and rejoicing. Every person dressed himself as he pleased, and assumed the marks or badges of whatever dignity or quality he had a fancy for. The statue of the goddess was carried in procession through the streets of the city, accompanied by multitudes in the most splendid attire. The day before the festival was spent in tears and mourning. Cybele represented the earth, which at this time of the year begins to feel the kindly warmth of the spring; so that this sudden transition from sorrow to joy was an emblem of the vicissitude of the seasons, which succeed one another. The Romans originally derived this feast from the Greeks, who called it αναϐασις, *ascensus*; and the eve of the day they spent in tears and lamentations, whence they denominated it καταϐασις, *descensus*. But afterwards, the Greeks took the name ἱλαρια from the Romans; as appears from Photius, in his extract of the life of the philosopher Isidore.

HILARIUS, an ancient father of the Christian church, who flourished in the fourth century. He was born, as St Jerome informs us, at Poictiers, being descended of a good family, and he received a liberal education in the Pagan religion, which he did not forsake till he had arrived at maturity. He was advanced to the bishopric of Poictiers in the year 355, according to Baronius, and became a most zealous champion of the orthodox faith, particularly against the Arians, who were at that time gaining ground in France. He assembled there several councils, in which the determinations of the synods of Rimini and Seleucia were condemned. He wrote a treatise concerning Synods, and a work in twelve books on the Trinity, which is much admired by orthodox believers. He died about the end of the year 367. His works have been many times published; but the best edition of them is that by the Benedictines at Paris in 1693.

HILARODI, in the ancient music and poetry, a sort of poets amongst the Greeks, who went about singing little gay poems or songs, somewhat graver than the Ionic pieces, accompanied with some instrument. From the streets they were at last introduced into tragedy, as the magodi were into comedy. They appeared dressed in white, and were crowned with gold. At first they wore shoes; but afterwards they assumed the *crepida*, being only a sole tied over the foot with a strap.

HILARY, ST, a town, the capital of the island of Jersey. It has a very convenient and secure harbour, defended by a strong castle; and the town is powerfully fortified both on the land and the sea sides, and the entrance from the country is protected by a drawbridge and an iron gate. The town is well built, with broad streets, and there is an elegant building for the courts of justice of the island. In the church the public worship is performed in both the English and French languages. It has an excellent market on Saturday. The corn market is held in a handsome building, supported by piazzas of the Tuscan order. At the census of 1831, the inhabitants consisted of 16,027 persons, viz. 7298 males, and 8729 females. Long. 5. 24. 25. W. Lat. 50. 7. 38. N.

HILBURGHAUSEN, a city, the capital of the duchy of Saxe-Hilburghausen, in Germany. It stands on the right bank of the river Werra, is surrounded with walls, and contains the magnificent palace of the sovereign, two Lutheran churches and one Reformed, and several other public buildings. It is divided into three parts, the old town, the new, and the suburbs, which together have a population of 3820 persons, in 362 houses. It is a place of little commerce, and depends chiefly on the trade arising from the court, and from being the residence of the officers of the several boards of law and revenue.

HILDESHEIM, a province of the kingdom of Hanover, formerly an ecclesiastical state, but secularized and transferred to Prussia in 1803, and in 1805 delivered over, with Goslar, to the Hanoverian government. It is bounded on the north by Luneburg, on the east by Brunswick, on the south-east by Saxon Prussia, on the south by the Hartz and Brunswick, and on the west by Calenburg. It extends over 683 square miles, and comprehends nine cities, four market-towns, 240 villages and hamlets, formed into 135 parishes, with 18,803 houses, and a population in 1812 amounting to 121,816, now estimated to have since increased one fifth. The greater part of the inhabitants are Lutherans, but one sixth are Catholics, with a few Jews, and some Protestant sects. It is for the most part a level district, but towards the south there are some lofty mountains. A considerable portion of the land is covered with wood, and the rest yields moderate crops of rye, barley, flax, and potatoes, with some little wheat. It produces feathers, honey, and wax. The females spin much flax, and the yarn is an article of export; as are also wool, hops, rape-oil, and timber. The province is well watered by the rivers Innerste, which rises in the Hartz, by the Ecker, the Radau, and several small streams, which all finally terminate by the Leine, in the Weser. The province is governed by its own assembly of states, and has still its bishop, who has only ecclesiastical authority over the Catholics.

HILDESHEIM, a city of Hanover, the capital of the province of that name. It is situated on the river Innerste, and surrounded with walls and ditches, which have been converted into promenades. It contains an ancient cathedral, containing, amongst other antiquities, a pillar called the Irmin-Saule, said to have been constructed by the Saxons in honour of Arminius, who defeated the Roman army under Quintilius Varus. There are three other Catholic and four Lutheran churches, with 1874 dwelling houses, and 13,820 inhabitants. It contains a Catholic seminary called Joseph's Gymnasium, with eleven professors, and several schools for elementary instruction. It has some manufactures of ironmongery, linens, leather, soap, starch, snuff, and yarn. Near to it is the Zwergshohle, a saline spring, from which some Glauber salts are prepared. Long. 9. 48. 28. E. Lat. 52. 9. 32. N.

HILL, AARON, a poet of considerable eminence, the son of a gentleman of Malmesbury Abbey, in Wiltshire, was born in 1685. His father's imprudence having ruined his paternal inheritance, he left Westminster School at fourteen years of age, and embarked for Constantinople to visit Lord Paget, the English ambassador there, who was his distant relation. Lord Paget received him with surprise and pleasure, provided him a tutor, and sent him to travel, thus affording him an opportunity of visiting Egypt, Palestine, and a great part of the East. About the year 1709 he published his first poem, entitled *Camillus*, in honour of the Earl of Peterborough, who had commanded in Spain; and being the same year made master of Drury-lane Theatre, he wrote his first tragedy, called *Elfred*, or the Fair Inconstant. In 1710, he became master of the opera-house in the Haymarket, and wrote an opera called Rinaldo, which met with great success, being the first that Handel set to music after he came to England. Unfortunately for Mr Hill, he was a projector as well as poet, and in 1715 obtained a patent for extracting oil from beech-nuts; an undertaking which miscarried after engaging his attention for three years. He was also concerned in the first attempt to settle the colony of Georgia, from which he never reaped any advantage; and in 1728 he made a journey into the Highlands of Scotland, in prosecution of a scheme of applying the woods there to ship-building; but in this he also lost his labour. Mr Hill seems to have lived in perfect harmony with all the writers of his time, except Mr Pope, with whom he had a short paper war, occasioned by that gentleman's introducing him in the Dunciad as one of the competitors for the prize offered by the goddess of Dulness. Mr Hill, amongst many other pieces, also wrote one called *The Northern Star*, upon the actions of Peter the Great; and for this he was several years afterwards complimented with a gold medal from the Empress Catharine, agreeably to the czar's desire before his death. His last production was *Merope*, which was brought upon the stage in Drury Lane by Mr Garrick. He died on the 8th of February 1749, and after his decease four volumes of his works in prose and verse were published in octavo, and his dramatic works in two volumes.

HILL, *Sir John*, a voluminous writer, and singular character, was born about the year 1716. He was originally bred an apothecary; but his having married early, and without a fortune, made him very soon look around for other resources than his profession supplied. In the year 1746, he translated from the Greek a small tract by Theophrastus, on Gems, which he published by subscription; and which, being well executed, procured him friends, reputation, and money. Encouraged by this, he engaged in works of greater extent and importance. The first he undertook was a General Natural History, in three vols. folio. He next engaged, in conjunction with George Lewis Scott, in furnishing a Supplement to Chambers's Dictionary. He at the same time started the British Magazine; and whilst he was engaged in a great number of works, some of which would seem to have claimed the continued attention of a whole life, he carried on a daily essay, under the title of Inspector. Amidst this hurry of business, Mr Hill was so laborious and ready in all his undertakings, and was withal so exact an economist of his time, that for many years he scarcely ever missed a public amusement, where, whilst he relaxed from the severer pursuits of study, he gleaned up articles of information for his periodical works. It would not be easy to trace Mr Hill through all his various pursuits in life. He obtained his doctor's degree from the university of St Andrews. A quarrel he had with the Royal Society, for being refused admission as a member, provoked him to ridicule that learned body, in a review of the works of the Royal Society, 4to, 1751. This, together with his writing upon all subjects without reserve, made him sink in the estimation of the public nearly at the same rate at which he had ascended. He found, as usual, however, resources in his own invention. He applied himself to the preparation of certain simple medicines, as the essence of water-dock, tincture of valerian, balsam of honey, and the like. The well-known simplicity of these medicines made the public judge favourably of their effects, insomuch that they had a rapid sale, and once more enabled the doctor to figure in that style of life which was so congenial to his inclination. He obtained the patronage of the Earl of Bute, through whose interest he acquired the management of the royal gardens at Kew; and, to wind up the whole of an extraordinary life, having a little before his death seized an opportunity to introduce himself to the knowledge of the king of Sweden, that monarch invested him with the order of knighthood, which he had not the happiness of enjoying above two years. He died near the close of the year 1775.

HILVERSUM, a town of the Netherlands, in the province of North Holland, between Amsterdam and Norden. It contains 3520 inhabitants, who carry on extensive manufactories of carpets, floor-cloths, woollen baize, and kerseys, and make some cotton goods.

HILLAH. This town stands on a portion of the site of the ancient Babylon. It is situated about sixty miles to the south of Bagdad, on the western bank of the Euphrates. It is inclosed with a mud wall, and is said to have been built in the twelfth century, partly out of the ruins of the ancient city of Babylon. The land in the immediate neighbourhood is cultivated and fertile, and produces great quantities of rice, dates, and grain. This fertility is caused by the irrigation of the Euphrates, which here flows from two to two and a half miles an hour, and varies in breadth from 450 to 500 feet; and in spring, when it is in flood, is forty feet in depth. During six months of the year, the Euphrates is navigable as far as Hillah for flat-bottomed vessels not exceeding fifty tons burden. During the other six months the marshes of Lemloon entirely obstruct the commerce with Bassora; and but for this circumstance it would become the seat of a flourishing commerce. Hillah contains 12,000 inhabitants. A part of the town is situated on the eastern bank of the river, and is connected with the other by a bridge of boats, but is not nearly so extensive as that on the western bank. The town is well built, has an extensive and well-regulated bazar, several stately caravanserais built of the old Babylonian bricks, and numerous coffee-houses, along the bank of the river. It is governed by a magistrate deputed by the pasha. It is 48 miles to the south of Bagdad; 35 south-east of the Nahr-Malcha, at its junction with the Tigris, which is the site of Seleucia; and 130 miles west from Hit, a town on the Euphrates. Long. 44. 13. 15. E. Lat. 33. 34. N. See BABYLON.

Himalaya Mountains.

Himalaya Mountain

HIMALEH, or HIMALAYA (literally the *Seat of Snow*), sometimes HIMACHAL (*Snowy Mountains*), are the names given to a vast range of lofty mountains which separates India from the two Thibets, and forms the highest part of that extended chain which was known to the ancient writers of Europe by the names of *Imaus* or *Emodus*, which is, in all probability, a corruption of the Sanscrit name; as "*Imaus*," says Pliny, "in the language of the natives, signifies *snowy*."

If we consider the Himalaya as extending from the defile near Cashmere through which the Setlij or Sutledge flows, to that through which the Brahmapootra passes, the length will be, from north-west to south-east, nearly 1000 British miles; the western extremity being about the latitude 32°, and longitude 77°; the eastern about the latitude 24°, and longitude 95°. Throughout the whole of this extent their snow-capt summits present a succession of peaks of great but unequal elevation, some of which, in the fine pure atmosphere of Hindustan, are visible at an almost incredible distance. "The southernmost ridge of the Bootan Mountains," says Major Rennell, "rises near a mile and a half perpendicular above the plains of Bengal, in a horizontal distance of only fifteen miles; and, from the summit, the astonished traveller looks back on the plains, as on an extensive ocean beneath him." Beyond is a chain of peaks still higher, which, he adds, "are visible from the plains of Bengal, at the distance of 150 miles, and are commonly covered with snow." From these expressions, and from his conclusion of their being "in point of elevation equal to any of the mountains of the old hemisphere," it is quite clear that this celebrated geographer had no adequate idea of their real height.

On the northern termination of the plains of Hindustan is a narrow belt of a thickly wooded, swampy country, called Terreeana, between which and the base of the great Himalaya chain lies a broad tract of a rugged, mountainous region, from sixty to a hundred miles in width, full of fertile and well-peopled valleys, and once divided into a number of petty states, which are now mostly absorbed by the British or the Chinese empires; the latter at least laying claim to some of the hilly countries to the south of the Himalaya, as tributary states, to which our recent conquests have brought us into immediate contact. Beginning at the westward, the principal of these states were Serinagur, Almora, Kemaoon, Gorkah, Nepaul, and Bootan: all of these are parts of the mountainous belt, and their towns and fortresses occupy the summits of hills rising to the height of from 4000 to 6000 feet; and many of the shoulders or abutments which connect these hills with the lofty range of Himalaya are from 8000 to 14,000 feet high. The great extent of these mountain masses produces a greater degree of cold in winter than would probably be found in the same degree of latitude in Europe at an equal elevation; and, as will presently appear, a greater degree of heat also. In the middle of winter the snow covers the summits of those inferior hills, and falls sometimes even in the interjacent valleys; but the climate, in every part of this mountainous region, is delightfully fine, and almost all the species of European vegetables are found in a native state, and growing in the greatest luxuriance. In fact, since we have had free access to the base of the Himalaya range, it has been discovered that the general character of the vegetation corresponds very nearly with that of the middle and southern parts of Europe, and that a very large portion of the trees and shrubs of the latter are indigenous in the former; such as pines of various species, oaks, chestnuts, horse-chestnuts, walnuts, birch, the hazel, the raspberry, gooseberry, bilberry, barberry, and strawberries. Many of the flowering shrubs, and the humbler plants, as the polyanthus, anemone, and ranunculus, the common and lemon thyme, mint, sweet basil, and a great variety of other aromatic plants, clothe the sides of the hills, and shed their fragrant odours around. Moorcroft mentions the furze (*Ulex Europea*), which was supposed not to be met with out of Europe. These hills may be considered as the roots and branches of the great stem, all of them connected more or less remotely with it, and appearing at a distance, when seen from the plains of Hindustan, as a succession of inferior ranges; but, on entering the country, "the whole," says Mr Fraser, "becomes a confused and chaotic assemblage of most rugged mountains, huddled into masses and peaks, and running into ridges which defy arrangement."[1]

The highest peaks of the Himalaya Mountains had long been noticed before it was known or even conjectured what their absolute height might be above the level of the sea. All the information respecting them that could be obtained was derived from Hindu pilgrims, who annually flocked to pay their devotions at the shrine of some deity presiding over the various wild and awful features of these elevated regions. To a people gifted, like the Hindus, with strong imaginative faculties, the snow-capt summits of the Himalaya Mountains, and the numerous torrents issuing from their bosom, which, when united into one grand stream, carried fertility over their extensive plains, could not fail to become so many varied objects of their veneration. From the accounts of these people, the main branch of the Ganges was represented to issue from a chasm or cavern in the side of the mountains, to which, from its supposed resemblance to the mouth of an animal sacred in the ritual of their faith, was given the name of the *Cow's Mouth.* This cavern was supposed to perforate the great chain of mountains, and the source of the Ganges to be in a lake on the other side, considerably to the eastward of the Cow's Mouth. This lake was named Manasarovara, and was held sacred; and, under the impression of the relation of pilgrims being correct, the source and passage of the Ganges were laid down in the most improved maps of Hindustan.

The authority, however, on which this hypothesis rested not being deemed satisfactory, it was determined by the Bengal government that an expedition should be undertaken to ascertain how the fact stood; and Captains Raper and Hearsay, accompanied by Captain Webb, assistant-surveyor, set out in the spring of the year 1808, in order to clear up this point; and from their observations, and those of more recent travellers, it has now been ascertained, that the main sources of the Ganges are all on the southern side of the great Himalaya chain; and that, reckoning from the westward, they consist of, 1. the Jumna (whose two great branches are the Girree and the Touse); 2. the Bhagiruttee, whose source is near the celebrated spot called Gangoutri, where the Cow's Mouth is supposed to be situated; and, 3. the Alkananda, with its numerous tributary streams, the last of which rivers is now acknowledged as the main branch of the Ganges.

The object of Captains Raper and Hearsay was to penetrate as far as possible to the sources of the two great branches, the Bhagiruttee and the Alkananda. With great difficulty and fatigue they approached near enough to Gangoutri to enable them to conclude, from the contraction of the stream, and the stupendous height and unbroken sides of the Himalaya Mountains, that "there can be no doubt but the source of that branch is situated *in* the snowy range;" and that "any other hypothesis can scarcely be reconciled to hydrostatical principles." Not quite satisfied, however, with this conclusion, they dispatched one of those fanatics of India, known by the name of Fakirs, who deem a pilgrimage to Gangoutri to have the effect of redeeming the person performing it from all the troubles of this life, and of ensuring him a happy passage through all the stages of transmigration which he is destined to undergo in another, to push his inquiries farther into the mountains. This man reported, on his return, that, a few miles beyond Gangoutri, the river was lost under vast beds of snow, and that a rock in the midst of the rushing stream resembled the body and head of a cow; and here the valley was terminated by the steep and wall-sided mountain.

---

[1] *Journal of a Tour through part of the Snowy Range of the Himalaya Mountains*, 4to, Lond. 1820.

The party next set out in order to trace the other great stream of the Ganges, the Alkananda, and succeeded in reaching a spot four or five miles beyond the temple of Bhadrinath, where the stream was narrowed to eighteen or twenty feet, and where "the north faces of the mountains were completely covered with snow from the summit to the base." A little way beyond this place was a cascade named Barsiê d'Hara, where the Alkananda (or, as sometimes called, the Vishnuganga) was entirely concealed under immense heaps of snow, beyond which no traveller has been known to pass. Yet this place was estimated to be still distant about twenty miles from the southern front of the Himalaya chain. In these lofty regions, beyond Bhadrinath, stands the populous town of Manah, consisting of two hundred houses; the inhabitants of a different race from the generality of the mountaineers; and, from their broad faces, small eyes, and olive-coloured complexions, evidently of a Tartar origin. Seven hundred villages are said to be attached to the temple of Bhadrinath, whose sanctity may be estimated by the fact of no less than 40,000 pilgrims, chiefly fakirs, having visited it that year.

Not less holy in the estimation of the Hindus, though less frequented from the difficulty of access, is the source of the main stream of the Alkananda, named the Caligunga, near which is situated the temple of Kedar-nath, at an elevation of 12,000 feet nearly above the level of the sea. This place was not visited by Messrs Raper and Hearsay, but its height was ascertained barometrically by Captain Webb.

Though this expedition threw considerable light on the nature of the country between the plains of Hindustan and the southern base of the Himalaya Mountains, and succeeded in tracing two of the most considerable branches of the Ganges nearly to their sources, still the great chain of the Himalaya itself had not yet been approached, and the altitude of its various peaks above the level of the sea remained undecided. The account however given by Captain Raper (*Asiatic Researches*, vol. xii.) is full of interesting and important details.

The task of penetrating this vast chain was left to the exertions of a more daring traveller. Mr Moorcroft, accompanied by Captain Hearsay, the same who had been on the former expedition, and by a Hindu pundit of the name of Harkh Deo, set out with the hope of finding a passage across these mountains into the regions of Tartary, in order to purchase horses and the shawl-goat, and, at the same time, to collect such geographical information respecting these unknown regions as might fall within their reach. With the latter view, the learned pundit was engaged for the express purpose of *striding* over these mountainous regions, along the whole route, in regular paces of four feet each; a task which, it seems, he performed with exemplary patience and perseverance, across rocks, and rivers, and the most rugged precipices, without failing or faultering, except on one single occasion, where a piece of rock had slipped out of a narrow ledge on the very verge of a tremendous declivity, and left a gap just wide enough to show an abyss below, of a depth sufficient to appal the stoutest heart.

Beginning their operations at the point where the Dauli river falls into the Alkananda, they followed up the former to the very base of the Himalaya, and, after eighteen days of excessive fatigue, reached a gorge in the mountains, named the Nitee Ghati, or Pass of Nitee. At some distance below it was a small village of the same name, the great height of which was inferred by the hill, terminating the valley on which it stood, being tipped with snow on the 5th of June, and also by a quick breathing with which Mr Moorcroft was seized, and which obliged him to stop every four or five steps; he complained also of a sense of fulness in the head, accompanied by giddiness. In ascending the Ghaut, the difficulty of breathing increased, with great oppression about the heart; and, when on the point of falling asleep, a sense of suffocation was felt, and sighing became frequent and distressing. The same symptoms of oppression and debility were experienced by M. Saussure on the Alps, which he ascribed rather to the presence of carbonic acid gas, than to the tenuity of the atmosphere. We conceive, however, that the great height alone is sufficient to account for these symptoms.

At Nitee the travellers were informed that the passage of the mountains was never attempted before *Sancrant*, or the entrance of the sun into Cancer; they waited, therefore, till the 24th of June. For the last twenty days the thermometer at sun-rise was generally about 46°, at noon 72°, and from that to 80°; the nights were clear and serene; the birch trees and rose bushes were just then bursting into leaf, the furze coming into blossom, and the grain appearing above the ground.

The length of the Nitee Pass is about two miles; it leads to an elevated plain, to which there is little or no descent, called by the natives Undes or Ondes, which signifies "the country of wood." The name of Thibet was not known to them, and Captain Webb thinks it may have been derived from *Teiba*, which signifies, in the Gorkah language, "high-peaked mountains." The mountains crossing this plain, or rising in detached masses out of its surface, were covered with snow. The first, and indeed the only continued ridge seen by Moorcroft, was at the distance of about forty miles from the Himalaya, and nearly parallel to it, closing, however, gradually upon it to the eastward; but, at the distance of above eighty miles, they united, not far from the two lakes of Rawan-hrad and Manasarovara, which were separated from each other by a slip of land about four or five miles in width. The ridge thus uniting with the Himalaya is named Caillas, which is rather a generic term for any high mountain, than peculiar to a single one, and is among the Hindus what Olympus was among the Greeks.

The intermediate plain consists of a rugged stony surface, bristled in some places with rude shapeless rocks, and in others scooped out into broad and deep ravines, presenting on every side an extended dreary waste, without a tree or shrub to enliven the prospect, the only vegetation being confined to some low furze bushes, a woolly plant like everlasting, tufts of silky grass, and a species of moss, exhibiting a sickly green, among patches of snow and splashes of snow water. The only enlivening objects that appeared to Mr Moorcroft and his party were "two very beautiful poplar trees, in which were many goldfinches." These were on the banks of a considerable stream, flowing to the westward, down the middle of the plain, in the bed of which was a species of tamarisk, then in blossom, and reaching to the height of eight feet.

This river was then conjectured, and has since been ascertained, to be the Sutledge or Satudra. It rises in the lake Rawan-hrad, to the eastward of any of the sources of the Ganges, and, having collected in its western course the various streams from the northern face of the Himalaya, and the southern face of the Caillas, finds a passage through the former chain, near Mount Kantel, on the eastern side of Cashmere; and, on entering the plain of Hindustan, becomes the easternmost of the Punjab, or Five Rivers, the boundary of our Indian possessions to the westward; and, in its course to the southward, joins the Indus. This source and direction of the Sutledge can now be no longer doubted, as its course, which was ascertained by Mr Baillie Fraser to lie through the great range of mountains, has been traced back through the ravine of the Himalaya, and for a considerable distance to the eastward. On this elevated plain is situated the town of Deba.

Mr Moorcroft and his party having passed the first tableland, crossed the Caillas range, on the other side of which the rugged plain extended beyond the reach of sight. The numerous streams from the northern face of Caillas, uniting in the vale of Ghertope, form a river of considerable magnitude, which, from information, pursues a northwesterly course for some hundred miles, passes by Latak, and then crossing the Hindu Coosh, which may be considered as a prolongation of the Himalaya, to the westward of Cashmere, assumes the name of Indus or Scinde; of which great river it may be considered as one of the main branches, the other coming from the northward out of the mountains called the Moos-tag.

Mr Moorcroft did not ascertain what river or rivers flowed *out* of the lake Manasarovara, and seems to think that it has no outlet. This is very improbable, as its water was fresh, and there seems to be little doubt but the Sanpoo, or the main branch of the Brahmapootra, issues from its eastern extremity. In that case, this lake may be considered as about the highest part of the general level of the great plateau of Tartary.

Thus, by the exertions of intelligent travellers, the geography of the great mountainous buttress which supports the elevated regions of Thibet and Tartary has been pretty well ascertained; but all is still conjecture as far as regards an extensive range of country to the north, the north-west, and north-east of the Caillas range of mountains.

Neither the ancients, to whom the Himalaya Mountains were well known, nor the Hindus, to whom they have always been the cherished objects of veneration, nor our countrymen, who, from the plains of Bengal, had so often gazed at their snow-capped summits from a distance of 150 miles, ventured to form a conjecture even of their absolute height above the level of those plains. Mr Colebrooke, in his Note to Captain Raper's *Narrative*, observes that, "without supposing the Himalaya to exceed the Andes, there is still room to argue, that an extensive range of mountains, which rears high above the line of perpetual snow, in an almost tropical latitude, an uninterrupted chain of lofty peaks, is neither surpassed nor rivalled by any other chain of mountains *but* the Cordilleras of the Andes." Shortly after this, however, he thinks the observations of Captain Webb "authorize the opinion, that the Himalaya is the loftiest range of alpine mountains which has yet been noticed, its most elevated peaks *exceeding* the highest of the Andes."

The highest part of the Himalaya is about the centre of the chain, or between the source of the Bhagiruttee and the valley of Nepaul. From an observation taken by Colonel Crawford (when at Cathmandu, in Nepaul, in 1802) of very small angles at the extremities of a short measured base, it is concluded that one peak, called Dhaibun, rose to an elevation of 20,140 feet above the spot where the observation was made; which being itself 4500 feet above the level of the sea, would make the height of this peak 24,640 feet. By similar observations, the height of another peak was proved to be 22,319 feet, of another 24,525, another 22,952 feet, and of a fifth 23,162 feet, above the level of the sea.

But the peak which was found to possess the most extraordinary elevation was that called *Dhawala-giri*, or the White Mountain. By a mean of three observations, taken from the following computed distances, and seen under their respective angles, namely,

At station A, distance $89\frac{35}{100}$ miles. Ang. 2° 48′
——— B, ——— $102\frac{83}{100}$ —— —— 2° 19′
——— C, ——— $136\frac{35}{100}$ —— —— 1° 22′

and, by allowing for refraction, the height of this mountain is calculated at 27,677 feet above the plains of Gorak'hpur; which plains being 400 feet above the mouth of the Ganges, it follows that the whole height of Dhawala-giri must be taken at more than 28,000 feet above the level of the sea. By a subsequent calculation, however, the height of this peak was reduced to 26,862 feet. Of this and six other peaks, the following are the results of Mr Colebrooke's calculations, made from the observations of Captain Webb:

	Feet.
Dhawala-giri, "on the lowest computation"...	26,862
Jamunawatari, or Jamautri...	25,500
A mountain supposed to be Dhaibun...	24,740
A nameless mountain...	22,768
Another nameless mountain...	24,625
Another, near the last...	23,262
A third, in its vicinity...	23,052

These heights are probably exaggerated; it appears, indeed, that subsequent observations, made by Captain Webb, with an excellent instrument, from the extremities of a well-determined and sufficient base, have decided them to be so. They make, for instance, the height of the first "nameless mountain" in the above table only 21,000 feet above the plains of Rohilkhund, or 21,500 above the level of the sea, being a deduction from Mr Colebrooke's calculation, for the same mountain, of 1268 feet.

The following table exhibits the results of Captain Webb's corrected observations, of no less than twenty-seven different peaks of the Himalaya range, as taken in the progress of his survey of Kumaon, but for the accuracy of which he candidly admits it would be impossible to vouch, in all the circumstances under which the observations were taken. They are, however, in all probability, not far from the truth:

No. of Peak.	Altitude.	No. of Peak.	Altitude.
1	22,345	15	22,419
2	22,058	16	17,994
3	22,840	17	19,153
4	21,611	18	21,439
5	19,106	19	22,635
6	22,498	20	20,407
7	22,578	21	19,099
8	23,164	22	19,497
9	21,311	23	22,727
10	15,733	24	22,238
11	20,681	25	22,277
12	23,263	26	21,045
13	22,313	27	20,923
14	25,669		

After these trigonometrical deductions had been made, Captain Webb had the good fortune to succeed in making several barometrical observations in the Nitee Pass, through which Moorcroft had reached the plateau of Tartary. In his way thither he reached nearly the base of those lofty peaks of the Himalaya which tower above the temple of Kedar-nath, and the altitudes of which are amongst those previously determined by triangulation, at a great distance, and seen under very small angles. He had, however, at this place, the advantage of observing one of these peaks under an angle of 26° 15′ 15″; and this, he says, gave him a result that agreed as well as could be expected with the position and altitude he had formerly assigned to it. The temple itself, by the mean of five barometers, was found to be 11,897 feet above the level of Calcutta, or about 12,000 above that of the sea, yet no snow lay near it in the beginning of July.

Captain Webb next proceeded to Josimuth, near the commencement of the defile leading to the Nitee Pass, where he met with one of the civil servants of the East India Company proceeding on a mission to the frontier, with a view of opening a commercial intercourse with the Tartars. These subjects of China, however, declined all connection with us, and pushed forward picquets of cavalry to guard the pass. This untoward circumstance did not deter Captain Webb from proceeding. On approaching the pass he experienced the same difficulty of breathing which occurred to Moorcroft, and from the influence of which, he says, neither horses nor yaks are exempt. The natives call it *Bis-Kee-huiva*, or the poisonous atmosphere; and conceive it to be owing to the effluvia of certain flowers.

He found in the pass a troop of Tartar cavalry, who, with some inhabitants of Deba, received him kindly, and consented to let him remain until an answer should be received from Ghertope respecting his farther progress, which, at the end of fifteen days, was a negative, or, which amounted to the same thing, a reference to the viceroy of Lassa. He had been permitted, however, to proceed to the crest or highest ridge of the Nitee Ghaut, which is at or near its farthest extremity, and to make his observations, which are exceedingly interesting and important. On the 21st of August, at three P. M., by the mean of four barometers, the mercury stood at 16,27 inches, and the thermometer at 47°; and on the same day and hour, and the two preceding and following days, the state of the barometer and thermometer at Dumdum, about fifty feet above the sea, by a journal of the weather kept by Colonel Hardwicke, was as follows:

Aug. 19,	barometer 29,46 inches.	Ther. 88°
20	29,46	84
21	29,48	85
22	29,48	84
23	29,65	81
Mean	29,51	84·4

From which the Nitee Ghaut above Dumdum must be 16,764 feet, and above the sea 16,814 feet. Yet, at this extraordinary elevation, not a vestige of snow appeared in the Ghaut, nor on the shoulder of the ridge on the left of the pass, which rose to the height of 300 feet above it; and hence it would appear that the lower point of congelation, on the northern or Tartarian side of the Himalaya, is *not less than seventeen thousand feet.*

From the crest of the Ghaut Captain Webb was able to perceive the line of the Sutledge winding through the plain to the westward, and to take the angle of depression, from which, and Moorcroft's distance (generally found to be correct), he determined the elevation of this lowest part of the table-land of Thibet to be 15,924 feet. The angle of depresssion was 1° 28′ 10″, and the distance 15½ British miles. Notwithstanding this enormous elevation of 15,000 feet, the banks of the Sutledge afford the finest pastures for myriads of quadrupeds; and crops of a species of barley called *ooa*, from which the natives make their bread, are annually produced. Nay more; on the cheeks of the Nitee Pass plants were found that ripened their seed at the height of 17,000 feet. These singular anomalies, so utterly at variance with the theories of Humboldt, Leslie, Kirwan, and all European writers on the subject, can only be explained with reference to the great radiation of heat from that vast extent of elevated land that rises out of Central Asia like the boss of a shield, creating as it were a new atmosphere of its own. "As the heat," says the Baron de Humboldt, "of high regions of the atmosphere depends on the radiation of the plains, it is conceived that, under the same geographical parallel, one may not find in the system of transatlantic climates the isothermal lines of the same elevation above the level of the sea, as in the system of European climates." For the same reason, the system will apply still less to the climates of Central Asia. The same philosopher has observed, that the Cordilleras of the Andes, though they extend from north to south 120 degrees of latitude, are, generally speaking, not more than from two to three, and very rarely from four to five degrees in breadth; but the vast surface of table-land, supported by the great Himalaya buttress, stretching from Daouria on the east, to Belur-tagh on the west, through 47 degrees of longitude, and from the Altai on the north, to the Himalaya on the south, through a mean breadth of 20 degrees of latitude, presents a *plateau*, more or less elevated, equal to above three millions of square miles.

In confirmation of the great influence of radiated heat from extensive elevated plains, some strong facts are exhibited both in America and Asia. Thus, on the mountains which rise out of the elevated plain of Mexico, Humboldt observed the lower line of perpetual congelation, in lat. 19°–20°, at 15,090 feet above the sea, which, by the table of Professor Leslie, ought to have been at 13,560, making a difference between fact and theory of 1530 feet. The lower point on the side of Chimboraço, nearly under the equator, was 15,746 feet, being only 656 feet higher than on the mountains of Mexico; whereas, by Leslie's table, the difference ought to be 1729 feet. Compare, again, the height of this lower limit of perpetual congelation on the side of Chimboraço with the observations of Captain Webb in the Nitee Pass, and we have the extraordinary anomaly of a place in Asia, in 30° of latitude, having that limit higher by 1253 feet than another place in America immediately under the equinoctial line, and at 5500 feet, or more than a mile, higher than it ought to be in that parallel of latitude, according to the theory on which Professor Leslie constructed his table.[1]

It is right to observe, however, that the same anomaly exists, though in a less degree, on the southern face and abutments of the Himalaya range. Thus the elevation of Kedar-nath, at 12,000 feet, is below the verge of perpetual snow, which in Europe, on the same parallel of latitude, would be at 700 feet lower. Thus, also, the village and temple of Milem, in lat. 30° 25′, were not only without snow at the height of 11,790 feet, but extensive fields of buckwheat and Tartaric barley were growing at that elevation. In the same degree of latitude the same height in Europe would be some hundred feet within the limits of perpetual snow. At the same height, on the 21st of June, Captain Webb's encampment was surrounded with flourishing woods of oaks, of the long-leafed pine, and the arborescent rhododendron, and the surface was clothed with a rank vegetation. On the following day he determined the elevation of Pilgointi-Churhai Pass to be more than 12,700 feet above the sea; yet even here no snow was visible, but the black soil was clad with creeping plants; and the shoulder of a mountain rising still higher was without a vestige of snow, and appeared, as far as could be seen through the mist, enamelled with flowers. The reflected heat from the perpendicular face of the immense mass of naked rock, on which snow cannot rest, exposed to the rays of a south-western sun, will probably be deemed sufficient to explain the anomaly which is found to exist on the southern side of the chain.

---

[1] See the article CLIMATE.

Of the geological strata of these mountains we have not as yet full information. Mr Baillie Fraser, who penetrated to the very base of the great chain, at the head of the Jumna and the Bhagiruttee branches, describes the first and inferior hills of sandstone, more or less destructible, of indurated clay, with beds of rounded pebbles and gravel. The second ridge of hills, rising to the height of 1500 to 5000 feet, are sharp, rough, and run into numerous ridges, divided by deep shaggy dells; and the crests of the ridges are frequently so sharp that two persons can hardly stand abreast upon them. Beyond these are a mass of hills entirely composed of limestone, of a round, lumpish, rugged character, whose highest points may be from 5000 to 7000 feet. Next to these commences the schistus, or slate, which continues to the very roots of the Snowy Mountains. All above appeared to be striated hard grey gneiss, and a compact granite, which, Mr Fraser supposes, is the material which constitutes the highest ridges and crests of this great mountain range; but schistus is the rock that mostly predominates. Hot springs are found on both sides of the Himalaya; and copper, lead, and iron, are commonly met with. Gold is also found in the beds of the rivers. Captain Webb obtained the petrified bones of an animal of the deer kind, which were dug out of a bed of gravel, on the side of the Caillas Mountain, at least 16,000 feet above the level of the sea, a height at which, it may safely be asserted, no other organic remains have hitherto been discovered.

For some further statements of the height of the highest peaks of the Andes, as compared with those of the Himalaya chain, see the article Asia.

HIMILCO, a celebrated navigator of Carthage, a contemporary of Hanno, and equally distinguished for his maritime discoveries. He was the first who ventured to traverse the Northern Ocean, and to examine the shores of Great Britain; but the details of this voyage, which must have been remarkable for its boldness at that early period, have nearly disappeared in the lapse of years (Plin. ii. 67). Festus Avienus, in his work entitled *Ora Maritima*, has preserved to us a few particulars, which, as it is the earliest notice taken of our island, it may be interesting to give: "Here is the point of a high ridge, called in ancient times Œstrymnis; the whole lofty mass of rocks faces the warm south. In front of this promontory opens the bay Œstrymnicus, in which are found the islands Œstrymnides, rich in tin and lead. The country is populous, and the inhabitants are remarkable for their pride, their active industry, and their commercial spirit. They traverse, in small boats made of skins, the boisterous sea and whirlpools of their ocean, abounding in sea monsters. Two days sail, you reach the island of the Hiberni, and near them you have the island of Albion." The Œstrymnides are evidently the Scilly Islands, which were afterwards called Cassiterides. This voyage is supposed to have taken place in the sixth century before the Christian era.

Himilco, a senator of the Barcine or popular faction at Carthage, who warmly supported the policy of Hannibal in attacking the Romans in their own country. The successful battle fought 216 B. C. at Cannæ, was to him a convincing proof of the correctness of their policy, and he did not fail to take advantage of this opportunity to inveigh loudly and sarcastically against the gloomy predictions of his opponents, and the more cautious policy which they recommended. (Liv. xxiii. 12.) The severe defeats sustained by the Romans in Italy had shaken the fidelity of even their more faithful allies, and it was not to be expected that their more distant conquests in Sicily could be retained without a complete supremacy of power. Many of the cities in that island had abandoned their cause; and Himilco, who commanded the fleet at Pachymnon, 214 B. C., returned to Carthage to press on the attention of the executive the necessity of more decisive measures. His representations were attended to, and he landed at Heraclea with a force which he imagined to be sufficient to drive the Romans from Sicily. He took the city of Agrigentum, but his subsequent success was by no means equal to the sanguine expectations he had entertained. Marcellus still maintained his position before the city of Syracuse, and the fearful example he made of the people of Euna prevented even the most disaffected cities from openly declaring in favour of the Carthaginians. (Liv. xxiv. 35–39.) At last the critical position of Syracuse imperatively required some efforts to be made for its relief, and Himilco, with his colleague Hippocrates, suddenly took up positions so as to render the besiegers the besieged. The boldness of this proceeding was not followed by measures sufficiently vigorous. A pestilential fever succeeded, which attacked the Carthaginians with more severity than the Romans, and Himilco, with the whole body of his countrymen, fell a victim to its ravages, B. C. 212. This melancholy end of Himilco was the death-knell to the liberties of Syracuse. (Liv. xxv. 26.)

HIN, a Hebrew measure of capacity for things liquid, containing the sixth part of an ephah, or one gallon two pints English measure.

HINCKLEY, a town of the hundred of Sparkenhoe, in the county of Leicester, 100 miles from London. It is built on an eminence in a fertile country, and is chiefly inhabited by persons employed in the hosiery trade. There was formerly a castle, now converted into a modern dwelling, and a Benedictine monastery; and the town must once have been of greater extent than it is at present. There is a well-supplied market which is held on Monday. The population amounted in 1801 to 5070, in 1811 to 6058, in 1821 to 6706, and in 1831 to 6468.

HINDIA, a district of Hindustan, in the Mahratta territories, in the province of Khandesh. It is situated between the twenty-second and twenty-third degrees of north latitude, and is bounded on the north by the Nerbuddah, and on the south by the Cattygong hills. The country is fertile. Hindia, the capital of this district, is a fortified town, and is pleasantly situated on the northern bank of the Nerbuddah river. Long. 77. 10. E. Lat. 22. 31. N.

HINDON, a borough-town of the county of Wilts, formerly a part of the parish of East Knowle, in the hundred of Downton. It is ninety-six miles from London, has a small market on Thursday, and its population amounted in 1801 to 793, in 1811 to 781, in 1821 to 830, and in 1831 to 932.

HINDONE, a town of Hindustan, in the province of Agra. It was formerly a large city, but has suffered severely from the depredations of the Mahrattas. Long 77. E. Lat. 26. 45. N.

HINDU Coosh, or Kosh, a portion of the Himalaya range of mountains, in Afghanistan. They form the north-west boundary of the province of Caubul, separating it from Balk and Buduckshan. The range of mountains so denominated extends in a south-westerly direction as far as the snowy peak of Hindu Coosh, nearly north of Caubul. These mountains are covered with snow the greater part of the year, and void of verdure at the summit, but are well wooded at the base. They form the Caucasus range of the ancients. From the peak of Hindu Coosh the height diminishes; it no longer bears perpetual snow; and it is soon afterwards lost in a group of mountains which stretch in length from Caubul to Herat in Persia, and occupy more than two degrees of latitude in their breadth. Through these mountains there are seven passages; the principal of which are at Bajaruch, Anderab, Tool, Bamian, and Abderah.

HINDUSTAN.

HINDUSTAN has from the earliest ages been celebrated as one of the most highly favoured countries on the globe, and as abounding in the choicest productions both of nature and art. In ancient times, this distant region was very imperfectly known to the Greeks and other nations of the West; but they imported its most valuable produce, its diamonds, its aromatics, its silks, and its costly manufactures. The country which abounded in those expensive luxuries was naturally reputed to be the seat of immense riches, and every romantic tale of its felicity and glory was readily believed. In the middle ages, an extensive commerce with India was still maintained through the ports of Egypt and the Red Sea; and its precious produce, imported into Europe by the merchants of Venice, confirmed the popular opinion of its high refinement and its vast wealth. After the discovery of a passage to India by the Cape of Good Hope, the same ideas still prevailed; and the maritime states of Europe contended with their fleets and armies for the dominion of the Asiatic seas, and for the commerce of the country. The Portuguese, and afterwards the Dutch, made important conquests, and carried on an extensive trade. In later times, Great Britain and France appeared on the field as competitors for the prize of Indian commerce and dominion, and were allowed to establish factories on the coasts for the reception and the store of goods. These were gradually converted into military posts, defended by soldiers and cannon; and in due time those two powers were ranged on opposite sides in all the wars and politics of India. This contest terminated in the triumph of the British arms. France lost her pre-eminence on the continent of India; and her great rival, enlarging her power on every side, gradually rose to greatness and dominion, and now rules with undisputed sway from the Himalaya Mountains to Cape Comorin. This vast extension of the British power in the East has opened the way into the interior of India. It has tended greatly to enlarge our knowledge of this distant region; and if more accurate inquiry has reduced the marvellous tales of its glory and greatness within the bounds of sobriety and truth, Hindustan, the seat of industry, of commerce, and of the arts, when Europe was sunk in barbarism, the scene of many eventful revolutions, from the Mahommedan invasion till its conquest by the armies of Britain, and inhabited by a people of peculiar manners, laws, institutions, and religion, still presents a wide field for interesting inquiry and speculation.

In the following account of this interesting country, we propose to describe, I. Its geography and natural features; its produce, its animals, its manufactures and commerce; the numerous races by which it is inhabited, with their manners, religion, and policy; and the wars and political revolutions which have terminated in establishing the sway of Great Britain over nearly the whole continent of India. II. The transactions and internal policy of the East India Company, with the various reforms introduced into the revenue, judicial, and police departments, will afford ample materials for a separate discussion and inquiry. And, III. A brief account will be given of the constitution, commercial privileges, and pecuniary transactions of the Company, originally merchants, now the sovereigns of a vast empire.

Ge raphy. I. The ancient geographers had no precise ideas of the extent of Hindustan or India, terms which we mean to use synonymously in the following article; and they accordingly extended its frontier westward as far as Persia, and eastward to China. In after ages its limits often fluctuated with the events of war, and served only to mark out the course of conquest, with little or no attention to geographical accuracy. Yet in no part of the earth has nature pointed out, in the great features of the country, more distinct and magnificent boundaries. On the north it is separated from the elevated table-land of Thibet by the precipitous wall of the Himalaya Mountains, the highest land of the Asiatic continent; on the west the Indus divides it in its course to the sea from Afghanistan; while the great river Brahmapootra may be said to constitute its eastern boundary, or, more accurately perhaps, that range of hills and forests that skirt the Bengal districts of Chittagong and Tipperah, and stretch southward to the point where the Brahmapootra, after having long flowed in a westerly course, makes a sudden sweep to the south. The Indus and the Ganges discharge themselves into the ocean on the western and eastern coasts of Hindustan, in about 24° and 25° north latitude; and to the south the country is contracted into an irregular triangle, projecting into the Indian Ocean to within eight degrees of the equator, or about 1000 miles, and on all sides enclosed by the sea. The extensive region situated within these limits is nearly comprehended between the 8th and 35th degrees of north latitude, and between the longitudes of 68° and 91° east; and its length from the northern barrier of the Himalaya Mountains to Cape Comorin is about 1900 miles, whilst in breadth it may be estimated at 1500 miles, though, owing to the irregularity of its figure, it does not exceed 1,280,000 English square miles.

Natural features. Hindustan is of an extremely diversified aspect, and comprehends within its bounds all the varieties of climate, of soil, and of natural scenery, from the bare and naked rock, and lofty mountain buried under eternal snows, to the low and fertile plain, scorched by the tropical sun, and the seat of luxuriant vegetation. This diversity in the aspect of the country has given rise to the following territorial divisions, namely,

1. Northern Hindustan, which comprehends the Himalaya Mountains on the north, with their lower ranges of hills, extending southward to the great plain of the Ganges; and which includes Cashmere on the west, and the country of Bootan on the east.

2. Hindustan Proper, which extends southward as far as the Nerbuddah river, where the Deccan commences, and which includes the following provinces, namely, Bengal, Bahar, Allahabad, Oude, Agra, Delhi, Lahore, Cashmere, Ajmeer, Moultan, Cutch, Gujerat, and Malwah.

3. The Deccan, bounded on the north by the Nerbuddah river, and on the south by the rivers Krishna and Toombudra, comprehends the provinces of Gundwana, Orissa, the Northern Circars, Khandesh, Berar, Beeder, Hyderabad, Aurungabad, and Bejapoor.

4. India south of the Krishna river, comprehending the provinces of Canara, Malabar, Cochin, Travancore, Balaghaut Ceded Districts, Mysore, Coimbetore, Salem and the Barramahal, and the Carnatic.

1. The alpine region of Hindustan, which forms its northern barrier, is a narrow strip of land not exceeding 150 miles in breadth. It is here that the land of Asia attains to its height; and the country is composed of a succession of vast mountains rising far above the level of perpetual snow. These frozen deserts consist in many places of rugged and bare rocks, shooting aloft into the sky, and divided by deep ravines, very steep, and often ending in dark chasms, which are sometimes wooded, but as often bare rocks several hundred feet in height, with little more space between them than has been worn by the violence

of the torrents. Here is concentrated all that is sublime in the scenery or phenomena of nature. On every side are to be seen snowy summits of stupendous height, and of every form; the conical volcanic peak; the mountain regularly rounded, or broken into rugged and frightful precipices, rising upwards to a tremendous height, or descending with a frightful declivity into deep hollows, and all covered with snow. This mountainous and frozen region is the scene of the destructive avalanche, when the accumulated snows of successive winters are precipitated from the mountains into the plains below, burying every thing in their progress; or when the action of the intense cold upon the solid rock rends it from its base, and sends it bounding down the steep, producing the most fearful ruin of every thing beneath. Mr Moorcroft, who in the year 1816 penetrated across the Himalaya ridge, mentions the tremendous crash from the fall of a rock, which he heard at a great distance. The slope of a hill he also saw broken from top to bottom. "In its fall," he observes, "it has overwhelmed large trees, of which some have been hurled into the river, others lay across its bed half buried in rubbish, and others, thrown down, were seen hanging by their roots with their heads towards the base of the mountain." The southern face of the Himalaya Mountains is much more steep than the northern descent into the tableland of Thibet, and it is in proportion difficult and dangerous. There is nothing like a road in these mountainous districts. The traveller has to scale the most terrific heights, by a path so narrow as not to admit two abreast, which winds along the mountain, and often along bare and perpendicular precipices, by a narrow and irregular flight of steps, or by natural irregularities in the face of the polished marble rock, and sometimes by a projecting ledge not more than a foot broad, whilst a declivity of 600 or 700 feet in depth opens on the outer side. These steps, at certain projecting points, where the rock is perpendicular, wind in lines of zigzag not more than ten or twelve feet in length, at angles so sharp that, in a length of twenty-four feet, the actual height gained is not more than ten feet, and they are often placed at most inconvenient distances, which greatly increases the danger and the difficulty of access, except to those hardy mountaineers who have been trained from their infancy to agility and steadiness in such tremendous paths. Mr Moorcroft himself had on one occasion a narrow escape. "My left foot," he says, "having slipped off one of these irregularities, I lay for a few seconds upon the poise; but a snatch at a clump of grass, which on being seized did not give way, and a sudden spring, brought me to a comparatively safe spot, with the loss of some skin from my knees and elbows, and some rents in my trowsers and sleeves."[1] His Hindu attendants encountered the same perils, and one of them had very nearly fallen down the precipice. On missing his footing, he mentions that "he shrieked violently, and sunk down almost senseless upon a point of stone, with one leg hanging over the abyss, calling out that he was lost." Another of the bearers was so alarmed that he was incapable of proceeding until he was secured by a turban tied round his waist, and held by one of his companions. In some places the rock was found to project to the edge of the river, and it was turned by rude staircases made of wood and stone, or the path lay over immense stones and rocks, piled up in dangerous disorder, where it was very difficult to secure a footing; whilst in other places the party had to aid their ascent by laying hold of shrubs, roots of trees, clumps of grass, and clods of earth, or by creeping on both hands and knees to prevent slipping down. Yet the heavily loaded native carriers, each carrying a weight of 60 pounds, are seen descending these difficult passes with apparent ease and unconcern.[2] Lieutenant Webb, who in 1808, along with Captains Raper and Hearsay, was sent to explore the sources of the Ganges, experienced the same dangers as Mr Moorcroft, and was finally compelled to desist from his hazardous journey when he had reached within six or seven days' journey of Gangoutri. The country here assumes a savage wildness, and, except in the passes or beds of the rivers, is totally impervious; and these rivers, in approaching their sources, from rapid and turbulent streams flowing over a rocky channel, become furious torrents, dashing from one huge block of stone to another, along which the traveller, climbing over rocks, or picking his dangerous way along the path of precipices, as already described, is at last met by masses of mighty ruins, which entirely check his further progress. More recently these wild regions have been explored by that enterprising traveller Dr Gerard, who crossed the great Himalaya pass, and penetrated into the plateau of Tartary. The abstract of his tour, given in the Asiatic Journal, is replete with valuable information, and confirms all the previous accounts of travellers respecting the nature of the country, rude and inaccessible, and exhibiting, on a scale of grandeur hardly to be conceived, all the great phenomena of nature.

The Himalaya Mountains contain the sources of the great rivers which flow through the burning plains of Hindustan. The deep valleys between the mountains are the channels through which the waters flow from the higher grounds; and, by the melting of the snow, those streams, suddenly swoln into torrents, and rushing down the declivity, work out a deep and narrow channel amongst the rocks, where, imprisoned as it were between steep and perpendicular banks, they roar and foam amidst precipices, or in dark and unfathomable glens, exhibiting, in the conflict of their troubled waters, all the great phenomena which belong to rivers, namely, the cataract, the rapid, the boiling eddy, and the dangerous whirlpool, and only subside into smoothness when they break out and spread over the plains. Huge rocks were seen by Dr Gerard whirled along with frightful velocity; nothing visible but an entire sheet of foam and spray, thrown up and showered upon the surrounding rocks with loud concussion, and re-echoed from bank to bank with the noise of the loudest thunder. Across these streams are thrown rude bridges made of ropes or of wood, the usual expedient by which rivers are crossed in all mountain countries. Where the breadth of the river is small, the passage is effected by one or two fir spars laid across from rock to rock; but where the space is wider, a bridge of ropes is constructed, on the principle of the chain bridge. In attempting the passage by one of these rude bridges, a carrier who accompanied Fraser in his journey to the sources of the Ganges unfortunately lost his footing and fell into the water. He was instantly swept down the stream to its junction with the Bhagiruttee, about fifty yards, "when his head," says the traveller, "appeared for a moment, and his load floating beside him; but the foaming current of the Bhagiruttee, here tumbling over large rocks with a mighty roar, seized him and hurried him along with its tremendous torrent."

The height of the great Himalaya range has been fixed by accurate measurements at between 26,000 and 27,000 feet above the level of the sea. According to the accounts of all travellers, these mountains present from the plains below one of the sublimest aspects in nature, and they are at a loss for words to express the admiration and awe with which they are first beheld. Bishop Heber mentions that the nearest range rises into a dignity and grandeur which he was not prepared for, divided as it is into successive ridges, in all the wildest and most romantic forms of ravine, forest, crag, and precipice. In his further progress he found "one range of mountains after another quite as rugged, and, generally speaking, more bare than those which we had left, till the horizon was terminated by a vast range of ice and snow, extending its battalion of white shining spears from east to west, as far as the eye could follow it; the principal points rising like towers in the glittering rampart, but all connected by a chain of humbler glaciers." Captain Raper, who accompanied Lieutenant Webb in his survey of the Ganges, viewed the Himalaya ridge from a summit about 4000 feet above the lower plain. "From the edge of the scarp," he observes, "the eye extended over seven or eight distinct chains of hills, one rising above the other, till the view was terminated by the Himalaya or Snowy Mountains. It is necessary for a person to place himself in our situation before he can form a just conception of the scene. The depth of the valley below, the progressive elevation of the intermediate hills, and the majestic splendour of the cloud-capt Himalaya, formed so grand a picture, that the mind was impressed with a sensation of dread rather than of pleasure."[1] "The stupendous height of those mountains," says Elphinstone, "the magnificence and variety of their lofty summits; the various nations by whom they are seen, and who seem to be brought together by this common object; and the awful and undisturbed solitude which reigns amidst their eternal snows, fill the mind with admiration and astonishment that no language can express."[2]

---

[1] See Moorcroft's Journal, *Asiatic Researches*, vol. xii. p. 386.

[2] Fraser, *Journal of a Tour through part of the Snowy Range of the Himalaya Mountains.*

Northern Hindustan varies in its climate and in its aspect with the height of the ground. The lower ranges of mountains, though they scarcely reach the level of perpetual snow, still retain the sublime features of alpine scenery; namely, the rugged and bare mountain, the craggy rock, white, gray, red, or brown, springing up in fantastic forms above the general mass; and the deep and suddenly descending chasm, with the foul torrent foaming over its rocky bed. The luxuriant foliage is wanting which embellishes the lower hills; the rich and smiling valley is not so often seen; whilst the forests of dark brown fir fringing the mountains and the hollows impart a sombre and unvarying appearance to the scene. At a lower level the country improves; and though it still exhibits the mountain and the precipice, the intervening valley is clothed with verdure, and the lower hills with the most magnificent forests of large and lofty trees, the open country with roses, jasmines, and other lovely or odoriferous shrubs, and with the most luxuriant alpine plants.[3] The valleys through which flow the head waters of the Indus and the Ganges, namely, the Sutlege, the Pabur, the Jumna, the Bhagiruttee, the Alkananda, with their tributaries, exhibit all the varied and sublime scenery of this romantic country. The valley of the Sutlege is hemmed in by brown and barren mountains, steep and rocky, without the grandeur of lofty precipices or fringing wood. The hollows through which it receives its tributary streams are dark chasms, without cultivation; the heights crowned with forts, but without any neat villages surrounded with trees to relieve the adjacent desert. The banks of the Jumna, on the other hand, though rocky and wild, are wooded and green, and the sloping faces of the hills fertile and well cultivated; and even at its source, the country, however wild and picturesque, is still not nearly so dreary as the valley of the Bhagiruttee. The features of the landscape are here lofty, rugged, and inaccessible, with less of the beautiful than of the sublime and terrible. A pleasing contrast to this wild scenery is presented by the smiling valley through which the Pabur meanders, chequered as it is with pasture and crops, and the banks and the hills clothed with cultivation, villages, and wood. Such is the usual aspect of the lower valley of Northern Hindustan, the height of which is for the most part from 3000 to 6000 feet above the plains. The difference between the northern and southern exposures of this mountainous country is remarkable, not only in the formation and structure of the hills and rocks, but in the vegetation. The country on its southern face is of a brown and dusky colour; the grass short and parched; the hills rough and lumpy, with rocks standing through the ground; the lower parts bare of wood; and above, the Weymouth pine, with a few stunted larches sprinkled amongst the rocks; whilst the higher parts are spread over with oak, holly, and alder, their leaves of brownish green, harmonising with the burned appearance of the hills, and giving a sombre hue to the whole scene. On the northern exposure a rich colour of dark green is diffused over the whole landscape; the rocky sides of the glens are bolder and grander; and they are clothed with noble forests of larch, silver, and spruce firs, which shroud from the view the highest and steepest cliffs. "All," says Fraser, "was rich and dark; and here and there a glade opened, or a high slope extended from the base of the rock, or projected between two streams, of a bright beautiful green, shining through the sombre forest." This difference between the northern and southern exposures is strongly marked all over the hills.[4]

That strip of flat country, about twenty miles in breadth, which lies at the base of the great Himalaya range, dividing it from the plain of the Ganges, is called Terrae or Terreeana. It is covered with thick forests and low swamps, and, though fertile, is so unhealthy that it is little cultivated. Bishop Heber graphically describes it as a long, black, level line, extending at the foot of the lowest hills, "so black and level," he adds, "that it might seem to have been drawn with ink and a ruler." This flat does not extend farther north-west than through a portion of Rohilcund, where the healthy cultivated country reaches to the foot of the hills, which rise abruptly from the sandy flat beneath. These low hills are watered by streams from the higher mountains, that rise to the level of 1500 or 5000 feet, from which this lower range is frequently separated by fine valleys of some length, which are called *doon* by the natives, answering to the Scottish name of *strath.* The hills which rise beyond this lower range to the height of about 5000 to 7000 feet, are lofty and majestic, and broken into numerous ridges, divided by deep shaggy dells. This appearance Fraser ascribes to the quality of the rock of which they are composed, which consists of a strongly indurated clay, with a mixture of siliceous matter, forming a rock exceedingly hard, though easily destructible by exposure to the air, and splitting into variously-sized fragments, leaving hard marbly masses staring through the scanty soil. It may be finally remarked of this singular and interesting country, that though it appears from the plains to be divided into distinct ranges or terraces, it is really a vast collection of mountains heaped in masses one above another, without any order or plan that can be discovered, until the height of land is reached at the great Himalaya ridge, which extends from beyond the sources of the Indus in a continuous chain far into China.

The great plain of Hindustan presents an entirely different scene. The cold and bracing air of the upper country is there exchanged for burning heat; the mountain torrents no longer rage, except when they are in flood, but roll their streams lazily over the plains. That large tract which is contained between the Indus and the Brahmapootra, and which extends east and west from 1200 to 1400 miles, and about 300 or 400 miles from north to south, is, with few exceptions, a level country, consisting chiefly of the great plain of the Ganges, rich and fertile, and clothed with the most luxuriant vegetation, in which the spreading palm, with groves of mango and other trees of the most luxuriant foliage, and gardens, are intermixed with cultivated fields. The noble river which intersects this extensive plain determines the aspect and character of the country. Its swelling stream, as it approaches the sea in the provinces of Bahar and Bengal, is very broad and deep, and waters so completely the whole country, that in the driest season there is scarcely any part more than twenty miles distant from some river; and by means of lakes, rivulets, and water courses, boats may approach the peasant's door. During the annual inundation, a large tract of cultivated country is submerged to a great depth; and the lower part of the Delta, named the Sunderbunds, is chequered by a labyrinth of creeks and rivers, expanding to a breadth of two hundred miles; the actual inundation reaching a breadth of one hundred miles, in which trees and villages are seen like islands appearing above the water. Higher up the stream the inundation is diminished in extent; and in the province of Bahar the river is not above a mile broad, the country being flat and fertile, though not so abundant in trees as the rich plains of Bengal. Towards the west, the plain watered by the Ganges and its tributary streams yields in abundance all the productions of the tropics; especially the Dooab, or the tract that lies between the Jumna and the Ganges, the provinces of Allahabad and Agra, and in general all the alluvial tracts near the rivers. At a distance from these, irrigation is resorted to by the cultivators, and deep wells are dug. The plain is diversified by ranges of hills, with abrupt peaks occasionally shooting up, and crowned with forts, in which, during the decay of the Mogul empire, the rebellious or robber chiefs sought to secure a precarious independence. The plain of Hindustan is generally fertile when water can be obtained; and, as it approaches the mountains, in the northern provinces of Oude and Delhi, and is watered by the numerous streams flowing towards the Ganges, it is flat, fertile, and rich, except towards the western borders of Delhi, on the verge of the great desert, where sterile tracts occur, without cultivation or inhabitants. Towards the south-western portion of the plain, near the Nerbuddah, in the province of Malwah, the country is of greater elevation, but has a regular descent from the Vindhya Mountains, which extend along the north side of the river, as is pointed out by the course of the numerous streams that still flow northward into the Ganges. But the aspect of the country changes as it recedes from this great stream; the overflowing river no longer spreads over the plain, and forms a navigable water-course; it is now merely a mountain torrent, of no depth to float down the produce of the country. Westward, in approaching the Indian Ocean, wild tracts occur, hilly and rocky, and overgrown with jungles, the haunts of wild beasts and of robbers; and, still further west, the province of Cutch is a cold, sterile waste, half covered with a salt morass called the Runn. In the interior of Hindustan, large and fertile tracts have been laid waste by misrule, or the devastations of war: these are overrun with a rank vegetation, which quickly springs up under the quickening influence of a tropical sun; and which, consisting of tall trees with spreading branches, interwoven into an impenetrable fence with brushwood, and with innumerable shrubs and creeping plants clinging round the trees, and lacing them firmly together, forms thick jungles, affording abundant cover to the wild animals of the country, and to gangs of banditti, who are even more ferocious than the beasts of the field.

Hindustan, as well as almost all other tropical countries, would soon be changed, by the great heat, into deserts of sand, like a large portion of Africa, if it were not refreshed by the periodical rains and the overflow of the rivers. In the plain of Hindustan, towards the west, occurs a tract of this description, which, having neither rains nor refreshing streams, still remains an arid sand. This great desert reaches northward as far as the Chinaub, one of the five tributary rivers of the Indus, and to the south as far as the salt lakes of Cutch, which communicate with the Gulf of Cutch in the Indian Ocean. It extends about five hundred miles from north to south, and is about four hundred miles in breadth, encroaching eastward on the cultivated parts of the Delhi and Agra provinces, and westward on the country fertilized by the Indus. Mr Elphinstone, in his journey to Afghanistan, travelled across this waste, which he describes as consisting mostly of hillocks of loose and deep sand, from twenty to a hundred feet in height, which in summer are blown aloft in clouds by the wind, and threaten to overwhelm the traveller. Here a miserable village is sometimes seen, which is merely a few round straw huts, with low walls and conical roofs, like little stacks of corn, surrounded by hedges of dry thorny branches stuck in the sand. A few fields, watered by the dews and the rains, surround these abodes of misery, and yield crops of the poorest kinds of pulse, and coarse grain. Water is scarce, and is only obtained from wells often three hundred feet deep, with a diameter of only three feet, and all lined with masonry. One was seen by Mr Elphinstone of the enormous depth of 345 feet, with such a scanty supply of unwholesome brackish water, that the whole was drawn out, by two bullocks turning the water wheel, in a single night. In this sandy desert springs up in profusion the most juicy of all fruits, the water-melon. From about the western frontier of Ajmeer, at Shekawutty, to Bahawulpoor, the distance is 280 miles, of which the western portion, for 100 miles, is wholly destitute of inhabitants, water, and vegetation. In the Punjab, the abundance of water corrects the sterility of the soil; and in the country watered by the five well-known rivers which flow into the Indus, cultivation, with waving grass and trees, marks the termination of the desert. In the north-western extremity of Hindustan, high up the Indus, and embosomed amongst lofty mountains, is situated the Valley of Cashmere, celebrated in oriental tales for its romantic beauty. Here the eastern princes, in the days of their prosperity, were wont to retire, and to seek in those sequestered scenes of natural beauty a brief oblivion of their daily cares.

The country to the south of Nerbuddah, namely, the Deccan, extending north-west and south-east 800 miles, comprehends the whole breadth of Hindustan, between the Nerbuddah on the north and the Krishna or Kistnah river on the south. The western range of the Ghaut Mountains, rising up with the steepness of a wall from the shore of the Indian Ocean, runs along the coast southward from the river Taptee, as far as Cape Comorin, and forms the highest land, only about seventy, or in some places forty miles, from the western shore; whilst on the opposite side the distance eastward to the coast is from three to six or seven hundred miles. Owing to this conformation of the ground, all the rivers of any size or length of course, such as the Godavery and the Krishna, which water the Deccan, and the Conjeveram and the Cavery, which belong to Southern India, roll down the eastern declivity of the Ghauts, there being no space on the western declivity for the formation of any other than a mountain stream. These mountains also diverge in ridges across the country of the Deccan, which on the eastern coast is low, flat, and sandy, with the exception, however, of the tract between the Godavery and Kistna or Krishna rivers, 150 miles in length, along the sea shore, and forty miles broad, composed of rich vegetable mould, such as is usually found at the mouths of rivers, and remarkably fertile. In the interior, the country, especially towards the north, is wild, woody, mountainous, and overrun with thick jungle; in some parts, as in the province of Gundwana, it is a primeval wilderness, inhabited by barbarous tribes, who owe their safety to their poverty. Towards the south and the west, in the provinces of Hyderabad, Beder, and Berar, the ground rises into a table-land, which declines towards the north in the province of Khandesh; and it is hilly, though not mountainous, well watered, and in many parts fertile; but towards the south, large tracts have been desolated by war and robbery; and ruined towns, and wasted fields overgrown with jungle, still remain, the sad memorials of those calamities. The western provinces of Aurungabad and Bejapoor extend towards the Indian Ocean, and include the Western Ghauts, which rise to the height of about three thousand feet above the level of the sea. They abound in all the interesting aspects of mountain scenery, and are studded with fortresses and natural strongholds. The eastern declivity stretches out into a table-land, with plains well watered and productive; whilst the intervening strip of land, from the mountains to the sea, is in general flat and sandy, but improves as it approaches the mountains, which are fringed with noble forests of teak and other valuable trees. Numerous mountain streams, but no rivers of magnitude, make their way to the sea from the Western Ghauts; and there are few coasts so much broken into small bays andhar bours, with so straight a general outline.

To the south of the Kistna river, the country forms a triangle, of which this river is the base, and the coasts of Coromandel and Malabar the sides. Its extent from the Kistna to Cape Comorin, which is the point of the triangle, is 600 miles; and its breadth in the widest point is about 550. It may be shortly described as a table-land 3000 feet in height, containing the central provinces of Balaghaut, Mysore, and Coimbetore, and enclosed on each side by the Western and Eastern Ghauts, from which the country descends on both sides to the sea; on the east to the Bay of Bengal, and on the west to the Indian Ocean, forming the two provinces of the Carnatic and of Malabar; the latter a narrow strip of low country, extending 200 miles along the coast, much broken, and interspersed with back-water runs and extensive ravines, shaded with forest and jungle, and filled with population; the former also a long narrow tract, stretching 570 miles along the shore, and nowhere more than 120 miles in breadth, and commonly not more than seventy-five. The Eastern Ghauts extend from the Cavery to the Kistna. They are not so high as the western range; and naked, sun-burnt, and rocky peaks are more commonly seen amongst them. The table-land in the centre descends both towards the north and south, its elevation in the southern province of Coimbetore not exceeding 900 feet. It is extremely diversified with woods, waste, and jungles; and cultivation is here, as in other parts of India, carried on by means of large tanks containing a supply of water for the irrigation of the land. In descending from the hills into the southern plains of Travancore, which extend to the Indian Ocean, the country presents a varied prospect of hill and dale, and winding streams which clothe the valleys in perennial green; and the grandeur of the scene is heightened by the lofty forests which cover the mountains, producing pepper, cassia, frankincense, and other aromatic gums.

The following are the chief rivers of Hindustan, with the length of their respective courses to the sea:—Indus, 1700; Brahmapootra, 1650; Ganges, 1500; Jumna (to its junction with the Ganges 780), 1500; Sutlege (to the Indus 900), 1490; Ghylum (to the Indus 750), 1250; Gunduck (to the Ganges 450), 980. In the Deccan and south of India, the Godavery, 850; Kistna, 700; Nerbuddah, 700; Mahanuddy, 550; Tuptee, 460; Cavery, 400. There are few coasts of such extent, so destitute of islands and harbours as that of Hindustan. With the exception of emerged sea banks and mere rocks, Ceylon is the only island near its shores; and on the eastern coast, Masulipatam, which admits vessels of 300 tons burden, is the only harbour for large vessels between Trincomalee in the island of Ceylon, and the Ganges, which is free from a raging surf. To this inconvenience Madras, though an important British settlement, is peculiarly liable. On the western coast, the only harbour capable of admitting large vessels is Bombay; Mangalore admits no vessels drawing more than ten feet, and this only at the height of the tide.

Climate.

Hindustan comprehends within its bounds the opposite extremes of heat and cold. The plains are burnt up with intense heat; whilst winter, with every intermediate variety of temperature, prevails in the mountains. Philosophers have in vain endeavoured to fix the point of perpetual congelation under different degrees of latitude. They have indeed framed a graduated scale of the respective heights at which, according to calculation, this point should begin at corresponding distances from the equator. But theory is here at variance with actual observation. The climate of mountainous tracts depends so much on localities and the particular course of the winds, as to baffle all general speculation. Hence in the Himalaya Mountains harvests of grain are found, where, according to hypothesis, the ground should be buried under deep snow, and trees are seen to flourish in the regions of perpetual winter. Captain Webb, in ascending the Himalaya range, saw around him, at the height of 11,630 feet above the level of Calcutta, rich forests of oak, pine, and rhododendra, the ground covered with vegetation as high as the knee, strawberry beds in full flower, and currant bushes in blossom; and in 1818, at the Niti Pass, 16,814 feet in height, philosophy was again at fault, as the ground was clear of snow, though above the line of perpetual congelation, and many quadrupeds were feeding on the grassy banks of the Sutlege. It was remarked by Dr Gerard that vegetation attained a higher level on the northern than on the southern face of the Himalaya ridge, where the extreme height of cultivation is 10,000 feet; the limit of the forest 11,800 feet, and 12,000 feet that of bushes. On the northern side cultivation rises to the height of 11,400 feet; in other places to 13,600 feet; birch trees to 14,000 feet; and tama bushes, which form excellent fuel, to the height of about 17,000 feet. In Northern Hindustan, great and sudden changes of temperature occur, which is the cause of pulmonary affections. During summer, the thermometer, which is often in the morning at 32° or under it, rises to 70°, 75°, and 80° or upwards during the day: the winters are, however, uniformly severe. In this also, as in other hilly countries, the traveller may be fainting to-day under a tropical sun, and shivering to-morrow amidst the rigour of perpetual snows. From the banks of the Sutlege, where the thermometer frequently stands at 100° and 108°, three days climbing will carry him into the regions of winter.

Seasons.

In the plains of Hindustan, the heat during the greater part of the year is unintermitting and intense; except where it is modified by the ranges of mountains, or the table-lands towards the west. The seasons here are commonly divided into the hot, cold, and rainy. The spring and the dry season throughout the valley of the Ganges last about four months, the heat gradually increasing with the season, until, in May and June, the thermometer rises to 100°, and frequently in the interior to 108° and 110°, when it is almost intolerable even to the natives, and still more so to Europeans, who resort to various modes of alleviation, such as the *cuscus tatty*, which is a frame of wood, interwoven with twigs, between which is distributed a layer of a particular kind of sweet-scented grass. This being hung before an open window, in the quarter of the prevailing wind, and constantly moistened on the outside by a water-carrier, diffuses a refreshing coolness. Bishop Heber, however, thought it more effectual to shut out the external air, by which, and by agitating the air within by punkahs, a slight frame of wood, covered with silk or with canvass, and suspended from the ceiling, and swung backwards and forwards by servants, hé reduced the temperature to 85° within doors, although it was at 100° without. Thus imprisoned, he complains that in going to an open window or door, "it is literally like approaching the mouth of a blast-furnace." This raging heat is modified by occasional thunder storms from the north-west, termed north-westers, which, however terrific, refresh the air and the ground, and give new freshness and luxuriance to the grass, and to the shrubs and trees. Milder showers also occur, which refresh the atmosphere. In the western provinces of Allahabad, Agra, Delhi, &c. a parching wind very frequently blows from the west during the hot season, and, during the night, is succeeded by a cool breeze from the opposite quarter, sometimes for days and weeks by easterly gales; and as these parching winds prevail, refreshing breezes and cooling showers of rain and hail are more rare. Those remarkable winds, the monsoons, which blow half the year from the south-west and the other half from the north-east, exercise a powerful influence on the climate and seasons of Hindustan. The periodical rains are ushered in by the south-west monsoon, which commences about the beginning of June in the south of India, and somewhat later towards the north. Mr Elphinstone, in his account of his journey to Afghanistan, gives a just and forcible description of the phenomena which accompany the change of the seasons in those eastern countries. "The approach of the monsoon," he observes, "is announced by vast masses of clouds that rise from the Indian Ocean, and advance towards the north-east, gathering and thickening as they approach the land. After some days, the sky assumes a threatening appearance in the evening, and the monsoon in general sets in during the night. It is attended by such a thunder storm as can scarcely be imagined by those who have only seen that phenomenon in a temperate climate. It generally begins with violent blasts of wind, which are succeeded by floods of rain. For some hours lightning is seen almost without intermission; sometimes it only illuminates the sky, and shows the clouds near the horizon; at others it discovers the distant hills, and again leaves all in darkness, when in an instant it re-appears in vivid and successive flashes, and exhibits the nearest objects in all the brightness of day. During all this time the distant thunder never ceases to roll, and is only silenced by some nearer peal, which bursts on the ear with such a sudden and tremendous crash, as can hardly fail to strike the most insensible with awe. At length the thunder ceases, and nothing is heard but the continued pouring of the rain and the rushing of the rising streams. The next day presents a gloomy spectacle; the rain still descends in torrents, and scarcely allows a view of the blackened fields; the rivers are swollen and discoloured, and sweep down along with them the hedges, the huts, and the remains of the cultivation, which was carried on, during the dry season, in their beds." After some days the sky clears, and discloses the face of nature changed as if by enchantment. The fields, formerly parched, are now covered with luxuriant verdure; the clear and burning sky is varied and embellished with clouds; the rivers are full and tranquil; the dust which loaded the atmosphere, and which made the sun appear dull and discoloured, has now disappeared; and the parching wind, like the blast from a furnace, and the still more sultry calms, have been succeeded by a pure and delicious air. Intermitting rains now fall for about a month, when they come on again with great violence, and in July are at their height. During the third month they rather diminish, but are still heavy; and in September, and at the end of the month, they depart amidst thunders and tempests as they came.[1] About eighty inches of rain fall in Bengal during the rainy season.[2]

The dense masses of clouds which arise on the Indian Ocean are carried forward by the south-west monsoon over the plains of Hindustan, as far as the Himalaya Mountains. On the coasts they descend in deluges of rain, which diminish as they recede from the sea, unless where the vapours are intercepted by high mountains, when they pour down in torrents of rain on the plains beneath. But in Southern India, the south-west monsoon is intercepted by the double chain of the Western and Eastern Ghauts, by which the mass of clouds being as it were cut in twain, is carried forward on the north and the south sides of this mountain wall, going clear of a considerable tract to leeward of the Eastern Ghauts, namely, the coast of Coromandel, which is thus free from the periodical rains which fall in all other places of Hindustan. The western range of the Ghauts, though it checks, does not altogether impede the passage of the clouds; and we find accordingly, that in the table-land of Mysore and the neighbouring countries, the south-west monsoon brings on the rains, though they are not so violent nor of such long continuance as in Bengal, and on the western shores of India. But those light and elevated clouds which pass the Western Ghauts, being stopped in their progress by the eastern chain, or descending in rain on the intermediate table-land, never reach the Coromandel coast; and here, accordingly, on the eastern side of the mountains, the dry season prevails, when it rains on the table-land of Mysore to the west, and still more heavily on the Malabar shore. On the other hand, it is the north-east monsoon which, in the Bay of Bengal, sets in about the middle of October, with thunder and lightning and violent hurricanes, that ushers in the rains on the Coromandel coast, which continue to the middle of December, and sometimes to the 1st of January, whilst at this period southerly gales and fair weather prevail on the opposite coast of the Indian peninsula. It was formerly supposed that the Ghauts, interrupting the progress of the south-west monsoon, occasioned a diversity of seasons through a great part of India. But it is only that limited track of country to the leeward of the Eastern Ghauts that is free from the influence of the south-west monsoon, which accordingly brings on the rainy season at the mouth of the Godavery, immediately to the north. Major Rennell suggests that those clouds may be blown by the south-west monsoon from Cape Comorin; though he afterwards adds that this is not his opinion, because the cape bears south-south-west from the mouth of the Godavery, and the reigning winds are much more westerly.[3] But the true reason seems to be, that the eastern chain of the Ghauts does not extend so far north; hence they afford no shelter to the country at the mouth of the Godavery, which thus lies in the direct course of the south-west monsoon. To the north of the Ghaut Mountains, in the parallel of Surat, the south-west monsoon, meeting with no interruption, carries its supplies of moisture over the whole face of the country. The periodical rains accordingly extend over the great plain of the Ganges. They commence on the coast of Malabar in May, farther north in June, where they are not so violent; at Delhi they do not come on till the end of June; and a much smaller quantity of rain falls than at Bombay or Calcutta.[1] Near the sea the clouds are still in a deep mass, and descend in deluges of rain; but they are exhausted as they go; the rains become weaker and weaker, and are at last diminished to a few transient showers in the south of the Punjab. On the sea-shore the south-west monsoon extends into Beloochistan, and thence into Mekran, the easternmost province of Persia, where the clouds being arrested by mountains, descend in heavy rains. They pass with little obstruction over the countries of Lower Sind; but being intercepted by the mountains of Upper Sind, they occasion the principal rains of the year.

[2] Martin's *History of the British Colonies*, vol. i. p. 91.

[3] *Memoir of a Map of Hindustan*, p. 214.

The eastern provinces of Hindustan, including Bengal and the mountainous countries of Bootan, Nepaul, and the other contiguous provinces, are not dependent on the rains that come across the country from the Indian Ocean, which would be very scanty at so great a distance from the sea. Of the mass of clouds driven before the south-west monsoon, that portion which passes Cape Comorin on the south is carried north-eastward across the Bay of Bengal, until, meeting with the mountains that join the Himalaya from the south, of which they are indeed a continuation, they follow their direction, and are thus diverted from a north-easterly into a north-westerly course; and it is from this quarter accordingly, namely, from the south-east, that Bengal and the adjoining provinces receive the rains fresh and abundant from the ocean. Part of these clouds make their way over the first hills, and bring on the rains in Nepaul and Thibet; and part passing to the north-west, water the plains of Bengal, the southern face of the Himalaya Mountains, the countries which lie to the north of the Ganges, the northern parts of the Punjab, and, in their progress to the north-west, the southern declivity of the Cashmere Hills, and the plains beneath, though they scarcely make their way over these hills into the Valley of Cashmere. They continue their progress westward to Afghanistan, where they gradually become weaker, and only produce occasional showers. The cold season, which succeeds the rains, lasts from November to the middle of February; and during all this period the air is clear, and the thermometer is from 65° to 84°. In Southern India the heat is greater than in Bengal. In the Carnatic the thermometer ranges from 100° to 106°, and the cold season is of very short duration. On the table-land above the Ghaut Mountains, as at Coimbetore, among the hills, the temperature in the cold season is from 31° to 59°; in summer 64°, 65°, and 75°, or even higher. On the table-land in which Bangalore in situated, the thermometer seldom rises above 82°, or falls below 56°.

Ve table
pr ce.

Hindustan comprehends all the known varieties of the vegetable tribes. The mountainous tracts of Northern Hindustan produce all the alpine plants, and the various species of European grain, fruits, and flowers. Deep woods cover those lower ranges of mountains, in which are found the pine tree of various species, "the tallest, straightest, and most magnificent," says Fraser,[2] he ever beheld; the larch, the silver, and the spruce fir, from the bark and twigs of which resin exudes in abundance; the yew tree; several species of oak, holly, alder, sycamore, birch, with mulberry and chestnut trees. Here is also found the mimosa tree, from which is made the catechu or Indian rubber; the resinous part of this fir, cut into slips, answers the common uses of the lamp. These noble forests extend over immense tracts, and would afford inexhaustible supplies of timber, if they could be transported to the proper market. Fruits in great variety are also produced in this elevated region, such as apricots, peaches, and grapes, apples, pears, currants, raspberries, blackberries, and strawberries; roots, such as turnips, carrots, garlic, onions; flowers and plants, as roses, both red and white, lilies of the valley, jasmines, butter-cups, yellow, blue, and white cowslips, sweet briar, with numerous other beautiful and fragrant plants. The valleys exhibit, according to their altitude and temperature, the productions of Europe or of the tropical countries. At the height of 6000 feet appear the oak and the pine; at that of 3000 feet rattans and bamboos of enormous dimensions; in some parts the pine-apple, the orange, the sugar-cane, grow to maturity; in others, barley, millet, and similar grains are produced. The lower part of these hills is the seat of the saul forests. The lower valleys yield rice sown broad-cast, maize, wheat, barley, pulse of various kinds, sugar-cane, cotton, Indian madder, a large species of cardamum, besides other productions. The pastoral tribes of Northern Hindustan feed considerable flocks on the lower hills and valleys; in summer they climb the alpine country, and browse on the herbage adjacent to the region of perpetual frost.

The vegetable produce of the plains in Hindustan, and of the southern provinces, is the same as in all tropical countries. The soil, where it is copiously watered, is fertile; and if the country were one unvaried level, the copious rains would afford a sufficient supply for every spot. But, from the inequalities of the surface, the lower parts are frequently overflowed, whilst, in the higher grounds, vegetation is burnt up. To secure a more equal distribution of water, various contrivances are resorted to. It is retained in extensive plains by means of dams, or in reservoirs constructed of stone, or in ponds and water-courses, whence it is distributed over the land. But these beneficial works, so essential to agriculture, are in a dilapidated state. Their construction conferring a reputation for piety, they have been uselessly multiplied; and not being duly repaired, they are soon filled with aquatic plants, putrid water, bad smells, and pernicious exhalations. One of these tanks, seen by Dr Buchanan, is stated to be eight miles long and three broad. "I never viewed a public work," he observes, "with more satisfaction, a work which supplies a great body of people with every comfort which their moral situation will permit them to enjoy."[3] The Hindu, though he is a most industrious, is not a skilful cultivator; his implements are of a very rude kind; and even if he had the skill, he has not the capital necessary for an improved system of husbandry. The ploughing in Hindustan is quite different from any thing seen in this country. The plough has no contrivance for turning up the earth, nor has the share sufficient depth to stir a new soil. Several ploughs in succession deepen the furrows, or rather scratch the surface. The branch of a tree, or some other equally rude substitute for a harrow, is then employed to pulverise the soil, and prepare it for the seed. The plough is drawn by oxen, and in Southern India by buffaloes. The field, after it is sown, must be protected for several days by a person exalted on a bamboo stage, against the depredations of numerous flocks of birds, and still longer in woody districts, from the havoc of wild elephants, buffaloes, and other animals. The harvest is reaped by the sickle, the scythe being unknown. There is no occasion for stacking rice, which is completely preserved by the husk. The grain, after it is winnowed, is stored in jars of unbaked earth, or in baskets made of large twigs. In Benares and the western provinces, and also in the south of India, it is stored in subterraneous granaries; but in the damp climate of Bengal it is hoarded above ground. The rotation of crops, so essential to the husbandry of Europe, is not known in Bengal; nor are the articles for cultivation ever selected with any view to restore the exhausted powers of the soil. The land is never properly manured. The Hindus, from their limited use of animal food, are no extensive breeders of stock. The labouring cattle are either pastured on small commons, or fed at home on cut grass; and those for the dairy graze in numerous herds in the forests or on the downs. The dung is accounted holy by the superstitious Hindus, and is either converted to religious uses, or into fuel, and sold. In Bengal no manure is used; and, in the southern provinces, only a small quantity of ashes and dried vegetables. Oil-cake is sometimes employed as a manure for the sugar-cane. The ryot or husbandman is generally poor, deriving only a bare subsistence from his labour; the greater part of the produce of the land being taken for the government tax. Under the extortions of the eastern governments, whether native or British, a thriving farmer could hardly exist.

Rice is the great staple of agriculture throughout Hindustan, in the plain of the Ganges as well as in Southern India. It is sown at the approach of the rains, and it is gathered during the rainy season, about the end of August; the last crop is sown during the same season, and is gathered in the beginning of December. It is esteemed the best, not being equally liable with the other to decay. The diversity of soil and climate, and the several seasons of cultivation, have given rise to infinite varieties in this species of grain. When the rains fail throughout Hindustan, which occasionally happens, the rice crops are apt to be deficient to a degree altogether unknown in the well-regulated agriculture of Europe, where the severest scarcity hardly ever raises the price of corn more than three times its usual rate. But the famines of Hindustan leave thousands without subsistence, and fill the land with scenes of misery and death. In the great famine of 1769, it was estimated that three millions of the people perished; the air was so infected by the noxious effluvia of dead bodies, that it was scarcely possible to stir abroad without perceiving it, and without hearing also the frantic cries of the victims of famine, who were seen in every stage of suffering and death; whole families expired, and villages were desolated; and when the new crop came forward in August, it had no owners. Bengal has been less liable to famines since this period, but they very frequently occur in other parts of India. Rice thrives well in the inundated track of the Ganges; and in Southern Hindustan, especially on the low lands of the sea-coast, higher up the Ganges, wheat and barley are more generally cultivated, also in the high grounds and elevated table-lands of Southern India. Other kinds of grain are cultivated, such as Indian corn; and great varieties of pulse and coarse grains, such as peas, beans, chiches, gram, vetches, and raggy, which is the most important crop raised in the dry field, and in some parts of Southern India is the subsistence of all classes, in others of the poorer classes. These are important articles of cultivation, as they have each their particular season, and thrive even on poor soils. Maize is the general produce of poor soils in hilly countries, and is commonly cultivated in the more western provinces. Millet and other grains are also cultivated, and, vegetating rapidly, and in every season, they fill up profitably for the farmer the short intervals between the other modes of cultivation in Lower Hindustan. Sugar is everywhere cultivated, and at less expense, by the Hindu cultivator, though sometimes a slave, than by the slaves of the West Indies; and it is on this account burdened in Britain with a heavier import duty than the expensive sugar of the West Indies, by which means, under the baneful influence of monopoly, we favour one colony by crushing another. Though formerly unknown in Europe, sugar has been produced in India from the remotest times, and was thence transplanted into Arabia, whence it has been introduced into Europe, Africa, the West Indies, and America. It grows luxuriantly throughout all the valley of the Ganges and in the plains of Southern India, and could be produced, with the help of European skill and capital, to meet any demand. It thrives more especially in Bahar and Benares, and in particular districts of Bengal. Opium is the peculiar and staple produce of the province of Bahar, and is also extensively cultivated in Malwah, and in other parts of Hindustan. It is a precarious crop, producing alternately high profits and heavy losses. The liquor extracted from the poppy is collected as it exudes, and is then placed in pots, where it is dried and formed into lumps, in which process it loses from one tenth to one eighth of its weight. The opium produced in Bahar and Bengal being monopolized by the East India Company, and bought at a fixed price, is a contraband article of trade, and its cultivation is confined to certain districts. But it is nevertheless clandestinely imported into Bengal, and sold in considerable quantities. In Malwah a treaty was entered into with the different rulers and chiefs, by which the monopoly was extended to that country, and all that was produced delivered to the Company, at the rate of three rupees a seer, which is two pounds. But so great was the discontent excited by this extension of the monopoly, that, at the desire of the chiefs, the treaties were rescinded in 1819–1820; and the trade in opium, and its cultivation, is now free in that province, and everywhere throughout India, except in the Company's dominions, which renders it impossible to maintain a strict monopoly, more especially as the opium of Malwah, having of late years been greatly improved in quality, and rivalling, and even surpassing, the best opium produced in Bahar, is brought into competition with the Company's opium in all the foreign markets, and especially in China.[1] The cotton plant has from time immemorial been one of the staple products of Hindustan, and is indigenous from Ceylon in the south, to the Himalaya Mountains. It is cultivated extensively throughout Bengal, and in the interior provinces on the banks of the Jumna; also in the Deccan, and in Southern India, whence it is imported into Bengal, and into Mirzapoor, in the district of Benares, where it is manufactured. Flax and hemp are also cultivated in several districts both in the north and in the south of India. Silk was long the exclusive product of India and China. Silk worms are now reared principally in the district of Burdwan, and in the vicinity of the Bhagirati and in the Ganges, and for about 100 miles down their streams. Four crops of mulberry leaves are obtained in the year, the last in December. A considerable quantity of silk, of a coarse kind, is obtained from wild silk worms, which do not feed on the mulberry, and are found in the forests of Silhet, Assam, and the Deccan. Indigo was originally a product of India; and the plant was afterwards carried to South America, whence Europe was for a long time supplied with this dye. The manufacture on which the quality of the indigo depends was very unskilfully conducted until the year 1783. Since this period it has been so much improved by the skill and capital of Europeans that it is now a staple article of commerce, and in Bengal the annual produce amounts to about nine millions of pounds. Indigo is produced generally throughout the plain of the Ganges, and in Southern India, but chiefly in Bengal. Tobacco, formerly unknown in India, and introduced from America probably about the beginning of the seventeenth century, is now extensively cultivated in every part, chiefly however in the northern provinces, and more rarely in the south. The tobacco grown in the Mahratta territories is most esteemed; particularly that which is produced near Bilsea, a town in Malwah. Bengal does not yield good tobacco; but the Company's territories in Guzerat, being principally of a rich black soil, are considered as peculiarly suitable to its cultivation.[1] The Hindus having been already in the habit of inhaling the smoke of hemp leaves, and other intoxicating drugs, readily adopted tobacco as a more agreeable substitute, and it soon came into general use. Their recent knowledge of it appears from their having no name for it which is not a corruption of some European term. Pepper, though of inferior consequence, is a valuable product of Southern India, especially of Malabar. It is produced from a species of vine which is made to twine round the jack tree. It bears fruit about the third or fourth year, amounting to from three to seven pounds weight, and yields two crops in the year. The areca nut and betel leaf, universally chewed by the natives, thrive in the low grounds, where water is abundant; and cardamums, a spice in great repute. The universal and vast consumption of vegetable oils in Hindustan, for food or unguents, or for the lamp, is supplied by the extensive cultivation of mustard seed, linseed, sesamum, palma christi, besides what is procured from the cocoa nut. The first ripen in the cold season, the sesamum during the rains, or soon afterwards.

The forests in the low plains of Hindustan, of Southern India, and those which cover the western range of the Ghauts, and more sparingly the Eastern Ghauts, abound in the most valuable trees, applicable to many important uses. The extensive woods in Southern India supply the teak tree, valuable for ship-building; and in Malabar, these forests are the private property of the Nairs, by whom they are often sold or mortgaged to the dealers. Saul, sissoo, toon, and bamboo trees abound; the last of which yields a medicine much used by the native doctors, and which sells for its weight in silver. There are many species of the palm tree, with its luxuriant and spreading leaves, of which the produce is extremely useful. The cocoa-nut tree is in some provinces an important article of culture. The kernel is used for food by the richer natives, either in its raw state, or dressed after various fashions; and it yields by far the finest oil in India, if the nut be fresh and the oil quickly used. Extensive tracts, many miles in length, are planted with the cocoa-nut and betel-nut palms. Many other species of timber are found in the deep recesses of the woods, of which Dr Buchanan, in his account of Mysore, gives a particular description, with the botanical names of the different trees, and to his work we refer; observing generally, that the woods consist of every description of timber, black, heavy, and strong, and adapted for the beams and posts of houses; other kinds are white, hard, and durable, and adapted to all the purposes for which strong materials are required; some are beautifully grained, and take a fine polish, and are well suited for furniture, or exude resins and gums of a sweet scent, that are used in temples for incense; the wood of some kindles readily into a clear light, and is used for torches.[2] Other kinds of wood are employed for dyeing. The sandal wood is valuable for its perfume, and for the essential oil which it yields. It requires a strong soil, and it is twelve years before it attains the proper size for being cut. The billets of wood are prepared by being buried in the dry ground for two months, when the ants eat up all the outer wood, leaving the heart, which is the sandal. The deeper the colour the higher the perfume. The whole sandal wood of Hindustan is now in possession of the rajah of Mysore, who succeeded to a small portion of Tippoo's dominions, and of the British government.

The climate of Hindustan, owing to the long and heavy rains of summer, is not so favourable for many kinds of fruit which are not ripened by the previous heat of the spring. Orchards of mango trees diversify the plains of Bengal, and are common all over Hindustan; the palmyra and the date tree abound everywhere, and especially in Bahar. The former thrives remarkably well in dry barren spots, and is prized for the tari or wine which it yields. The bassia, which yields an intoxicating spirit, also suits the poorest soils, and abounds in the hilly districts, where the oil expressed from its seeds is a common substitute for butter. The other fruits are the plantain, the lime, the sweet and bitter orange, the guava, the pomegranate, the jack, the tamarind, &c. Under the shade of lofty flower and fruit-bearing trees, and the luxuriant bamboo, and the rank weeds which shoot up along with them, the natives, from shyness, bury their cottages, and especially their females, from the view of strangers; and the damp vapour from the confined air, the loathsome and pernicious animals which harbour among the trees and weeds, and the filthy habits of the natives, are generally sufficient to repel Europeans from their habitations. The Hindus cultivate in their kitchen gardens a variety of esculent vegetables and roots. But, of the European vegetables, the potato alone is suited to the climate, and is of as good quality as that which is produced in England. Asparagus, cauliflower, radish, onions, and other esculent plants, are raised; but they are comparatively tasteless.[3]

Animals.

Hindustan, from the great extent and inequality of its surface, its stupendous and snow-clad mountains, and its vast and wooded plains lying under a burning sun, comprehends all the most interesting forms of animal life; more especially those animals of the tropical regions remarkable for ferocity or size, which have been the subjects of scientific research as well as of popular curiosity in all ages, and which find ample cover in the deep woods and jungle-covered wastes of those tracts of the country which have been desolated by tyranny or war. A minute or systematic inquiry into so important a branch of natural history cannot within our limits be attempted. All that we can propose is a brief and popular sketch of the principal animals which give to the zoology of India its distinct and brilliant character. The elephant, which holds a conspicuous place in the animal creation, is seen in all parts of Hindustan, and ranges wild in its deep forests and jungles. This animal, from its size and strength, was employed in the ancient wars, and the prodigious momentum of its charge often turned the tide of battle. The richly caparisoned elephant is still used to swell the gorgeous parade of the Asiatic courts, and is at the same time, from its patience and docility, the humblest of domestic drudges. An elephant is about thirty-five inches high when newly born, and does not attain his full growth of ten or ten and a half feet, or twelve feet when the head is set up, until the age of twenty or thirty years. In length he is about fifteen or sixteen feet. The rhinoceros is between five and six feet high, in length eight feet, the whole body covered with a thick and nearly bare skin, in irregular folds, and the head, at least of the Indian species, armed with a single horn. The rhinoceros is strong and active, of peaceable habits; but when he is hunted he turns on his pursuers and resists fiercely. The Bactrian camel with two humps, so useful in traversing the sandy wastes of the torrid zone, and the dromedary with a single hump, formed more lightly for speed, are natives of Hindustan. The deer is found in all its varieties, from the large and powerful mountain stag, with its well-compacted form, to those lighter forms of the antelope species which sport so gracefully in the woods and in the burning plains. The musk-deer, so named from the perfume contained in a small bag situated in the lower region of the abdomen of the male, is a solitary dweller in the mountain tracts of Hindustan and of Central Asia, amidst ice and snows; it is shy and timid, and seldom approaches the lower region of the pine forests. This animal has no horns; the horned tribe are, however, numerous. The Nepaul stag has a short tail, short horns, and two small antlers at the base. Deer of a large size abound in Bengal, and also in Southern India, in the forests of the Ghaut Mountains. One species, with branching horns, attains to the size of a horse. The black deer of Bengal is about fifteen or sixteen hands high; it is a bold, fierce, and powerful animal; dark brown in the upper parts of the body, and in winter of a shining black; whitish in the belly, with a ring of white round the nostrils and mouth. The spotted deer, with large antlers, ranges all over India, and abounds in the forests of Bengal, and along the banks of the Ganges. The hog-deer is known in Bengal and in the northern parts of India; and the roe-buck in the hilly districts, and still more among the Ghaut Mountains in the south. There are, besides, numerous other varieties of the deer species. Hindustan contains several species of the antelope; one about twenty inches in height, and nearly three feet in length, with four horns, haunts the western forests and hilly tracts in the valley of the Ganges. The white antelope, between three and four feet in height, and of surpassing swiftness, ranges along the banks of the Ganges and the Indus, and over the intervening deserts; and another species, with one horn, and an abundant covering of wool, is a native of the mountain and icy regions of the Himalaya. Of the feline tribe, the lion claims the first place. He is considered as the lord of the brute creation; and his whole appearance, the flowing and shaggy mane, the ample forehead, the kindling eye, and the muscular strength and compactness of the whole frame, so powerfully armed by nature for the purposes of destruction, concur to give an idea of majesty and power, which is further strengthened by the boldness and courage with which, instead of seeking a dastardly retreat in the forest or the jungle, he rushes forth to confront his enemies in the open plain, where he is generally shot by the hunters. But, in the event of his being only wounded, he is extremely formidable, from his vast strength and fierceness, and the immense weight of his body, especially towards the head, and the power of his tremendous claws.[1] The lion is not nearly so common in Asia as in Africa, and is only found in the northern provinces of Hindustan.[2] The tiger is the more common animal of India, abounding in all the forests and jungles, from the mouth of the Ganges to the Himalaya Mountains. He is not quite equal in strength to the lion, though superior in activity; and his undulating movements have more of ease, grace, and bounding elasticity; whilst his bright-yellow, tawny-coloured skin, variegated with dark stripes, shaded with white in the under parts, completes this beautiful specimen of the animal creation. Since the British have acquired possession of India, they have so eagerly pursued the sport of tiger-hunting, that the animal has been driven from the inhabited parts of the country into the vast jungles which line the great rivers, and which may be considered as the game preserves of Hindustan. The leopard and the panther are found in the woods; the former animal in such numbers, that during the marches of the British troops in 1803, amongst the deep forests at Cuttack, in the province of Orissa, many of the sentinels were carried off by them in the night. The bear abounds in all the wooded mountains; also wolves, which at Cawnpore, where there is a British encampment, are so numerous that they frequently dash into some corner of the camp, and carry off children under five years of age, who happen to be straggling amongst the huts. The other wild animals are hyenas, jackals, foxes, hares, porcupines, hedgehogs, monkeys in great variety, and prodigiously multiplied by the superstitious Hindus, who consider them as sacred animals, to the great annoyance of Europeans. The wild boar, which inhabits the woods and jungles of India, is a fierce animal, and very destructive to the corn fields and sugar plantations. It affords excellent though sometimes dangerous sport to the hunter, when it turns on its pursuers. The wild dog of the Himalaya Mountains is a remarkable animal, in form and fur resembling a fox, though stronger and larger. Bishop Heber saw one of these animals which had been taken, and was exceedingly wild and fierce. They hunt in packs, give tongue like dogs, and have a very fine scent; and they are said to attack and, by dint of numbers, to destroy the tiger. They are highly valued in these countries.[3] Dr Gerard observed a pack of these wild dogs stealing along a gulley quite red. The buffalo, both wild and tame, is a native of India. There are different species, one of which (the Bos Arnee) is noted for its gigantic dimensions, its great strength, and its horns, which are nearly six feet in length, by the aid of which it is a match for and frequently repels the fiercest tiger. Dr Buchanan, however, insists that this is merely the common buffalo in its wild state.[4] The yak, or ox of Tartary, particularly described by Turner in his account of his embassy to Thibet, is numerous among the Himalaya Mountains, where they browse in herds, amidst ice and snow; and constitute, next to corn, the wealth of the inhabitants.[5] It has a downcast, heavy look, and is fierce and of a suspicious temper. The Cashmere goat has been long celebrated for the soft silky nature of the wool found at the root of its long hair, which is manufactured into shawls. The other animals in the alpine regions of Hindustan are also provided with a similar covering of soft wool. "The cow," says Moorcroft in his Journal, "has a material of the same kind, not much inferior in warmth and softness; the hare has her fur of peculiar length and thickness; and even the dog has a coat of fur added to his usual covering of hair."[1] The goat bred in Southern India, called the maycay or long-legged goat, mentioned by Dr Buchanan, is also of quite a different breed from the common goat. There are other breeds remarkable for long and curiously-twisted horns. The native horse of India is a small, ill-shaped, vicious pony, the finest horses being imported from the countries to the west of Hindustan. But wild horses are seen in herds in the northern mountains. The sandy desert in the west of Hindustan is the haunt of the wild ass; as he is described in Scripture, "his house the wilderness, and the barren land his dwelling." This animal is found in herds of sixty or seventy on the banks of the Runn, the great salt morass or lake of Cutch, where it browses on the brackish and stunted vegetation of the desert. When caught, as it sometimes is by the natives in pits, it is fierce, untameable, and bites and kicks in the most ferocious manner. Its form is that of the mule rather than of the ass; its body is of an ash colour, changing to a dirty white under the belly. It is larger than the tame ass, stronger and more active, remarkable for shyness, and still more for speed, throwing out, at a shuffling trot peculiar to itself, the fleetest horses in the pursuit.[2] In Southern India, the ass, of which there are several varieties as to colour, is very commonly tamed for domestic purposes; some are of a black hue; and there is a species of milk-white ass, though it is rare.[3] The rat tribe abound in Hindustan; and one species is of enormous size, the tail above a foot long, and very mischievous, burrowing to a great depth in the ground, making its way under the foundations of stores and granaries, and perforating the mud or unburnt brick walls of the native cottages.

[1] Heber's *Journey*, ii. 170.

[2] "The lion," says Bishop Heber, "which was long supposed to be unknown in India, is now ascertained to exist in considerable numbers in the districts of Saharunpoor and Loodianah. Lions have also been killed on this side of the Ganges, in the northern parts of Rohilcund, in the neighbourhood of Moradabad and Rampoor, as large, it is said, as the average of those in the neighbourhood of the Cape of Good Hope. Both lions, where they are found, and tigers, are very troublesome to the people of the villages near the forest, who, having no elephants, have no very effectual means of attacking them with safety. The peasantry here (in the province of Delhi) are not a people to allow themselves to be devoured without resistance, like the Bengalese; and it often happens, that when a tiger has established himself near a village, the whole population turn out, with their matchlocks, swords, and shields, to attack him. Fighting on foot, and compelled to drive him from his covert by entering and beating the jungle, one or two generally lose their lives; but the tiger seldom escapes." Heber mentions, that he derived his information from Mr Boulderson, who was a keen sportsman, and had long been in India, and who said that he had seen some skins of tigers which "bore the strongest marks of having been fought with, if the expression may be used, hand to hand, and were in fact slashed all over with cuts of the tulwar or short scimitar." (Heber's *Journey*, vol. ii. p. 149.)

Bir

The ornithology of India, though it is not considered as so rich in specimens of gorgeous and variegated plumage as that of other tropical regions, still contains many splendid and curious varieties of the feathered race, as well of those that are clothed in nature's gayest attire, far surpassing the richest dyes of art, as of that other class, the birds of prey, distinguished by strength, size, and fierceness. The parrot tribe are the most remarkable for beauty. So various are the species, that we cannot even enumerate them, and must refer for details to the scientific works on the subject. Of the birds of prey, the eagle or the condor, which haunts the inaccessible crags of the great Himalaya range, is the most remarkable; Bishop Heber mentions that one of these animals was shot at Dega by Lieutenant Fisher, with whom he conversed; and, from the bareness of its neck, resembling that of the vulture, the form of its beak, which is longer and less hooked than the eagle's, and from its extraordinary size, he judged it to be the condor. It measured between the extended wings thirteen feet; its talons were eight inches in length; its colour was a deep black. According to Heber, children are sometimes carried away by this animal from the streets of Almorah.[4] Eagles, of which there are three different sizes, are numerous, and do great injury to the flocks of the shepherds in the mountainous districts. There are various kinds of vultures, and also of the falcon tribe. There is the gentle falcon; the goshawk, a large grey short-winged bird; the shaukeen, which is taught to soar over the falconer's head, and strike the quarry as it rises; the chirk, which strikes the antelope, fastening on its head, and retarding its course till the hounds come up; with various other species.[5] Numerous other birds are common in India, such as herons, cranes; the gigantic stork, well known for clearing the country of snakes and other reptiles, and the populous cities of offal; the peacock, which is found wild in the forests in all its various and brilliant hues; the black-backed goose, measuring nearly three feet in length; besides other kinds, which migrate with the seasons, and are very destructive to the corn; swans, partridges, quails, gulls, plovers, wild ducks, and the other common domestic fowls.

Reptiles.

The serpent brood in India is numerous: they swarm in all the gardens, and intrude into the dwellings of the inhabitants. Some are comparatively harmless, but the bite of others is speedily fatal. The cobra di capello, the name given to it by the Portuguese, from the appearance of a hood which it produces from the expanded skin about the neck, is the most dreaded. It is not above three or four feet long, and about an inch and a quarter thick, with a small head, covered on the fore part with large smooth scales; it is of a pale-brown colour above, and the belly is of a bluish white tinged with pale brown or yellow. It is more frequently the assailant than any other, though the bite of these also is equally dangerous, and often fatal. The Russelian snake, about four feet in length, is of a pale-yellowish brown, beautifully variegated with large oval spots of deep brown, with a white edging. Its bite is extremely fatal. The whip snake is a remarkably malignant species; it darts from the thick foliage of the trees, at the cattle below, most commonly at their eyes, and inflicts wounds of which they quickly expire, often in great pain. Itinerant showmen carry about these serpents, and cause them to assume a dancing motion for the amusement of the spectators. They also give out that they render them harmless by the use of charms, though it is known that it is by extracting the venomous fangs. But, judging from the frequent accidents which occur, they often dispense with this precaution. The snake-catching fakirs pretend to bear a charmed life; and it is related, that one of these impostors being invited by a shopkeeper to catch a snake which had been seen in an inner apartment, was stung in the hip bone, and for shame would not discover the injury he had received, and went home endeavouring to counteract the poison, but in vain. He died; and such is the blind confidence of the natives in these impostors, that they believed he would revive into life, until the body became putrid.[6] Physicians differ respecting the mode in which the poison of serpents acts upon the human frame. The symptoms also vary, the patient being sometimes seized with torpor and insensibility, or falling into feverish heat and convulsions; the breathing laborious; the skin cold and clammy, with a livid countenance and a feeble pulse. The mode of treatment by the British physicians in India is to bind up the limb above the wound; along with this to apply strong stimulants, as ammonia, hartshorn, eau de luce, and the like; and, above all, to give the strongest narcotics, such as laudanum and brandy. By this judicious treatment many patients have been brought back from the jaws of death.[7] There are several water-snakes in India, the bite of which is venomous; and scorpions are common.

Fishes.

The rivers of Hindustan, and the surrounding seas, abound in a great variety of fishes and amphibious animals, such as alligators, porpoises, and small turtle of inferior quality. The voracious shark infests the mouths of the rivers, as well as the sea-coast, and grows to an enormous size. One that was caught in the Ganges measured in length eleven feet nine inches, and its girth round the shoulders was immense.[1] The dolphin of the Ganges is about seven feet long, and abounds chiefly in the delta of the river. It pursues its prey with great velocity, though at other times its motions are slow and heavy. The Ganges and its numerous branches, and all the tanks, swarm with fish; during the wet months they may be scooped up with a hand-net in every field; and, next to rice and plantains, they form the main food of the poorest classes. The bickty or cockup is an excellent fish; as is also the sable fish, which is uncommonly rich. But the best and highest-flavoured fish is the mango, a favourite delicacy at all the European tables, especially during the two months when it is in roe. Mullet abound in all the rivers, and are often killed with small shot as they swim against the stream. The Indian eel, of a pale-brown colour, with spots of a somewhat deeper hue, is said to possess a certain degree of electrical power. The remora, about seven feet in length, is remarkable for its singular habits. It is used by the fishermen for catching turtle. A long cord being inserted through a ring fastened to the tail of the fish, it is carried to sea in a vessel filled with salt water, and is let out into the water near the turtle, when it immediately fastens itself on its breast so firmly that both are drawn out together. There are many other kinds of fish, some of a delicate flavour, others noted for the various colours of their shining scales. The voracious dolphin, and the flying fish, its food, abound in the Indian Seas. The pomfret is much esteemed as a delicacy; also the robal, and several others of the same nature. The bumbalo, when dried, is an article of commerce, and is much prized for its nutritious qualities; as is also another fish, the urahl, found in the interior lakes. There are many other kinds of fish which we cannot attempt even to enumerate. The natives are dexterous fishers. They enclose the fish with nets into a narrow space, when they catch them with their hands or teeth. Bishop Heber, in his excellent Journal, gives a lively account of the fishing of a pool or lake which was nearly dried up owing to the want of rain. The fish were driven into a shallow part of the lake, when four Bheels from the mountains, with bows and arrows, made in a few hours such havoc among them, that they were procured in the greatest abundance. "They singled out the largest," says Bishop Heber, "and struck them with as much certainty as if they had been sheep in a fold. The arrows intended for striking the fish were so contrived that the iron head slipped off the shaft when the fish was struck, but remained connected with it by a long line, like a harpoon, and afloat on the water, which not only contributed to weary out the animal, but to show which way he fled, and to facilitate his capture."[2] Oysters are procured from the coast of Chittagong, not so large, but fully as well flavoured, as those of Europe.

Insects.

The insect tribes in India may be truly said to be innumerable; nor has any thing like a complete classification been given of them, in the most scientific treatises. The heat and the rains give incredible activity to innumerable noxious or troublesome insects, and to others of a more showy class, whose large wings surpass in brilliancy the most splendid colours of art. Stinging musquitoes are innumerable; and moths and ants of the most destructive kind, as well as others still more noxious and disagreeable. Amongst those which are useful is the silk worm; the insect which produces the vermilion dye, the cochineal, a South American species; and that which produces lac, which is imported into Europe and used for varnish, and more recently for cochineal. Clouds of locusts are occasionally seen, which leave no trace of green behind them, and give the country over which they pass the appearance of a desert. Dr Buchanan saw a mass of these insects in his journey from Madras to the Mysore territory, about three miles in length, like a long narrow red cloud near the horizon, and making a noise somewhat resembling that of a cataract. Their size was about that of a man's finger, and their colour reddish. They did no damage at that time to the smallest vegetable; but at other times they eat up every green thing.

Mineral productions, &c.

From the wild and inaccessible nature of the country in many parts of Hindustan, its metallic products are but imperfectly known. It is found to produce all the metallic ores, as well as diamonds and precious stones, and other mineral substances. Gold is generally found in the sands of the mountain streams, and is extracted by washing. The head streams of the Ganges bring along with them particles of gold, which in Rohilcund are collected by a particular caste of people. It is found in various parts of Mysore, particularly nine miles east of Boodicotta, where the country is impregnated with it; also in the Nielgherry Mountains, and in great quantities in all that tract of country that lies west, and in the adjoining Koondanad and Ghaut Mountains. This whole tract, including the mountains, and comprising a space of 2000 miles, contains gold. Unrefined gold is regularly exchanged by many of the mountain tribes of the north for the produce of the plains. It is estimated that about 1000 men are continually employed in collecting this precious metal. Copper is produced in the province of Delhi, which the natives collect either on the surface or with very slight excavations; also in the Rajpoot principality of Jeypoor in the province of Ajmeer, and in other parts of the same province, there are copper mines, and in the Carnatic, about forty miles north-east from Cuddapah. The metal is found in layers about two inches, and occasionally two feet thick; they are coated with ochre, and are in general flat, as if they had undergone compression. The ore exists in nearly a metallic state, without any admixture of sulphur, arsenic, or any other substance that requires separation. The best ores yield fifty, and the worst six per cent. of pure metal. The granitic mountains of Nepaul and Northern Hindustan contain much iron, lead, and copper, with a little gold in the river courses. The copper mines are quite superficial, the ore being dug from trenches entirely open above, so that the work is laid aside in the rainy season. Iron ore is found in many parts of Hindustan. There are mines of iron in Lahore and in Ajmeer. In Orissa many of the natives are iron smelters, and most of the iron sent from Balasore to Calcutta is produced in this district. In Bejapoor the working of iron furnishes employment to many of the inhabitants, who extract it by a very rude process. The Mysore country abounds in iron, and forges are erected, by which it is extracted from the black sand, which is found during the rainy season in the Cavery or its tributary streams, and partly from ores. At the iron works near Chinarayana Durga the ore yields about forty-seven per cent. of malleable iron, though, as usual, it is very impure. The smelting houses are so small and mean that they are put up in a day. There are also forges for manufacturing steel, which are minutely described by Dr Buchanan in his account of the Mysore country.[3] In Coimbetore and in Malabar the iron mines give employment to a considerable number of persons. The process and machinery for extracting the iron are very imperfect. Iron mines were formerly worked in the district of Boglipoor, but they have been long neglected. Rich iron ores are abundant in Cutch. The ore is gathered in baskets from the surface of the earth, and yields twenty-two per cent. of iron; and the steel which is made from this ore is the finest in the world. Lead is produced in various parts; also antimony, plumbago, sulphur, alum; and there are inexhaustible supplies of coal, though the mines are not worked with any effect. Coal is raised in Burdwan in considerable quantities and of a fine quality. Saltpetre is produced in Bengal and Bahar, though its manufacture does not go beyond the eastern limits of the latter province. It might, however, be attempted with success in Bengal, where the tendency of the soil to its production is very great; and there might be manufactories of salt in almost every part of the country, but they are restricted by the Company's monopoly. In the Mysore plains the wells are salt, and the ground is frequently covered with a saline efflorescence. A range of hills, extending from the Indus to the Hydaspes, yields the famous rock-salt of Lahore, of which they are almost entirely composed.[1] Many quarries are found in the hilly districts, which produce fine stone, that is cut by the inhabitants into pillars, flags, statues, and used for other ornamental purposes. Dr Buchanan saw several fine-grained specimens of granite, also a black stone used in the construction of Hyder's monument, and a beautiful green stone which takes on a marble polish. The hills of Guzerat contain marbles exhibiting many colours and qualities; and marbles are seen in the various tombs and monuments of ancient art still remaining in the country, finely ground and of different colours, white and yellow with red veins, and green clouded with yellow and black, of which the quarries have never been discovered.

Diamonds are no longer found in the celebrated mines of Golconda, but they are still gathered in the bed of the Krishna, and in the province of Gundwana. Near the confluence of the Hebe and the Mahanuddy, thirteen miles beyond the town of Sumbhulpoor, after the rains, the natives find diamonds in the red earth washed down from the mountains. The matrix containing them is a clay which has a red appearance like burnt bricks.[2] There are diamond mines in the south of India, about seven miles north-east of Cuddapah, on both banks of the Pennar river. These mines have been worked for several hundred years, and occasionally yield large diamonds, which are either found in the alluvial soil, or are recognised by their sparkling among the gravel after it is washed and spread out, or in rocks of the latest formation. The grounds are leased by the collector of taxes to private speculators, at a moderate rent. In Allahabad also, the table-land which surrounds Pannah, wherever the ground is of a gravelly nature, produces diamonds. The soil is from two to eight cubits deep, and diamonds are found intermixed with small pebbles, though not adhering to them. A very few diamonds in the course of a year repay the labours of the workmen. The diamonds found are mostly under the value of 500 rupees, or L.30, though some reach the value of from 500 to 1000 rupees. They are weighed and sold to the merchants residing at Pannah, and are by them carried to all parts of the country. The workmen are allowed three fourths, two thirds, or a half of the diamonds they find, according to their size, and any man is at liberty to dig. The number of workmen amount to 1000, who appear to be wretchedly poor. The diamond grounds are strictly guarded against the contraband trader, and the least delinquency draws down the prompt and barbarous vengeance of the rajah. These are supposed to be the diamond mines mentioned by Ptolemy. Their annual produce was estimated, in the reign of Acbar, at eight lacs of rupees. In 1750 it had fallen off to one half; and being now comparatively insignificant, it has been given up by the British to the native chiefs.

The other varieties of precious stones found in India are the ruby from the table-land of Mysore, the beryl, the topaz, the chrysolite, garnet, cat's eye, &c. There are cornelian mines in the province of Guzerat, in the wildest parts of the jungle. They consist of numerous shafts worked down perpendicularly, about four feet wide, and several of them to the depth of fifty feet. Some of them extend at the bottom in a horizontal direction, though not to any distance; the heavy rains cause the banks to fall in, so that new openings are always made at the end of the rainy season. The nodules weigh from a few ounces to two or even three pounds, and lie close to each other in abundance, not in distinct strata, but scattered about. They are of various colours when they are found, of a blackish olive, like common dark flints; others of a lighter hue, with a slight milky tinge; though it is quite uncertain what appearance they will assume after the process of turning. They are carried to Cambay, where they are cut, polished, and formed into the fine ornaments for which that city is so highly celebrated. Beautiful jaspers and agates are also found in this district, and in other parts of India.

Manufactures.

In every country the nature and quality of the manufactures must depend on the condition of the consumers, and amongst the despotic states of Asia these naturally consist of two classes; 1*st*, of the great and powerful, in whose hands the property of the country is accumulated, and who are comparatively few; and, 2*dly*, of the body or mass of the people, oppressed by extortion, and sunk in poverty. Such, accordingly, has been from time immemorial the state of Hindustan; and its manufactures, which are necessarily adapted to the use of these two classes, have always consisted of exquisitely fine fabrics of cotton, for the use of the imperial court, or of the rajahs and princes of the country, or of coarse stuffs for the common people; and to such perfection have they attained, that the modern art of Europe, with all the aid of its wonderful machinery, has never yet rivalled in beauty the products of the Indian loom. Yet the Hindu workman has no advantage from capital, from machinery, or from the division of labour; he prepares the raw material with his own skilful hand, in all the various stages of its manufacture; his loom and all his implements are of the rudest construction; and yet, by patience, perseverance, and unusual skill, he produces an article which is prized all over the world for its inimitable richness and beauty, as well as for its durability. The native artisan distinguishes at once these fine fabrics from all counterfeits, by the eye, the touch, and the smell. In the district of Dacca are chiefly fabricated plain muslins, variously denominated, according to the closeness or fineness of the texture; also flowered, striped, or chequered muslins, denominated from their patterns; and the thinnest sort of muslins, for the manufacture of which the province is much celebrated, as is Coromandel in Southern India for its calicoes and other piece-goods, of the most brilliant and durable colours. Other kinds more closely woven are fabricated in the western parts of Bengal; and another sort of a more rigid texture in every district. Coarse muslins, in the shape of turbans, handkerchiefs, &c. are made in all parts of Hindustan; and in its northern provinces plain and flowered muslins, but of inferior quality to the beautiful fabrics of Dacca. In Moultan are manufactured silks which possess a strength of texture and brilliancy of hue that have secured for them a preference in the Indian market. They are woven into shawls and scarfs, which are in great demand, and which the Indian manufacturer in other parts has never been able to rival, either in colour or durability. Carpets are also manufactured in this province, though they do not equal those of Persia. Various articles of calico are made, which still retain their Indian denominations, as khasahs, which are manufactured north and east of the Ganges; cloths of nearly the same quality are made near Tanda in Oude. Near Luckipoor, on the western frontier of Benares, in the neighbourhood of Allahabad, and also in the province of Bahar, baftaes are manufactured; sanaes in Orissa, and in the district of Midnapoor; and a similar cloth under the same denomination in the eastern parts of the province of Benares; woven silk and taffeta, both plain and flowered, in the neighbourhood of Moorshedabad; tissues, brocades, and ornamented gauzes, at Benares; plain gauzes for domestic use in the west and south of Bengal; and at Moulda, Boglipoor, and at several towns in the district of Burdwan, mixed goods of silk and cotton. Sackcloth is manufactured from packthread in many places, especially in the northern provinces, for the clothing of the mountaineers. Cotton is made into canvass in the neighbourhood of Chittagong, Patna, and other places; and blankets everywhere for common use. A coarse cotton cloth dyed red with cheap materials is very generally used, and is chiefly manufactured in the country between the Jumna and the Ganges. Fine and coarse calicoes are dyed with permanent and fugitive colours for common use in the province of Benares, the city of Patna, and the neighbourhood of Calcutta. This art appears to have had its origin in India, and to have been there perfected to a degree never surpassed by Europeans. Dimities of various kinds, and damask linen, are made at Dacca, Patna, Tanda, and various other places. In Mysore, near Bangalore, silk is manufactured into different articles of dress; into strong cloths, which men, women, or boys, wrap round them, and into turban pieces. These cloths are of a rich fabric, variously figured, and the pattern, if ordered, is elegantly wrought in gold thread. Turbans are made of cotton and silk. Thin white muslins with silk borders ornamented with gold and silver, and plain green muslins with silk borders, are manufactured for female dresses; also striped and chequered muslins; cloth like the khasahs of Bengal, for wrapping round the shoulders of men, sometimes with striped or silver borders. Handkerchiefs with red borders, a coarse thick white cotton cloth with red borders, and turbans ornamented with silver and gold thread at the ends, are also made in this district; and the dyeing of cotton cloth, cotton thread, and silk, is carried on by a set of people who act as tailors, cloth-printers, and dyers. Tanneries are established, and manufactories of oil.[1] At Chinapatam there are manufactories of glass, of green and of glass rings, universally worn as bracelets by the women of the Deccan. Steel wire is also made here for the strings of musical instruments. At Vizigapatam, in the Northern Circars, the inhabitants are very expert in carving curious little boxes of ivory and bone. Throughout Southern India manufactories of cotton and silk are generally established. In the Northern Circars the principal part of the East India Company's investment of piece goods was formerly provided. This country, extending about 500 miles along the coast of Coromandel, from the river Kistnah to the borders of Cuttack, has from very early times been the seat of an important and extensive manufacture of cotton piece-goods, of which the description of calicoes known as Madras long cloths and salempores are the chief, and, with Masulipatam dyed handkerchiefs, and other kinds of goods for the African and West India trade, have, until lately, been in great demand. Masulipatam goods have, however, for some years been entirely superseded by the manufactures of Manchester and Glasgow; and in all appearance the Northern Circars will at no distant period of time be deprived of the manufactures of white calicoes also.[2] A great change has indeed been brought about in the manufactures of India by the introduction of British goods, which, in many branches, have supplanted those of the country; the poor Hindu, notwithstanding the low rate at which he works, is thus undersold in his own market by the manufacturers of Manchester and Glasgow; and this competition of British goods nearly ruined the native manufacturers of India, deprived the workmen of employment, and reduced them to great distress; so that the directors remark concerning the Indian trade, that "it exhibits the picture of a commercial revolution, productive of much present suffering to numerous classes in India, and hardly to be paralleled in the history of commerce."

Commer

Hindustan, from its great extent, and the diversity of its soil and climate, supplies the materials of an extensive commerce. Its internal trade is great, while its rare and precious products are exported to the remotest regions of the world. An extensive commerce takes place between Bengal and the other maritime districts, and the western provinces of Hindustan, consisting in the exportation of grain from the corn districts, in exchange for salt, a great staple, for betel nut, sugar, raw silk, silk and piece goods. From the provinces of Central India are imported into Bengal opium, the great staple of Bahar and Malwah, saltpetre, indigo, cotton, cotton cloths, &c.; and from Allahabad diamonds, in return for which salt is received, and European goods, from the maritime parts of Bengal. The holy city of Benares is a great mart of trade, in which are exchanged the shawls of the north for the diamonds of the south, and for the muslins of Dacca and the eastern provinces; and it has, besides, very considerable silk, cotton, and fine woollen manufactures of its own, the produce of which is exchanged for other commodities. Through the northern provinces of Delhi and Lahore a great trade is carried on between the hill countries and the plains. The inconsiderable town of Hurdwar or Hardiwara, being a celebrated place of Hindu pilgrimage, is a great commercial emporium, to which multitudes resort for the purposes of trade, as well as from piety. This great annual concourse takes place in the spring, when the produce of the northern and western countries is exchanged for the manufactures of the lower provinces. The principal articles brought here for sale from Cabul, Candahar, Moultan, and the Punjab, are horses, mules, camels; some of these from Balk, Bokhara, and the countries on the northern side of the Hindu Coosh Mountains; a particular species of tobacco, antimony, assafœtida, dried fruits, such as apricots, figs, prunes, raisins, almonds, pistachio nuts, and pomegranates; from Cashmere and Amritsir, shawls, dootas, and pattoos; spotted turbans, looking-glasses, toys, with various manufactures in brass and ivory from Jeypoor; shields from Rohilcund, Lucknow, and Silhet; bows and arrows from Moultan and the Doab; rock-salt from Lahore; baftas and piece-goods from Rahn, a large city in the Punjab. The country of Marwar also supplies many camels, and a species of flannel called loo. In exchange are brought from the British provinces Kharwa muslins, mushroo or sarsnet, woollen cloths, the coarsest of which only find a market. In this fair Dutch and Venetian coins are current; and some toys of European manufacture were seen exposed to sale by Mr Webb. The northern merchants by whom it is frequented assemble at Amritsir in caravans about the end of February, and pursue their route through the Sikk country, molested by freebooters, who frequently carry off stragglers. Still farther to the north and west the province of Lahore and Moultan export to the countries to the west of the Indus, sugar, rice, indigo, wheat, and white cotton cloths, hides, &c. The imports are swords, horses, fruit, lead, and spices; and into all these countries European goods are imported from the lower provinces. The southern provinces export to Bengal pepper, betel nut, sandal wood, and cardamums, teak timber, &c.; whilst they receive in return salt and rice, cotton cloths, and articles of European manufacture.

---

[1] Buchanan's *Journey through Mysore*, vol. i. 209, 229.

[2] See Copy of a Letter from the Secretary to the Court of Directors, to the Secretary of the India Board, dated East India House, 5th September 1828.

A very considerable coasting trade is carried on between the different parts of Hindustan. Bengal exports to Madras and the coast of Coromandel grains of different descriptions, sugar, saltpetre, molasses, ginger, long pepper, oil, silk wrought and unwrought, muslins, spirits, and provisions. The returns are salt, red wood, fine long cloth, izarees, and chintzes. From the Malabar coast the imports are sandal wood, coir rope, pepper, cardamums; and the returns are generally in the annual supplies which Bombay receives from Bengal. From Bombay are brought teak timber, elephants' teeth, lac, &c.

From the reputed wealth and precious produce of India, foreign nations were always desirous to participate in its trade. Prior to Alexander's expedition to the East it was scarcely known to the Greeks, nor is it certain that they had ever seen its productions. But we know that these were brought to Rome, especially silk, which so allured the vanity of the Roman ladies that it sold for its weight in gold. Other valuable commodities of India, such as calicoes, muslins, aromatics, ivory, diamonds, pearls, and other gems, precious aromatics, the pepper of Malabar, turtle shell, &c. and some dry sugar and indigo, were also imported into Alexandria, the chief emporium of eastern commerce, and were naturally attracted to the great metropolis of the ancient world. This trade was carried on from Myos Hormos, the chief port on the Red Sea, whence, after the conquest of Egypt by the Romans, the annual fleets, sometimes of 120 vessels, set sail, and, under the propitious influence of the south-west monsoon, boldly stretched across the Indian Ocean for the western coast of Hindustan, which they reached in about forty days; and afterwards extended their voyage round Cape Comorin to the coast of Coromandel and the mouths of the Ganges. The high price received for these eastern luxuries in Rome encouraged the merchants to provide larger vessels, and a band of archers to defend them against the pirates, who then, and until very lately that they were extirpated by British ships of war, infested the western shores of India. The commodities of the East being landed at Myos Hormos, were carried on canals to Coptos, the seat of a flourishing trade, and thence by sea to the Nile, whence they reached Alexandria by water carriage, and were reshipped to the different ports on the Mediterranean. The produce of India was also brought to Europe by other routes, namely, by the way of Palmyra, then a flourishing city, and thence to Rome and other western countries, through the ports of Syria; or across the Himalaya Mountains to the Oxus, thence to the Caspian, and afterwards to the Black Sea, and finally to its ulterior markets in Europe. But though there was a demand in Europe for the produce of India, there was no demand in India for the produce of Europe; and bullion was the only article that could be sent out in exchange. The annual drain of gold from Rome and its provinces, for Indian goods, was estimated by Pliny at 500 sestertia, equal to about L.400,000. In the convulsions which followed the decline of the Roman empire, the trade of the East was successively engrossed by the Persians and Arabians. The latter in the year 636 built the city of Bassora, which soon grew into a great commercial mart; and to this place, and to Ormus, long celebrated for its vast riches and its trade, the spiceries and merchandise of India were brought, and distributed through the various ports of the Mediterranean. After the expulsion of the crusaders from Syria and Egypt, Alexandria again became the chief entrepôt of eastern produce, whence it was carried to Italy by the Venetians and others, and distributed throughout Europe. But the discovery of a passage to India in 1495 by the Cape of Good Hope changed the course of this trade, which now entirely left the Italians, and was engrossed by the Portuguese for nearly a century without any molestation from European rivals. At length the Dutch and the English became their competitors, and established joint-stock companies, with the exclusive privilege of the eastern trade. But their anticipations of profit were not realised. The great distance of Europe from India, and the want of an equivalent for its produce, precluded any extensive intercourse; the trade accordingly bore a very small proportion to the trade of the country; and being besides cramped by monopolies, it never attained its natural growth. In 1773 the average exports of Britain to India amounted to about L.489,000 a year; in 1793, on a like average, to about a million a year; and it does not appear that a greater trade was carried on with India from any other part of Europe. The commerce of nations is limited to the surplus produce which they can mutually exchange; and, from the great distance between India and Europe, this surplus produce was long confined to those few articles which, containing a great value in small bulk, could bear the expense of a long voyage. The demand was also altogether on the side of Europe, and its trade with India consisted merely in the purchase, with bullion, of a small quantity of precious articles for the consumption of the rich. The progressive improvement of industry in Europe, together with the partial opening of the trade to India in 1793, and still more in 1814, has occasioned not only a greater exportation of British goods, but a change also in the nature of the trade. It is not so much the produce of the labour, as of the climate and soil of India, which no ingenuity can supply, that is in demand in Britain; and accordingly whilst the import of Indian manufactures has fallen off, that of the raw material, and many varieties of vegetable produce, has increased. Thus the importation of cotton piece-goods, namely, white calicoes and muslins, which amounted in 1814 to 1,266,608 pieces, had decreased in 1832 to 407,506 pieces; whilst within the same period the importation of cotton wool had increased from 2,850,318 lbs. to 35,219,504 lbs., and the exportation of cotton manufactures from 811,003 to 57,183,599 yards. Even the fine muslins of Dacca are in less demand since the introduction of British goods.[1] Thus, in the progress of the trade between India and Europe, the former country, notwithstanding its boasted wealth and superior industry, has taken the lowest place, exporting her rude produce for the manufactures of the richer country, which is the nature of the trade carried on between Britain and America, and the countries in the north of Europe, and is a sure index to the respective progress of the two countries in wealth and improvement. Those countries which cannot manufacture their own rude produce send it to Britain, which abounds in capital, and still more in art and industry; and both countries are benefited, the poorer country exchanging its surplus produce for a supply of manufactures of which it is in want, and the richer country the produce of its overflowing capital, for a supply of the raw material, which its own soil does not afford. This is now the relative condition of Great Britain and India. The former having outstripped the latter country in industry and wealth, sends out a supply of cheaper goods than the native workman can furnish; and so prodigious have been the improvements in machinery, that the raw material of cotton is imported from India, and being manufactured in Britain, is re-exported and sold at a cheaper rate than it can be made at home, though loaded with the expense of a double voyage across half the globe; and thus it has become an important staple in the trade of Great Britain with the East. A notion was long and successfully propagated by the advocates of the monopoly, that the Hindus, from their poverty and their simple habits, would never become extensive consumers of European goods, and that the demand was amply supplied by the exports of the East India Company. Evidence to this effect was given before the committee of the House of Commons in 1810, by Sir Thomas Munro, and other eminent servants of the Company. But such statements have been completely refuted by the rapidly increasing exportation of British goods to India since the partial opening of the trade in 1814. This will appear from the following table.

1831	146,480	3,488,571	3,635,051
1832	149,193	3,601,093	3,750,286

The goods exported, as they are enumerated by Mr Rickards in his valuable work on India, consist of all the staple manufactures of Britain. "Woollens and cottons," he mentions, "of every variety and value; manufactured silks; hardware of all descriptions; iron, copper, lead, tin, and spelta, in large quantities; marine and military stores; machinery for various uses; glass ware of the metal specimens, down to articles of the commonest use; china ware or porcelain, the same; jewellery of all sorts; gold and silver plate and ornaments; clocks, watches, furniture, carriages, harness, haberdashery, hosiery, stationery, books; in short, every article of luxury, comfort, or convenience, which British industry can produce."[1] According also to all the most correct observers of Indian manners, the taste for European fashions, luxuries, and comforts is rapidly extending among the Hindus. Bishop Heber, in his interesting journal of a tour through India, strongly confirms this fact. "The wealthy natives," he observes, "now all affect to have their houses decorated with Corinthian pillars, and filled with English furniture; they drive the best horses and the most dashing carriages in Calcutta. Many of them speak English fluently, and are tolerably read in English literature; and the children of one of our friends I saw one day dressed in jackets and trowsers, with round hats, shoes, and stockings."[2] At Benares he found "English hardware, swords, shields, and spears, from Lucknow and Monghyr; and these European luxuries and elegancies, which are daily becoming more popular in India, circulate from hence through Bundelcund, Gorruckpoor, Nepaul, and other tracks which are removed from the main artery of the Ganges."[3] At Nusseerabad, in the province of Berar, the same traveller mentions that "English cotton cloths, both white and printed, are to be met with commonly in wear among the people of the country, and may, I learned to my surprise, be bought best and cheapest, as well as all kinds of hardware, crockery, writing desks, &c. at Pallee, a large town and celebrated mart in Marwar, on the edge of the desert, several days' journey west of Joudpoor, where, till very lately, no European was ever known to have penetrated."[4] In short, it appears that British and other European manufactures, from their quality and cheapness, are everywhere in demand. They penetrate into the remotest districts of Asia; and now that the termination of the East India Company's monopoly, which took place in 1834, has laid open Hindustan to the capital and enterprise of Britain, experience proves that an equal demand for them may be anticipated in that country. We subjoin the following tables, containing a view of the trade between Great Britain and Hindustan, and a list of the principal articles exchanged between the two countries, abridged from the parliamentary accounts.

Besides the articles here enumerated, Great Britain exports other varieties of European goods, such as books, carriages, guns, pistols, haberdashery, hardwares and cutlery, machinery, musical instruments, &c.

---

[1] When the declared value of the articles exported by the East India Company amounts only to L.300 or L.400, or less than that sum, as in the case of cotton manufactures, &c. it is not particularly specified.

The pernicious effects of monopoly are illustrated by the whole history of the Indian trade. It appears, from the account of the exports and imports, how the commerce of the two countries expanded, as with an elastic bound, when this dead weight was partially removed in 1810. The wall of separation has now been entirely thrown down. By the late great and enlightened measure of Mr Grant, a free trade is established to India, and a free intercourse with the natives; and from this liberal policy we may anticipate a still greater extension of the trade. But there are other barriers yet to be removed. Although British goods may be introduced into the markets of India, certain staple articles of that country are excluded from Britain by heavy and unequal duties; and this for the purpose of favouring the trade of the West Indies. Thus sugar, which might be cultivated to any extent in India, pays a duty of thirty-two shillings per cwt. in place of twenty-four shillings, the duty levied on West India sugar; and this, with the heavier charge of freight and insurance, is a serious bar to its importation into Britain. Accordingly, while only 700,000 cwts. of sugar are annually imported from India, the annual importation of the West Indies amounts to between 4,700,000 and 4,800,000 cwts. In like manner, coffee, which has only been of late cultivated in India, though it might be produced to any extent, pays a duty of ninepence per pound, in place of sixpence, the duty on West India coffee; and the tobacco of India pays threepence more of duty, namely, three shillings per pound, on being imported into Great Britain, than the tobacco of Mauritius, or of any other British colony. No reason can be assigned for this unjust distinction. The mother country ought to dispense equal justice to all. If the West Indian colonies have been of late depressed by the low price of sugar, the native manufactures of India have been nearly ruined by the competition of British goods, and justice as well as policy imperiously demands for the produce of Hindustan a free access to the markets of this country.

The following tables contain a general view, 1*st*, of the extent and value of the trade of India to all parts of the world; and, 2*dly*, of the extent of its trade to the different countries of Europe and Asia, with the exception of that to China, of which a more detailed account will be given.

An extensive commerce is carried on between Hindustan and China, and one of the great staples in this trade is opium, which being a contraband article, is smuggled into China in great quantities by private traders from Hindustan. This trade is either carried on in armed boats, in defiance of the Chinese authorities, or they are paid largely for their connivance. We subjoin the following account of the trade between Hindustan and China.

Account of the Trade carried on with China by the East India Company, or in their Ships by their permission.

An accurate census of the population is still a desideratum in the statistics of Hindustan. Partial estimates have indeed been made in different districts, by the industry of British judges and magistrates; but these do not agree with subsequent and more accurate inquiries. In 1801, returns were made at the desire of the supreme government, of the population of several districts in Bengal, by the magistrates and collectors, which are generally believed greatly to underrate the population. In 1808, Dr Buchanan, by the direction of government, framed, from the most careful inquiries, an accurate census of certain districts of Bengal, which created astonishment, as his estimate was more than three times that of the collector, and more than double that of the magistrate. It was confirmed, however, by the careful investigations of Mr Bayley in 1814, and is now generally relied on for its accuracy. An estimate has been published by authority, of the number of the villages and houses in Lower Bengal; from which, reckoning five inmates to a house, the population has been computed at 37,238,265 souls. Other computations, made on different data, produce nearly the same result. From an accurate survey of one district, the inhabitants on each square mile were found to amount to 2003; and this principle of computation being generally applied to Bengal, will give a population of 33,590,770. But it is only in particular provinces that there is even this approximation to accuracy. In the remote districts and provinces we have no data for a confident estimate; and there is no general census of Hindustan which rests on any higher authority than plausible conjecture, and which may not be erroneous by many millions. We subjoin the following population table, which seems to be as accurate as any that has yet been constructed.[1]

---

[1] Notwithstanding the ravages committed by incessant wars and revolutions, as well as by famine and pestilence, their usual concomitants, India has, from the earliest times, been a densely-peopled country. In different states of society, the law of the increase of mankind will vary according to their relative circumstances and position, and the same or nearly the same principle will be found to apply to those classes who are placed at the opposite extremities of the scale. Amongst a people who are possessed of affluence, or the means of commanding the necessaries and comforts of life, the exercise of moral restraint is unnecessary; amongst those who are reduced to a mere physical subsistence, without the possibility, and consequently without the desire, of improving their condition, it will be disregarded; and hence the same results will follow from causes in their own nature diametrically opposite. But in India the great mass of the population have for ages been placed in a situation which excludes all idea of improvement; and religion has lent its powerful aid to obstruct the operation of those natural causes which, in other countries, have served to ameliorate the condition of the people. Confined to the use of vegetable food, inhabiting a country the nature of whose climate renders the greatest simplicity of attire and of household accommodation sufficient for all purposes absolutely necessary to mere existence, and prevented by the law of caste from ever passing beyond the condition in which the accident of birth may have placed them, the natives of India, habituated to a minimum of the simplest fare, or what in other countries would be considered as a famine allowance, have, in spite of all the grinding exactions of despotism, and the devastations of war, conquest, and anarchy, continued to increase and multiply, and, at every period of their history, the population has been found to press harder than in any other part of the world upon the means of subsistence. Amongst a people so circumstanced, with a religion which tends at once to inflame the animal passions, and to debase the understanding, it would therefore be vain to expect that those moral considerations which operate as a restraint amongst other communities of mankind, should have any effect whatever in controlling the impulses of nature, or checking that tendency to excess, which has originated the most difficult problem connected with the science of government. Of all productions, that of human beings is the least susceptible of regulation; and as it is frequently found to advance most steadily in countries where poverty and misery have reached the extreme point of depression, and become almost universal, the only checks which can prove even temporarily effective, are those great and wide-spreading desolations to which we have alluded, combined with that permanent disregard of life which is found to prevail wherever mankind generally are reduced to the condition of the Hindus, and which, amongst the latter, is fostered by the barbarous rites of a cruel and sanguinary superstition. But it may be permitted to hope, that though India always has been, it will not always be, what it now is; that the extension of commerce, under the protection of a vigorous and impartial government, will awaken new ideas in the minds of the people; that security to person and property will give a strong stimulus to industry; that the habitual contact with a higher and more rational form of civilization will serve to mitigate their prejudices, and, in time, to destroy the influence of a debasing superstition; and that, in proportion as their wants are multiplied, their efforts to ameliorate their condition will be increased.

Relative Area and Population of the Modern States of Hindustan for A. D. 1820.

	British Square Miles.	Population.
Bengal, Bahar, and Benares	162,000	39,000,000
Additions in Hindustan since A. D. 1765	148,000	18,000,000
Gurwal, Kumaon, and the track between the Sutledge and Jumna	18,000	500,000
Under the Bengal presidency	328,000	57,500,000
Under the Madras presidency	154,000	15,000,000
Under the Bombay presidency	11,000	2,500,000
Territories in the Deccan, &c. acquired since 1815, and not yet attached to any presidency	60,000	8,000,000
Total under the British government	553,000	83,000,000
British Allies and Tributaries.		
The Nizam	96,000	10,000,000
The Nagpoor rajah	70,000	3,000,000
The king of Oude	20,000	3,000,000
The Guicowar	18,000	2,000,000
Kotah 6500, Boondee 2500, Bopaul 5000	14,000	1,500,000
The Mysore rajah	27,000	3,000,000
The Satarah rajah	14,000	1,500,000
Travancore 6000, Cochin 2000	8,000	1,000,000
Under the rajahs of Joudpoor, Jeypoor, Odeypoor, Bicanere, Jesselmere, and other Rajpoot chiefs; Holcar, Ameer Khan, the Row of Cutch, and innumerable other petty native chiefs; Sikhs, Gonds, Bheels, Coolies, and Catties, all comprehended within the line of British protection	283,000	15,000,000
Total British and their allies	1,103,000	123,000,000
Independent States.		
The Nepaul rajah	53,000	2,000,000
The Lahore rajah (Runjeet Singh)	50,000	3,000,000
The Ameers of Scinde	24,000	1,000,000
The dominions of Scindia	40,000	4,000,000
The Cabul sovereign	10,000	1,000,000
Grand total of Hindustan	1,280,000	134,000,000

Other calculations, on data sufficiently plausible, swell the population under the dominion of the British, including the allied and protected states, to 200,000,000. There is of course considerable uncertainty in all these accounts.

Races.

A country of such vast extent, under one common appellation, and subdivided by many impassable tracts of mountain and jungle, comprises, as may readily be imagined, numerous races, differing in their origin, in their physical aspect and frame, in their manners, customs, in their respective advances in civilization and pursuits, as well as in their modes of faith and language; and accordingly Bishop Heber, who excels all other writers in the delineation of Indian manners, observes, that "it is a great mistake to suppose that all India is peopled by a single race, or that there is not as great a disparity between the inhabitants of Guzerat, Bengal, the Doab, and the Deccan, both in language, manners, and physiognomy, as between any four nations of Europe;" and in another passage he says, "the inhabitants of the presidencies of Madras and Bombay, and of the Deccan, are as different from the nations I have seen, and from each other, as the French and Portuguese from the Greeks, Germans, and Poles."[1] A minute account of the various races and castes, with the still more various subdivisions into which the inhabitants of Hindustan are distinguished, would fill a volume, and would besides be exceedingly tedious. A general description, however, of the most remarkable tribes which compose the mixed population of this extensive country, forms an essential part of its history. The great division of the people is into Hindus and Mahommedans, in the proportion of about seven to one. And these two great classes are distinguished not more by their religion than by their peculiar disposition and character. The Hindu is careful, penurious, and abstemious in his habits; timid, obsequious, and fawning in his manners; chiefly attaining his ends by deceit and cunning, the usual resource of weakness; whilst the Mussulman still retains the haughty and irascible character of a conqueror, and his hostility to the English, which he is at no pains to conceal, like the Hindu, by an obsequious demeanour. He is withal prodigal, luxurious, fond of ease and pleasure, and dissolute to excess in his morals; more courageous and martial, however, with more energy of purpose and elevation of sentiment, and more cultivated, than the Hindu of Bengal. In the population of Bengal these two races may easily be distinguished from each other; and amongst the Mahommedans, the Mogul, the Afghan, and their immediate descendants, may be known amongst the native Mussulmans. The features of the Bengalee distinguish him from the other inhabitants of Hindustan. He is stigmatised as of a cowardly disposition, and, from whatever cause, is not esteemed throughout the country. With these two principal classes are intermingled, in very small proportions, British, Armenians, a peaceable race, and highly honourable in their dealings, Portuguese, and other Christians. The Parsees are numerous in the island of Bombay, where they amount to 10,738; they are descendants of the Guebres or fire-worshippers, are a fine race, being generally engaged in traffic, and distinguished in their dealings by the highest integrity and intelligence. The Jews are numerous in India, and many are to be found in the Bombay army, where they have often behaved bravely. The Asiatic Jews are distinguished by a large Roman nose. The Mahrattas, a powerful tribe, have been long distinguished in the wars and politics of India. They are chiefly found in the Deccan, which contains about 3,285,985 inhabitants, of whom they compose about three fifths. They were originally a pastoral and warlike people from the mountains of Berar, who with a host of cavalry invaded and desolated the adjacent provinces with fire and sword, and at length acquired an extensive empire. Minute shades of difference prevail amongst them, but no distinctions of caste; every Mahratta eating with his neighbour, unless, which often happens, he be expelled from his caste. They are not a military caste, as appears from the names of farmer, shepherd, and cowherd, by which their principal tribes are known; and also from their exterior, which marks an origin different from that of the military Rajpoot. They are of a diminutive size, generally badly made, and of a mean look and rapacious disposition; whilst the Rajpoot has both personal grace and dignity. The memorable battle of Paniput, fought in 1761, gave a blow to the Mahratta power, from which it never recovered; and the confederacy was entirely dissolved in 1817, when the peshwa, the great feudal chief of the empire, surrendered to the British, and was by them confined as a state prisoner. The nation derives its name from Mahrat, a province of the Deccan; though it is the opinion of some that the Mahrattas migrated from Persia about 1200 years ago.[1] The Mahratta language is widely spread over India. It is remarkable, that in proceeding northward into Northern and Central India, and into the Rajpoot states, the people far excel in strength and stature the feeble Hindu of the southern provinces, being fully equal in their bodily frame to Europeans. "They despise," says Bishop Heber, "rice and rice eaters, feeding on wheat and barley bread, exhibiting in their appearance, conversation, and habits of life, a grave, proud, and decidedly a martial character, accustomed universally to the use of arms and athletic exercises from their cradles, and preferring very greatly military service to any other means of livelihood." The character of the Rajpoots, the Sikhs, and the Jauts, fully answers to this animated description of a warlike race. The tribe of Jauts or Jats was little known in India till about the year 1700, when they migrated from the banks of the Indus, and became industrious cultivators in the Doab, or the country between the Ganges and the Jumna. During the civil wars which ensued on the death of Aurungzebe, they acquired a large extent of territory, in which they built forts, and accumulated wealth. They were noted plunderers; and it was out of the spoil taken from Aurungzebe's army in its retreat from the Deccan that the fortress of Bhurtpore was erected, in the gallant defence of which against the British they fully sustained the character of brave soldiers. Their claim to the distinction of a military caste has, however, been disputed; and it is said, that though success has emboldened them to assume that honourable title (*khetri*), they were originally a low tribe of sudras or labourers. They also affix to their name *singh*, a lion, which probably belongs only to the Rajpoots. The Jauts are said by Bishop Heber to be the finest people in bodily advantages and in martial spirit which he had seen in India, and their country one of the most fertile and best cultivated. They have a high character for valour throughout Hindustan; insomuch, adds the writer above quoted, "that when I was passing through Malwah, 'gallantee shows,' like those carried about by the Savoyards, were exhibited at the fairs and in the towns of that wild district, which displayed, amongst other patriotic and popular scenes, the red coats driven back in dismay from the ramparts, and the victorious Jauts pursuing them sabre in hand."[2] The lower classes of Jauts found in the barren tracts of Ajmere, and in Northern India, are however differently described, being of small stature, ill-looking, and black in complexion, and their condition that of squalid poverty. The Sikhs were originally a religious sect, of which the founder, Nanak, was born A. D. 1419, in the province of Lahore; and the word Seik, properly Sikh or Siksha, in the old Sanscrit, signifies a disciple or devoted follower. He left two sons, from whom are descended 1400 families, called Shahzadehs, who live at Dera, in the Punjab, highly respected. His successors were spiritual chiefs, until the year 1675, when Gooroo Govind, a warrior, succeeded. He converted the Sikhs from religious sectaries into ferocious soldiers; he changed their name from Sikh to Singh, signifying a lion, the title claimed and highly prized by the Rajpoots; and enjoined his followers to cut off their hair, or to shave their beards. The tribe consider this chief to be the founder of their political independence, and Nanak of their religion. The Sikhs acquired power during the convulsions that followed the death of Aurungzebe, and after the invasion of Nadir Shah. They were severely checked by the Mahommedans, and were nearly exterminated by the victorious Afghans after the battle of Paniput in 1761. But their valour still triumphed in the struggle, until they acquired and consolidated their present possessions under Runjeet Singh, who has reduced under his own powerful sway all the petty principalities in the country. The eagle eye, Roman nose, and flowing beard, of the Sikh cavaliers, give them a noble appearance; and in horsemanship they are not excelled by any other nation either of Europe or Asia. Colonel Todd, in his great work on Rajast'han, describes the appearance of the Rajpoot cultivators in the valley of Odeypoor, who came to meet him in a body, "as being so striking as to draw forth the spontaneous exclamation from his friend, 'what noble looking fellows!" "Their tall and robust figures," he adds, "sharp aquiline features, and flowing beards, with a native dignity of demeanour, though, excepting their chiefs, who wore turbans and scarfs, they were in their usual labouring dresses, immense loose breeches, and turbans, compelled admiration and respect."[3] Their cast of countenance is Hindu, somewhat altered by their long beards; they are active, and more robust than the Mahrattas, owing to better living and a healthier climate; and rival in courage the most renowned tribes of India. They evince in battle the most determined contempt of personal danger, and are easily roused to desperation by prejudice or religion; they act as infantry in foreign armies, and as cavalry at home. Their address is bold and somewhat rough; they speak invariably in a loud bawling tone of voice; and are dissolute in their habits, indulging so freely in spirituous liquors, which their religion allows, though tobacco is prohibited, and in opium and bang, an intoxicating drug, that a Sikh soldier is rarely sober after sunset. The Sikhs are allowed to eat the flesh of all animals except the cow. They are strict in their religious observances; and converts, whether Hindu or Mahommedan, must give up all customs which infringe the tenets of Nanak, or the military institutes of Gooroo Govind. The military class highly relish the flesh of the jungle hog, of which they compel Mahommedan converts to partake, and also to abstain from circumcision. The Sikh merchant or cultivator, if he be a Singh, is still a soldier in his habits, as he wears arms, and is well trained from his infancy to the use of them. The original followers of Nanak, the Kalasa Sikhs, differ widely from the warrior tribe. They are as pliant, versatile, and insinuating in their manners as the lower class of Hindus, whom they so much resemble in their dress and appearance as not to be readily distinguished. The descendants of Nanak are a mild, inoffensive race; and the other religious tribes retain their peculiar manners.

The Rajpoots inhabit the Rajpoot states of Mewar or Odeypoor, Marwar or Joudpoor, Bicanere and Kishenagur, Kotah, Boondi, Amber or Jeepoor, Jesselmere, and the Indian desert to the valley of the Indus. They are the children of the sun and the moon; and, in memory of their great ancestor the radiant Surya, or Apollo, many of them wear badges of gilt metal round their necks with the image of a sun and moon on horseback. The lineage of both the solar (Soorya) and lunar (Indu) tribes is given by Colonel Todd, on the authority of the Puranas (sacred books), a copy of which, obtained from the library of the Rana of Odeypoor, he carefully consulted, in the presence of a body of learned pundits. This work contains the valuable results of his learned researches into the antiquities and history of the Rajpoot tribes, which were conducted with all the patience and perseverance that an enthusiastic devotion to the subject can alone inspire; and being guided by philosophy, and the most profound knowledge of oriental literature, have thrown great light on the history and character of the ancient inhabitants of Rajpootana. Vyasu, the Hindu historian, gives fifty-seven princes of the solar line from Menu to Rama; and fifty-eight from the same period of the lunar race, from Buddha, its founder, to Krishna. The establishment of these two grand races in India is fixed by Colonel Todd at about 2256 years before the Christian era. From Rama all the tribes termed Sooryavansa or Race of the Sun, claim their descent, namely, the present princes of Mewar, Jeepoor, Marwar, Bicanere, and their numerous clans; whilst from those of Buddha and Krishna the families of Jesselmere and Cutch, extending over the Indian desert, from the Sutledge to the ocean, deduce their pedigrees. Colonel Todd draws a parallel between them and the ancient Scandinavians and Scythians; and the striking resemblance that appears in the manners, customs, and religious opinions of the two nations, he insists, strongly suggests the idea of a common origin. These ancient tribes were devoted to the god of war; and the Rajpoot, he observes, "delights in blood; his offerings to the god of battles are sanguinary, blood and wine. The cup of libation is the human skull. He loves them because they are emblematic of the deity he worships; and he is taught to believe that Hor loves them, who in war is represented with the skull to drink the foeman's blood, and in peace is the patron of wine and women. With Parbutti on his knee, his eyes rolling from the juice of the p'foot and opium, such is this Bacchanalian divinity of war." "Is this Hinduism," he adds, "acquired in the burning plains of India? Is it not rather a perfect picture of the Scandinavian heroes."[1] This hypothesis of a common origin Colonel Todd further supports from the Rajpoots slaying the buffalo, hunting the boar and the deer, shooting ducks and wild fowl; from their ancient use of the war-chariot, as appears from the inscriptions and engravings on their monuments; from the order of the birds common amongst them; from their passion for gaming and intoxicating liquors; from their sensual and slothful habits; from their funeral ceremonies, particularly from their immolation of females; and from other peculiarities of manners and customs common to these ancient tribes. The Rajpoots claiming so splendid a descent are distinguished above all other tribes by rank and pride of birth, and high aristocratic feeling; and hence has arisen the barbarous custom among the chiefs of putting to death their female children as soon as they are born, lest they should contract any base alliance. Others say that this custom is occasioned by the practice amongst the Rajpoot princes of providing splendid dowries for their daughters, by which they are frequently impoverished, and to avoid which they murder them in infancy. Colonel Todd, the depth of whose researches into the ancient literature of the Hindus appears in his accurate and lively delineation of the national character and manners of the Rajpoots, ascribes to their chiefs a more ancient and chivalrous descent than many of the royal houses of Europe. "From the most remote periods," he observes, "we can trace nothing ignoble, nor any vestige of vassal origin. Reduced in power, circumscribed in territory, compelled to yield much of their splendour and many of the dignities of birth, they have not abandoned an iota of the pride and high bearing arising from a knowledge of their illustrious and regal descent. The poorest Rajpoot of this day," he adds, "retains all the pride of ancestry, often his sole inheritance; he scorns to hold the plough, or to use his lance but on horseback. In these aristocratic ideas he is supported by his reception among his superiors, and the respect paid to him by his inferiors." These honours and gradations of rank are supported by peculiar privileges, each of the superior orders being entitled to a banner, to kettle-drums, preceded by heralds, and silver maces, with peculiar gifts and personal honours in commemoration of some exploit of their ancestors. Armorial bearings are used by the martial Rajpoots; a golden sun on a crimson field adorns the great banner of Mewar; those of the chiefs bear a dagger, whilst others display a fine coloured flag; and the lion rampant in an argent field was the warlike emblem of the now extinct state of Chanderi.[2] The Rajpoots are divided into thirty-six royal races, described by Colonel Todd; to each is attached a bard, who is acquainted with all the peculiarities, religious tenets, and ancient history of the tribe. These are subdivided into an infinite variety of lesser clans, each more or less honourable as they can trace their pure descent from the original and illustrious founders of their race. The character of the Rajpoots, as given by Bishop Heber on the authority of Captain Macdonald, the political resident of the Company in that district, is far from favourable. "The people," he observes, "who are generally oppressed, and have been, till very lately, engaged in incessant war, have the vices of slaves added to those of robbers, with no more regard to truth than the natives of our own provinces, exceeding them in drunkenness, fondness for opium, and sensuality, whilst they have a blood-thirstiness from which the great mass of the Hindus are very far removed. Their courage, however, and the gallant efforts they made to defend their territories against the Mahrattas, deserve high praise." They are extremely attached to their respective chiefs, to whom they yield a feudal obedience. The lands are let at low rents, on the condition of military service, every village furnishing its contingent of horsemen on the shortest notice. One of the chiefs who visited the above

Hindustan.

traveller, and who is said by him to have been a striking specimen of the tribe, is described as "young and handsome, but dirty in his dress, boisterous in his manner, talking with a great deal of gesticulation, many winks, nods, beckonings, and other marks of intelligence; and half drunk." Colonel Todd's work contains an accurate and instructive delineation of the manners and feudal relations amongst the Rajpootana chiefs; of their martial virtues, their romantic fidelity and honour, and their high pride, the parent at once of the noblest deeds and the deepest crimes; with which, according to their enthusiastic annalist, Colonel Todd, their history is stained. Family feuds are frequent amongst them, and last for centuries. They are handed down, as an inheritance, from generation to generation; and thus the debt accumulates with interest, "the deep reversion of delayed revenge," till it is extinguished in the blood of the hostile tribes. Hence murders, burnings, poisonings, mingle in their domestic annals with traits of generosity and romantic valour; and the modern Rajpoots, though they are certainly not improved, differ little in their manners and prejudices from their ancestors.[1]

The Bheels, another predatory tribe, inhabiting the mountains situated near the Nerbuddah and the Tuptee rivers, thence extending northward towards Rajpootana, westward towards the province of Gujerat, where they meet the Coolies, and eastward to Gundwana, where they come in contact with the Gonds, two other predatory tribes, are supposed to have been the aborigines of Central India. All these tribes are averse to industry, and subsist by plunder, by hunting, or by cultivation, when all other expedients fail. The Coolies near the sea-coast lived, until lately, by fishing or piracy. The Bheels inhabit the interior; and during the late unhappy era of disorder and rapine in India, terminated by the triumph of the British arms in 1817, they had by their inroads laid waste several districts, and were rapidly increasing in power. They were frequently hired by the native chiefs to assist in their desolating wars, as horsemen or as infantry, armed with bows and arrows, and nearly naked. Thieves and savages as they are, Bishop Heber found that the British officers stationed in that district thought them, on the whole, a better race than their conquerors. "Their word," he observes, "is more to be depended on; they are of a franker and livelier character; their women are far better treated, and enjoy more influence; and though they shed blood without scruple in cases of deadly feud, or in the regular way of a foray, they are not vindictive or inhospitable under other circumstances, several British officers having with perfect safety gone hunting and fishing into their country without escort or guide except what these poor savages themselves cheerfully furnished for a little brandy." The Bheels in the south of Malwah were partly reclaimed by the wise and conciliatory policy of Sir John Malcolm. But in Northern India, in the mountainous tract south of Odeypoor, they are differently treated, and severity has confirmed their primitive habits. To such extremities have they been inflamed, that they cut off the head of a messenger sent to them by the British with an offer of mercy, and fixed it on a bamboo, where it was found next morning, and fled further into the hills. The Gonds are a miserable race in Gundwana, who have been driven, like the Bheels, by their invaders, into the unwholesome fastnesses of the mountains. They approach nearly to a state of nature, and frequently descend from the mountains, especially during the harvest, to plunder their ancient inheritance in the plains. Having within the last fifty years acquired a taste for salt and sugar, they have begun to cultivate the land, in order to obtain these luxuries. The Gonds bear a striking resemblance to the African negro. The Grassias are another race of plunderers who are numerous in Gujerat, the most western province of India. They have or pretend to have ancient claims on the land, many portions of which were either surrendered to them by the proprietors for the secure possession of the remainder; or they received an annual payment in money (toda) in full of all demands, as black-mail was paid in Scotland to the Highland robbers during the disorders of the feudal times. The Grassias seldom levied these claims in person; but, assuming the character of chieftains, they rallied around them a band of adventurers, who levied their *grassia* claim, and who, under this authority, plundered and laid waste the country. These Grassias are of no sect or caste; they include Hindus and Mahommedans indiscriminately. But, of all these predatory races in Hindustan, the Coolies, who haunt the shores of the great salt marsh called the Runn, near the Gulf of Cutch, are the most untameable. They resist every approach to civilization, and pride themselves upon their mean and filthy dress. The tribes of thieves which are found in India, under the various designations of Grassias, Catties, Bhattics, or wandering outlaws who worship the sun and moon, Coolies, Bheels or Mewassies, Meenas, Buddicks, Cozauks, and the like, generally wander along the rugged banks of rivers, or among inaccessible mountains. The Bhats are a singular race, who are most numerous in Gujerat. Some are cultivators, others beggars and itinerant bards or traders; whilst a few are contractors for the payment of the public revenue, receiving a small per centage on the amount, or guarantee the observance of private agreements and awards. The Cherons are a sect of Hindus nearly resembling the Bhats in their manners and customs. They are carriers of heavy goods, such as grain and other articles, in which they are also dealers, and possess large droves of cattle for carriage. They are likewise engaged to protect travellers in the wild parts of the country, and take an oath to die by their own hands in the event of those who are under their protection being plundered; and the superstitious thieves of Hindustan are always overawed by this threat of the Cherons, whom they hold in great veneration.[2] The population of Hindustan contains other tribes or sects, too numerous and diversified to be described in detail, and differing, if not in language, at least in dialect, and in their manners, customs, and occupations. The Phasingars in the south of India, and the Thugs, are professional murderers; the latter are composed of men of all castes, even Brahmins, who, when murders are committed, are frequently the chief directors in the scene. Their practice is to decoy the traveller into the midst of their band, and then, drowning his cries by the noise of pretended revelry, to strangle him by suddenly throwing a noose round his neck, after which the body is cast into a grave previously dug for it. Another tribe, the Gwarriahs, who live by stealing women and children, are fast disappearing under the strict rule of the British. The Brinjarrees and Loodanahs, or carriers of grain, are a singular wandering race, who dwell in tents, and have no home; passing their whole time in transporting grain from one part of the country to another. They move about in large bodies with their wives, children, dogs, and loaded bullocks; and carry arms, with which they stoutly defend themselves against petty thieves. In war they are allowed to pass and repass quietly as neutrals between hostile armies, and to sell supplies of grain to either party. It was from the Brinjarrees that Lord Cornwallis received all the supplies for his army when he advanced against the capital of Mysore in 1799. The Oorians, a singular race, who inhabit Orissa, are distinguished by their feminine appearance, so that they are often mistaken for women. They are timid, dissolute in their manners, and more practised in low cunning than any other people in the East, though they are said to be honest and industrious. The pastoral tribes, the Todawars or Toderies, and the Koties, inhabit the table-land of Mysore; the first a manly race in features, and of a proud and independent character, strongly resembling the ancient Romans; the second more diminutive, with darker complexions, and less expressive features. They are considered as the aborigines of these highlands. The Toderies are herdsmen, wandering from pasture to pasture, and they and the Koties always go bare-footed and bare-headed. The Nairs in Malabar form a singular caste, from their peculiar manners and customs. Pretending to be soldiers by birth, they disdain all industry; and are often seen parading up and down fully armed, each man with a firelock, and with at least one if not two sabres, which they more frequently use in secret assassination than in open war. Amongst the Nairs marriage is a mere form, and both sexes indulge in a promiscuous intercourse. The women are married before they are ten years of age; but the husband never cohabits with his wife. He allows her a suitable maintenance, whilst she lives with her brothers, and cohabits indiscriminately with any person of an equal or higher rank. Owing to this irregular intercourse, no Nair knows his own father; and every man considers his sister's children as his heirs.[1] The Nestorian Christians are numerous in the south of India, and are a peaceful and industrious race. The Roman Catholics, the descendants of the Portuguese and French, or converts to their faith, amount to 600,000, and are sunk in idolatry not much superior to that of the Hindus. The foreign races in India are the mercenary Arabs, who are brave soldiers, ready to fight on any side for good pay; and the Chinese, who are fast increasing in Calcutta, and engross, by their skill as artisans, the principal business in the city. Another race has sprung up in India since the country was occupied by the British, who are known by the various names of Europeans, Anglo-Indians, Indo-Britons, half-castes, and the like, but who have now assumed the appellation of East Indians. They are the descendants of Europeans, either British or others, by native mothers, legitimate and illegitimate. They are estimated to amount, in the province of Bengal, to about 20,000, including men, women, and children. Nearly two thirds of this number reside in Calcutta, and there are about 10,000 more in the presidencies of Madras and Bombay. They speak the English language, and follow all the European habits, and the Protestant religion. But as they are an intermediate caste between Hindu and Mahommedan, they are not subject to, nor are protected by, the English law, and may, like the natives, be arrested by any of the courts, fined, imprisoned, and corporally punished at the discretion of the judge, without the intervention of a jury; though, in point of fact, no such severities are ever practised, being prevented alike by the force of public opinion, by the sentiments and feelings of the British rulers of India, and also by the respectable conduct of this mixed caste. They have been, since the year 1791, excluded by express enactments from the civil and military service of the Company, and are only eligible to subordinate situations in public offices; though of late years this exclusion was only applied in its rigour to the immediate descendants of European and Indian parents, all others being eligible to civil and military offices. Prior to 1791, the East Indians were freely admitted into the army, and several of them attained to the rank of generals and colonels, and commanded large bodies of troops with efficiency and success. Notwithstanding the restrictive law, there are still examples of their admission into the Company's service. Those who are not engaged in the public service follow other professions. Some have acquired high reputation and large fortunes by medical practice. Others are employed as planters, schoolmasters, architects, printers, carvers and gilders, or engaged in commerce. Mr Grant's measure, passed in 1833, for regulating the Company's affairs, abolishes these unjust and illiberal distinctions, and renders every class, of whatever caste or religion, eligible to all offices civil and military.[2]

[1] *Annals of Rajast'han*, vol. i. chap. 3.

[2] For a more full account of some of these tribes, see the article on GUJERAT, a province in which they abound.

Such are some of the principal tribes who inhabit the low country of Central and Northern India, "whilst the mountains and woods, wherever they occur, show specimens of a race entirely different from all these, and in a state of society scarcely elevated above the savages of New Holland or New Zealand." It is finely observed by Sir John Malcolm in his history of Persia, that, in the conquest of a country, the rocks and the mountains often afford a last asylum to the brave and the free; and accordingly, many of the native tribes in Hindustan, flying from the destroying sword, have thus maintained for ages a savage independence, and all the distinct traces of an original race. The elevated tract which Bengal includes towards its western frontier, reaching from Rajamahal to Burdwan, is inhabited by several tribes of mountaineers, who are probably the aborigines of the country; and, from their features, language, civilization, and religion, are obviously of a different stock from those in the plains. Amongst the Puharrees, who inhabit this tract, the Hindu institution of castes is unknown; the Hindu deities are equally so; and they have no idols, being nearly in the condition of savages. They subsist by the chase, their arms are bows and arrows, and they are nearly naked. They formerly waged incessant war with the cultivators of the plains, whom they robbed and murdered, and were in their turn hunted by the Mahommedan zemindars like wild beasts. Having been kindly treated and conciliated by the British, they are so far reclaimed from their wild habits, that a battalion of sepoys has been raised from amongst them. The peculiar features of the rude tribes in the eastern hills of Bengal, and the adjacent plains, equally indicate a distinct origin. The Kookies, who live in the mountains to the north-east of the Chittagong district, have all the peculiar features of a Tartar countenance; the flat nose, the small eyes, and the broad round face. They are stout and muscular, though not tall; and they are hunters and warriors, armed with bows and arrows, clubs and spears. They live in the most inaccessible hills, in a state of constant warfare, and, like all savages, are cruel and vindictive.

Religio

The inhabitants of Hindustan rank much lower in the scale of civilization than the nations of Europe. They are far behind them in literature, science, and the arts, and in all the civil institutions of society; and their religion is that of a rude people, consisting in an endless detail of troublesome ceremonies, which are deeply interwoven with the whole system of life. The reason of man, in contemplating the wonders of creation, is directed by the light of nature to one great first cause, and in the structure of the universe are clearly seen the divine attributes of goodness, wisdom, and almighty power. Accordingly Brahm, or God, is declared, in many passages of the Vedas or sacred writings of the Hindus, to be the almighty, infinite, eternal, self-existent being, who sees all things, and is everywhere present; the creator and lord of the universe, its preserver and its destroyer, who can neither be described nor adequately conceived by the limited faculties of man. But with these elementary conceptions of the divine majesty other grosser ideas are combined, and a system of polytheism, accompanied by the most extravagant and obscene fables, and all the disgusting, cruel, and blood-thirsty rites of an abominable idolatry. Whilst Brahm, the Supreme Being, is supposed to remain in holy obscurity, he has distributed respectively to three other deities, Brahma, Vishnu, and Siva, the power of creating, preserving, and destroying the world. But it does not appear that these deities are strictly confined to their separate functions; Vishnu, the preserver, frequently employing himself in acts of destruction; and Siva, on the other hand, in acts of beneficence. In short, the Hindu creed presents no clear nor determinate ideas. All is vague, inaccurate, and confused. Brahma, the creator, is represented as a golden-coloured figure, with four heads and four arms. Vishnu, the preserver, is represented of a black or blue colour, with four arms, and a club to punish the wicked. The emblems under which he is represented refer to his vindictive character. He has three eyes, to denote the three divisions of time past, present, and future. A crescent in his forehead refers to the measuring of time by the lunar revolutions, as a serpent denotes it by years; and the necklace of skulls which he wears, the extinction of mankind in successive generations. The great ends of his providence are brought about by various incarnations of the Hindu deity. Of these visible appearances, denominated avatars in the Hindu mythology, there are ten, of which nine have already taken place; and although the Hindu account of what took place at these times is a tissue of absurdity, extravagance, and indecency, yet we may trace, under a mass of fable, the Scripture account of the deluge, with various other points of the Christian theology. But the history of the creation from a seed deposited in the waters, which became an egg, from which Brahma the creator was born, is in the highest degree absurd and profane. At the tenth avatar, which is yet to come, Vishnu, as is foretold, will appear on a white horse, with a scimitar blazing like a comet, for the everlasting punishment of the wicked who shall then be on the earth. Each earthly incarnation of the divinity gives rise to a new deity; and there are, besides, innumerable other minor deities, amounting, it is said, to 330 millions. All the great elements of nature are deified by the extravagant superstition of the Hindus; also the firmament of heaven, the sun, moon, and stars; every river, fountain, and stream, is either a deity in itself or has a divinity presiding over it, nothing being done without some supernatural agency; and there are, besides, innumerable myriads of demigods, to whose honour idols are erected and worshipped by all classes with much apparent devotion. Stocks and stones, or a lump of clay smeared over with a little red paint, are converted into a god, and reverenced, by the ignorant Hindu. Any figure, either of brute or man, or any monstrous combination of both, with a multiplicity of heads and hands, mark a Brahminical place of worship. In the lapse of ages, great changes have been introduced into the religious practices of the Hindus; and sectaries have arisen amongst them, each with peculiar objects of adoration and modes of worship. Five great sects worship exclusively a single deity; one recognises the five divinities that are respectively reverenced by the other sects, but they select one object for daily adoration, whilst they perform only occasional rites to the other deities. The Vedas, or the Hindu Scriptures, were revealed before the appearance of Buddha, the ninth incarnation of Vishnu, which is supposed to have taken place in the year 1014 before the Christian era. He appears to have borrowed his theology from the system of Capila, in which the unlawfulness of killing animals is inculcated as an essential point. But the overthrow of the Buddhists did not revive the religious system inculcated in the Vedas. The doctrines taught in these sacred books are now mostly obsolete, and in their stead new forms and ceremonies have been instituted, and new orders of devotees. In particular the goddess Kali, the consort of Siva, who delights in blood, has been propitiated by the sacrifice of animals; and the worship of Rama and Krishna, incarnations of Vishnu, and of Siva the destroyer, appears to have been introduced since the persecution of the Buddhists and Jains.

[2] Minutes of Evidence before Select Committee on the Affairs of the East India Company, on a Petition of certain Christian Inhabitants of Calcutta, &c. presented to the House of Commons on the 4th May last; 21st June 1831.

The worshippers of Buddha, though they believe in the incarnation of Vishnu, are regarded as heretical by the Hindus, and have been compelled, by persecution, to fly to other countries. They have now propagated their faith over the greater part of Eastern India, in China, and as far as Japan; also in Thibet and Ceylon. The Jains are another sect of Hindus, who acknowledge only as subordinate deities some, if not all, of the gods of the Brahmins, and the prevailing sects; and assign the highest place to certain deified saints, who, according to their creed, have risen to the dignity of superior gods. They neither address prayers nor perform sacrifices to the sun or the fire; and they reject the authority of the Vedas, as do also the Buddhists. The presence of umbrella-covered pyramids, or semi-globes, and of plain human figures sitting cross-legged, or standing in an attitude of contemplation, point out the temple or excavation of a Buddhist. The twenty-four saintly figures, without the pyramid, indicate a Jain temple.

The sacred books of the Hindus, though they inculcate generally all the moral duties of justice, mercy, and benevolence, yet seem, like every other system of false religion, to give the first place to the ceremonial law; and accordingly the devotion of the Hindus consists in mere outward observances, and is not inconsistent with the most scandalous crimes. Under the Christian system, there can be no piety to God without benevolence to man. But the troublesome ceremonies of the Hindu religion encroach, not only on all moral duties, but on the whole business of life; and confer such a stock of atoning merit that they seem to supersede the weightier matters of the law. The observances which are imposed upon a Brahmin commence when he rises in the morning, and consist in divers ablutions and prayers, in the worship of the rising sun, in the inaudible recitation of the gayatri, or the holiest text of the Vedas, in holy meditation, and in other ceremonies. He has then to perform the five sacraments, which consist in teaching and studying the scriptures, which is the sacrament of the Veda; in offering cakes and water, which is the sacrament of the manes; in an oblation of fire, the sacrament of the deities; in giving rice and other food to living creatures, which is the sacrament of spirits; and in receiving guests with honour, which is the sacrament of men. The whole day would not suffice for the punctual performance of these ceremonies; and they are of necessity abridged, to give time for the proper business of life. In almost all the religious traditions of the world we find traces of the Scripture revelation, however corrupted; and the Hindu system seems to have borrowed, and to have greatly extended, the typical impurities of the Mosaic law. The rules on this subject, pointing out the causes of defilement, and the modes of purification, are numerous, many of them to the last degree absurd and troublesome. The death or the birth of a child renders all the kindred unclean. Any one who touches a dead body, a new-born child, an outcast, &c. is unclean; or a Brahmin who has touched a human bone. The natural functions of the body give occasion to many minute and disgusting regulations; and the modes of purification are equally strange and ridiculous. Of these, bathing is the most rational; the other modes are by stroking a cow, looking at the sun, or having the mouth sprinkled with water. He who is bitten by any animal frequenting a town, or by a mare, a camel, or a bear, is unclean; and he is purified by stopping his breath during one inaudible repetition of the gayatri. Inanimate substances may also be unclean, and the various modes of purifying them rival in absurdity the other extravagances of the Hindu code of religious observances.

The expiation of sin by voluntary penance is another favourite doctrine of the Brahmins, by which they contrive to awe superstitious minds into subjection; and in their estimate of offences, with a view to suitable penances, they subvert all moral distinctions. "Acts naturally indifferent," says the author of *Indian Recreations*, "are put on the same footing with immoralities; eating certain articles of food, drinking certain liquors, or touching certain objects, are declared forfeitures, and are expiated by penance as immoral conduct. Forgetting texts of scripture is classed with perjury; eating things forbidden, with killing a friend; incest and adultery are compared to slaying a bull or a cow; drinking forbidden liquor, to killing a Brahmin. In several instances, actions highly meritorious according to our notions, are put on the same footing with a conduct implying great infamy. Working in mines of any sort, engaging in dykes, bridges, or other great mechanical works, is classed with subsisting by the harlotry of a wife, and preparing charms to destroy the innocent."[1] To these artificial offences, penances are either affixed by the Brahmins, or are voluntarily undertaken by their pious votaries; and these generally consist in fasts, mortifications, watchings, and other bodily privations. "If a Brahmin," says Menu, "have killed a man of the sacerdotal class without malice, he must make a hut in a forest, and dwell in it twelve whole years, subsisting on alms, for the purification of his soul. If the slayer be a king, he may perform sacrifices, with presents of great value; if a person of wealth has committed this offence, he may give all his property to some Brahmin learned in the Veda." In some cases the penances consist in eating what is filthy and disgusting. If a Brahmin kill by design a cat, or an ichneumon, the bird chisha, or a frog, a dog, a lizard, an owl, or a crow, he must perform the ordinary penance required for the death of a Sudra, one of the lowest caste, who are thus no more valued than a cat or a frog. A particular class of devotees, namely, the Fakirs, signalize their piety by enduring the severest tortures, and with a constancy worthy of a better cause. Bishop Heber describes, with his usual force, the appearance of these eastern monks as he entered the holy city of Benares. "Fakirs' houses," he observes, "as they are called, occur at every turn, adorned with idols, and sending forth an unceasing tinkling and strumming of vinas, byyals, and other discordant instruments; while religious mendicants of every Hindu sect, offering every conceivable deformity which chalk, cow-dung, disease, matted locks, distorted limbs, and disgusting and hideous attitudes of penance, can show, literally line the principal streets on both sides. Here," he adds, "I saw repeated instances of that penance of which I heard much in Europe, of men with their legs and arms voluntarily distorted by keeping them in one position, and their hands clenched till the nails grew out at the backs. Their pitiful exclamations as we passed, '*Agha Sahib, Topee Sahib*,' the usual names in Hindustan for an European, '*khana ke waste kooch cheez do*,' give me something to eat, soon drew from me the few pence I had; but it was a drop of water in the ocean; and the importunities of the rest, as we advanced into the city, were almost drowned in the hubbub which surrounded us."[2] The tortures which these fanatics endure exceed all belief. A penitent who went through the ceremony of sitting between five fires, is described by Fraser, who witnessed the penance at a public festival. Being seated on a quadrangular stage, after the sun began to have considerable power, he stood on one leg gazing stedfastly at its scorching beams, whilst fires large enough, says the traveller, to roast an ox were burning around him, the penitent counting his beads, and occasionally adding fuel to the flames. He stood upright on his head in the midst of these fires for three hours; and then seating himself with his legs across, he remained till the end of the day exposed to the scorching heat of both the sun and the fires.[3] Other cruel and bloody rites are contrived by those devotees, the worshippers of Siva or his consort the goddess Kali. At one of the festivals in honour of this goddess, Bishop Heber, who was present, relates, that one of these self-tormentors had hooks thrust through the muscles of his sides, which he endured without shrinking, and a broad bandage being fastened round his waist to prevent the hooks from being torn through the flesh by the weight of his body, he was fastened to a long pole, and, by means of another pole fixed in the ground, he was swung aloft and whirled round in the air; on a motion being made to take him down, he made signs for them to proceed, a mark of constancy received with shouts of applause by the ignorant multitude. Other devotees were seen going about with small spears thrust through their tongues and arms, or with hot irons pressed against their sides. Bishop Heber saw another of these penitents who was actually half roasting himself by a fire which he had kindled in a hole dug in the ground; another was seen hopping on one foot, having made a vow never to use the other, which was now contracted and shrunk up; and a third had held his hands above his head so long that he had lost the power of bringing them down to his sides. Some are seen buried up to the neck in the ground, or even deeper, with only a small hole for breathing. Some lie on beds of iron spikes, or tear their flesh with whips, or chain themselves for life to the foot of a tree, or remain in a standing posture for years, till their legs swell, and break out into ulcers, and become at last too weak to support them; others exhaust their bodily strength with long fasting, or gaze on the blazing sun, till their eyesight is extinguished. These devotees subsist entirely by charity; and Dr Buchanan mentions a class of them in the south of India, who wander about with bells tied to their legs and arms, in order to give notice of their presence as they approach the villages.[4] They are always naked, and filthy in the extreme, being covered with cow-dung and chalk; and for the tortures which they endure in public they indemnify themselves in private by the utmost license of sensual indulgence.[5] Amongst other observances, the Hindus have always been much given to religious pilgrimages; and their holy places have been generally established near the sea, the sources and junctions of rivers, which are held in peculiar veneration, the tops of remarkable hills, hot springs, caves, waterfalls, or any other place of difficult or dangerous access. A pilgrimage to Gangoutri, near the sources of the Ganges, is accounted the great achievement of Hindu piety. To the waters of this river the superstitious Hindu ascribes peculiar sanctity, and devoutly worships it throughout its whole course. But there are particular spots more sacred than others; and so great is the resort of pilgrims, and such their ardour to wash in the sacred stream, that numbers, in the crush and tumult, are hurried into the water and drowned, or trodden to death in the crowd.

It is not doubted that, at a period not very remote, the bloody deities of the Hindus were propitiated with human sacrifices, and some of the rites still in use amongst them confirm this suspicion. The Brahmins, in resisting any demand which they conceive to be oppressive, resort to a contrivance, in which a human victim is really sacrificed. They erect a circular pile of wood, on the top of which they place a cow or an old woman; and if the demand is insisted on, they set fire to the pile, and consume the sacrifice, which is supposed to entail on the oppressor the deepest guilt. Bishop Heber gives, in his narrative, an example of the sacrifice of an old woman, who, in a quarrel which her husband had with his neighbour respecting some land, was thrust into a Mahbout's hut, and there burned, in order that her spirit might haunt the spot, and entail a curse upon the soil. Children were also formerly sacrificed, by throwing them to the sacred sharks of the Ganges, till the practice was forbidden by the British government; and a voluntary sacrifice of themselves by individuals, in honour of the gods, is still reckoned meritorious. At the festival of Juggernaut, the idol is placed on a ponderous machine or chariot, and dragged forward by a crowd of devotees and priests, when numbers of the people, even fathers and mothers, with their children in their arms, throwing themselves in the way of the chariot, and being crushed to death under its ponderous wheels, amidst the fanatical cries of the multitude, are supposed to be conveyed immediately to heaven. Numerous victims of both sexes drown themselves annually at the junction of the sacred streams;[1] many strike off their own heads as a sacrifice to the Ganges, whilst others expiate their sins by casting themselves into the avenging flames. This act of devotion is accompanied by atrocities that are truly shocking, the devotee previously laying open his bowels with the stroke of a sabre, tearing out his liver and giving it to a byestander, conversing all the time with apparent indifference.[2] Many other enormities are practised at the festivals in honour of their gods, which it would be endless and disgusting to detail. The custom of a widow burning herself on the funeral pile of her husband is a noted rite of the Hindu religion, by which she is supposed to expiate all her husband's crimes, however great, and to secure for herself the joys of paradise. It is most frequent in Bengal and near Benares, and is much encouraged by the Brahmins. The Hindus in this, as in many other instances, evince a singular indifference about their own lives; which also appears in the frequent instances of suicide amongst them. "Men," says Heber, "and still more women, throw themselves down wells, or drink poison, for apparently the slightest reasons, generally out of some quarrel, and in order that their blood may be at their enemy's door." Obscenities mingle with these bloody rites, and the most indecent figures are pourtrayed on the chariots used at the temples, many of them large and richly carved. "These," says Dr Buchanan, "representing the amours of the god Krishna, are the most indecent that I have ever seen."[3] Equally indecent representations are carved on the sacred cars fixed at the temples, in which the musicians and dancing girls are all prostitutes to the Brahmins, and turned out to starve when they grow old, unless they have a handsome daughter to support them from the wages of iniquity. The state of morals among the Hindus is such as might be expected from a religion so impure, and from the gross emblems which are used on sacred occasions; their writings and their conversation are shocking to European ears; and even the Hindu women hear without a blush and join in language the most gross and disgusting. They are sensual in all their ideas, and pursue the intercourse of the sexes with little more discrimination than the brute creation. Fidelity to marriage vows is scarcely known amongst them, at least amongst the men.

A superstitious tenderness for the brute creation is a peculiar tenet of the Hindu creed, which prohibits the use of animal food excepting at the great festivals, when the sacrifices of beasts propitiate the bloody deities, and serve the natives for a feast.[4] But the same abstinence from animal food is not general throughout Hindustan. In the north of India it has already been mentioned that it is freely used by the inhabitants; and, according to Dr Buchanan, there are castes in the south of India who eat sheep, goats, hogs, fowls, and fish, though there are others who religiously abstain from these, and from all spirituous liquors.[5] Several animals, as the cow and the monkey, are objects of veneration. Bishop Heber, so often quoted, mentions, that on entering the holy city of Benares, "the sacred bulls devoted to Siva, of every age, tame and familiar as mastiffs, walk lazily up and down the narrow streets, or are seen lying across them, and hardly to be kicked up; any blows, indeed, given them must be of the gentlest kind, or woe be to the profane wretch who braves the prejudices of a fanatic population, in order to make way for the tonjon. Monkies, sacred to Hunimaum, the divine ape, who conquered Ceylon for Rama, are, in some parts of the town, equally numerous, clinging to all the roofs and little projections of the temples, putting their impertinent heads and hands into every fruiterer's or confectioner's shop, and snatching the food from the children at their meals."[6] To such a length is this superstition carried, that they have established an hospital for sick and infirm beasts, and for fleas, lice, and insects, though it does not appear, as reported by some travellers, that they feed these loathsome creatures on the flesh of beggars hired to lodge in the hospital for that purpose. An hospital for animals is to be seen at Broach in Gujerat, which has considerable endowments in land, and in which are monkies, peacocks, horses, dogs, cats, and little boxes filled with fleas and lice. This hospital was described to Bishop Heber by the British commercial agent resident at Broach. The funds, however, are said to be alienated by the avaricious Brahmins, and the animals allowed to starve. With all this veneration for animals, they are nowhere more cruelly treated. They are overworked and abused in a manner shocking to a European. "They treat their draft horses," says Bishop Heber, "with a degree of barbarous severity which would turn an English hackney coachman sick;" nor do they show any greater sympathy for human beings, who are allowed to perish before their eyes from hunger or disease. Lepers, according to their base and irrational superstition, are treated as objects of the divine wrath; they are cruelly neglected, and regarded with abhorrence rather than with sympathy.

The transmigration of souls is another favourite tenet of the Brahmin superstition. The souls of good men migrate in the next world into hermits, religious mendicants, Brahmins, demi-gods, genii, or other celebrated intelligences; and the best ascend to the condition of Brahma with four faces. The next gradation allotted to souls filled with passion is into men and not into deities, into cudgel players, boxers, wrestlers, actors, or those of a higher class into the bodies of kings, and the highest become genii, attendants on the superior gods; whilst souls filled with darkness are degraded into the lower animals, such as worms, reptiles, cattle, &c. or into elephants, horses, Sudras (the lowest caste), or into the still more degraded class of men of no caste, or into lions, tigers, &c.; to the highest are allotted the forms of dancers, singers, &c. birds, giants, blood-thirsty savages. Particular migrations are assigned as the punishment of certain enormities; but it is useless to pursue the system further into its absurd and disgusting details,

Manners.

The religion of Hindustan is so closely interwoven with its customs, manners, and laws, that they can scarcely be described separately. The division of a Hindu community into castes is an institution, not of policy, but of religion, which embraces the whole detail and intercourse of life. There are four original or pure castes, namely, 1*st*, the Brahmins, or priests; 2*d*, the Cshatriyas, or military caste; 3*d*, the Vaisyas, or husbandmen; and, 4*th*, the Sudras, or labourers. Of these the Brahmins are declared to hold the first rank, and to be the lords of all the other classes. A want of due reverence to them, especially by the lowest or the Sudra class, is accounted one of the most atrocious crimes. The laws and manners equally concur to maintain the honour, and all the substantial privileges, of this sacred order. They are exempted from taxation, and from the sanguinary laws which affect the other classes. Neither the life nor property of a Brahmin can be touched, even though he commit the most atrocious crimes; and the whole scope of the Hindu religion is to heap gifts and wealth upon them. "Every offence," says Orme, "is capable of being expiated by largesses to the Brahmins, prescribed by themselves, according to their own measures of avarice and sensuality."[1] The duties of the Brahmins are to meditate on divine things, to read the Vedas, to instruct the young Brahmins, and to perform sacrifices and other religious acts. The Cshatriyas, or the military rank, is next in order to that of the Brahmins. Their duty is to bear arms in defence of the state, and they rank as high above the lower orders as the Brahmins do above them. The Vaisyas, the third caste of Hindus, tend cattle, or engage in trade and agriculture. They rank only above the Sudras, from whom, however, they receive the same deference and submission which they give to the higher castes. To the Sudra, or the lowest class, are allotted all the meanest and most servile duties; they are regarded with abhorrence by the other tribes, to whom religion prescribes their most abject submission, as well as every other species of degradation. They are in a manner excluded from the privileges of the social state. They pay a higher rate of interest for money than any of the other classes, they are more cruelly punished for crimes committed against them, whilst an injury to a degraded Sudra is a light and venial offence. They are held to be in a state of slavery, they cannot possess property, and at any time a Brahmin may seize the goods of his Sudra slave. So degraded are they, that under this gloomy, unsocial superstition, a Brahmin cannot lawfully read the Veda in presence of any of them, nor give them spiritual counsel or instruction, under pain of sinking with them into hell. To each of these classes, into which society is divided, are assigned, under the severest penalties, particular and hereditary employments. But the rigid severity of this law is softened by the following exceptions. A Brahmin who cannot find employment in his own spiritual line, may descend to the exercise of military duties, or to tillage and attendance on cattle, or to traffic, only avoiding certain commodities. In like manner, a Cshatriya in distress may have recourse to all inferior employments, though not to the higher duties of the Brahmins. The practice of medicine and other learned professions, of painting and other arts, common labour, menial service, begging, or serving, may be resorted to upon the plea of necessity. A Vaisya may descend to the servile work of a Sudra; and a Sudra may subsist by handicrafts, as joinery, masonry, painting, and writing, by which he may serve the higher classes; or by trade or husbandry. The loss of caste is one of the most serious calamities which can befall a Hindu, and may in fact be compared to the spiritual anathemas of the Catholic church during the dark ages of Europe. If the loss of caste were the penalty of immorality, the fear of it would impose a salutary restraint. But this is far from being the case. The most abandoned Brahmin retains his rank, notwithstanding his crimes; but he will entirely forfeit it and lose all countenance in society by touching impure food, or by some such petty delinquency. To sit down at a meal with one of an inferior caste, would be deemed a monstrous pollution; and a naked Hindu would think himself defiled by the presence of the first monarch of Europe at any of his meals. "While dinner is preparing," says Tennant, "and during eating, a small circle is drawn round the company, which an European, if he pass, infallibly defiles the meal; it is thrown to the dogs, and other victuals provided, though a single one be all the treasure of the family."[2]

Such may be considered as in theory the structure of a Hindu community. But since, in the progress of society, this strict division into classes with distinct employments could not long be maintained, we accordingly find that, by illicit connexions, the pure races are intermixed, and children born who, being of no caste, are therefore impure, and objects of execration to all the other tribes. This impure race, denominated the Burren Sunker, and classified into distinct tribes, have become artisans and handicraftsmen of every description. From the intermixture of these various races innumerable mixed tribes have sprung, and the pure blood of the four original tribes is scarcely to be found; so that Mr Rickards, in his accurate account of Indian manners, says, "I have never met with a person who could prove himself a genuine Cshatriya, Vaisya, or Sudra; whilst of those who pretend to be of pure descent, Brahmins and other respectable and intelligent Hindus have assured me that they have no right to the distinction; that the genuine tribes above named are extinct, and their descendants in this generation all of mixed blood. If, however, any do now exist, they must be too thinly scattered to affect the general interests of society by their privileges or numbers. "A real Cshatriya prince," he adds, "is not to be found in these days; all the greater princes of India, excepting the peshwa, a Brahmin, are base-born."[3] Nor, amidst this confusion of ranks, has it been possible to adhere to the strict allotment of certain employments to particular castes. The Brahmins no doubt still form a distinct order; their privileges are willingly conceded to them by the superstitious multitude, and the inferior castes have never encroached on their holy functions. But those of the other castes have been confounded. War has not been the exclusive employment of the Cshatriya caste; for the Indian armies are recruited from all denominations and castes. Nor have the Vaisya and the Sudra castes been more successful in the monopoly of their employments; seeing that all the various castes follow their allotted duties, and fill every branch of agriculture, commerce, handicraft, and menial service.[4] But the institution of castes, though it has not been strictly acted upon, being at variance with the fixed order of human society, has nevertheless deeply affected the aspect and structure of the Hindu communities; and whilst it exalts the order of priests, it degrades the lower classes to the level of the brutes. It is the source of cruel and anti-social prejudices, entirely opposite to those Christian feelings of benevolence by which man is bound to his fellow men; and by which the different orders of society, instead of being harshly separated, are softened and blended, as in the communities of Europe, into one harmonious whole.

Besides these degraded castes, whose condition is little better than that of slaves, numbers of unfortunate persons are reduced to actual slavery throughout India, especially in the southern provinces, and in the Mahratta states. In Mysore, Coorg, Cochin, and Travancore, slavery prevails. All the jaghiredars, zemindars, principal Brahmins, and talookdars employ domestic slaves in their establishment; and in every Mahratta household of consequence they are considered as indispensable. They are also employed in the labours of the field, in the cultivation of rice, and are in the lowest state of degradation, ill-fed and worse clothed, and most wretched in their appearance. They are often extremely ill treated, and may be flogged at the discretion of the master, imprisoned, or put in the stocks; and there is hardly a criminal calendar which does not contain cases of wounding or even murdering slaves. Many are born slaves; some are kidnapped by men-stealers of a particular class, or are made prisoners in battle; others are sold into slavery in times of famine by their parents. Numbers are imported from the Persian Gulf, the Red Sea, and the coasts of Africa; some bind themselves for a time, or for life, in discharge of a debt. The population of Canara, amounting to 600,000, and in 1827 to a million, according to the estimate of Mr Harris, the principal collector, included 80,000 slaves. In Malabar there were, in 1806, 96,386 slaves in a population of 700,000, and out of 1,003,466 in 1827, 20,000 were prisoners of war or their descendants. In the report of the commissioners of Bengal and Bombay, of which Mr Jonathan Duncan was president, it is stated, that on the first settlement of Malabar in 1793, the degraded castes were in a state of villenage, and attached to the soil. It was the practice of the British to sell these slaves off the estate in default of the public dues, and in many cases to separate parents from children, wives from husbands, and thus to rend asunder the ties of kindred. The sale of slaves in the southern Mahratta states has been prohibited by a regulation of the governor-general and council; and in 1819 the practice of selling slaves for arrears of rent was ordered to be discontinued by the board of revenue. Children are sometimes kidnapped and sold for slaves; and the superintendent of police at Madras says, "I succeeded in 1818 in restoring several such children to their parents amongst the lowest and poorest of the Hindus; and their anxiety to recover infants whom they in all probability found it very difficult to support, would have done honour to the highest classes of European society."[1]

The Hindus are by no means a moral people. Notwithstanding the gentleness and feminine softness of their manners and address, they frequently commit the most revolting acts of cruelty. The practice of murdering children for the sake of the silver ornaments in which, by the vanity of their parents, they are attired, is common among them; and the gang-robbers of India are noted for the horrible tortures which they inflict on their unhappy victims, in their eager search after their hidden treasures. "Pestilence, or beasts of prey," says Dr Buchanan, "are gentle in comparison of Hindu robbers." According to the observation of Orme, the politics of Hindustan would afford in a century more frequent examples of sanguinary cruelty than the whole history of Europe since the reign of Charlemagne. "How many princes," observes this writer, "have been stabbed in full durbar" (in open court). "How many have been poisoned in their beds. Chiefs of armies circumvented and cut off at conferences in the field. Favourite courtiers strangled, without previous notice of their crime, or while they thought themselves on the eve of destroying their masters."[2] Murders amongst the Hindus, even by poison, excite no feeling of deep abhorrence, as among the nations of Europe; and the cold-blooded villany of the Hindu is often remarkable. Mr Holwell mentions, that when he sat as judge at Calcutta, he had heard it stated in defence of the most atrocious murders, that it was the Cali age, when men were destined to be wicked.[3] The Hindus, like all the other Asiatics, are great masters of dissimulation; they are cunning and treacherous, addicted to falsehood to a degree that can scarcely be conceived by a more refined and moral people. Perjury in courts of justice is universal, amongst high as well as low, and amongst both the Hindus and Mussulmans, without the least remorse or shame. The Europeans in the office of judges in India complain of being perplexed by a host of perjurers on each side, swearing in the teeth of one another. They are acute dissemblers in all affairs of interest, and are the sharpest buyers and sellers in the world, maintaining through all their bargains a degree of calmness which no art can penetrate.[1] A want of sympathy with the sufferings of his fellow-creatures is another trait of the Hindu character, and a sure index to the low state of refinement amongst them. They treat their sick and dying with indifference, and in many cases with shocking inhumanity. The sick whose life is despaired of are carried to the banks of the Ganges, and their mouth, nose, and ears are closely stopped up with mud; water is then poured upon them from large vessels, and thus, amidst the agonies of disease and of suffocation, life terminates. The corpse is then burned, if the survivors can pay the expense, and the relatives retire with every appearance of insensibility.[2] The effeminacy of their persons, and their timidity, prevent them from fighting or boxing in their quarrels. But this forbearance seems to proceed from no want of malignity or passion, as, in the event of any misunderstanding between two persons meeting accidentally in the street, they upbraid each other with the foulest epithets, accompanied by the utmost violence of gesticulation.

---

[1] See Papers relative to slavery in India; Return to the House of Commons, 6th March 1834; Evidence of Joseph Fenn, nine years a missionary in Travancore; Answers to Questions on Slavery, circulated by the Commissioners for the affairs of India; Evidence of T. H. Baber, Esq. thirty-two years resident in India; of the Honourable J. Harris, principal collector in Canara; and of Mr Warden, collector in Malabar. The evidence of T. H. Baber discloses a regular and shameful traffic in slaves, carried on by Mr Brown, a servant of the Company, and under the authority of the Bombay government. "How or whence," he observes, "this oppressive and cruel practice, not only of selling slaves off the estate where born and bred, but actually of separating husbands and wives, parents and children, and thus severing all the nearest and dearest associations and ties of our common nature, originated, it would be difficult to say; but I have no doubt, and never had in my own mind, that it has derived support, if not its origin, from the impolitic measure in 1798, of giving authority to the late Mr Murdoch Brown, while overseer of the Company's plantations in Malabar, from the difficulties he experienced, even with 'the assistance of the tchsildar' (the head native authority) and 'his peons' (armed persons with badges of office), to procure workmen, and 'of the price of labour being more than he was authorized to give,' to purchase indiscriminately as many slaves as he might require to enable him to carry on the works of that plantation; and of actually issuing orders to the European, as well as to the native local authorities, to assist him, and even to restore slaves who had run away and returned to their homes (without any orders to inquire the reason of their absconding), and who, as has been actually ascertained from the surviving slaves themselves, had been actually kidnapped by the doragha (head police officer), and sent up to North Malabar, to Mr Brown, which person had continued up to 1811, or for a period of twelve years, under this alleged authority, granted by the Bombay government, to import slaves and free-born children from Travancore, when, by the merest accident, this nefarious traffic came to my knowledge, and which, *after a considerable opposition on the part of the provincial court of circuit*, I succeeded in putting a stop to, after having restored to liberty and their country 123 persons who had been stolen, of whom 71 were actually found in Mr Brown's possession." Mr Brown's agent, Assen Ally, acknowledged, that during the time he was at Aleppi, at Travancore, in 1810, no less than 400 children had been transported to Malabar. The advocate-general's report alludes to "Mr Baber's perseverance in restoring the kidnapped children, in spite of very extraordinary opposition," and to the "extraordinary support Mr Brown appears to have received in these dealings in stolen children." (Fol. 788.) The still more objectionable practice of realizing the public dues by the seizure and sale of slaves off the land, must have confirmed proprietors in their idea of accounting the slaves their property. Mr Vaughan, collector, Malabar, in a letter dated 20th of July 1819, argues in favour of this inhuman practice, saying, "that the partial measure of declaring them not liable to be sold for arrears of revenue, will be a drop in the ocean; though, why government should give up the right every proprietor enjoys, is a question worthy of consideration." Par. 3, 4, 5, &c. Highest class slaves sold for 250 gold fananas, L.6. 5s.; average price, L.3. 6s.

[2] Orme's *Historical Fragments of the Mogul Empire*, p. 340.

[3] Mill, vol. i. p. 407.

Mr Rickards, in his valuable work upon India, seems to imagine that European writers have exaggerated the vices of the Hindus, and he exhibits them in a more favourable light. "Having lived," he observes, "twenty-three years in India, and passed much of that time in intimate intercourse with various natives, I have a different opinion of their character to that given in several printed works. I have constantly seen, in their acts and conduct, the practice of the most amiable virtues. I have experienced from many the most grateful attachment. I believe them capable of all the qualities that adorn the human mind; and though I allow many of their imputed faults (where is the individual or nation without them?) I must still ascribe these faults more to the despotisms under which they have so long groaned, and which unhappily we have but slenderly alleviated, than to natural depravity of disposition, or to any institutions peculiar to themselves."[3] No writer ascribes to the Hindus any greater natural depravity than other nations. But certainly their peculiar religion, its indecent and bloody rites, and the laws and usages founded on it, more especially the institution of castes, tend to extinguish in the breast all humane, enlightened, or moral feelings; and though, even amongst the Hindus, exceptions may be found, and the occasional practice of amiable virtues, yet the crimes which are proved to be committed openly and without shame or remorse sufficiently attest the want of morality, intelligence, and every humane and social feeling amongst them, and seem to place them in this respect entirely on a level with the other Asiatic nations. Ignorance is the parent of cruelty and vice, and with the progress of knowledge and of civil institutions certain crimes entirely disappear; and hence their existence amongst the Hindus bespeaks not so much any innate or peculiar depravity, as a low state of civilization, and a state of thraldom to a base superstition and to the dominion of priests, under which the social virtues are blighted in the bud, and selfishness and vice spring up in the congenial soil.

In every nation the condition of the female sex affords a sure index to the state of manners and the progress of civilization. Amongst savages, women are ill treated because they are weak and helpless, and there is no moral restraint on the tyranny of the men. In Hindustan, as over all the East, where polygamy prevails, they are a degraded caste, shut up in the harem or the seraglio, and not, as in Europe, the seat of a purer faith and more refined system of manners, the friends, the advisers, and equal companions, of their husbands. And both the laws and manners of the East lead to this unhappy effect. Whilst marriage is enjoined as a religious duty, not to be neglected except for the higher duty of becoming a devotee, the character of women is described in the Hindu books of law as stained with almost every vice. Pride, anger, envy, violence, deceit, falsehood, immoderate desires, infidelity to their husbands, and idleness, are pointed out as their ruling passions; and the treatment they meet with corresponds with those ideas. They are wholly uneducated, excluded from the sacred books, and from all knowledge of expiatory texts, and from any share in the paternal property; and they are held unworthy to eat with their husbands. They are the slaves of their domestic tyrants, and often receive the most barbarous treatment, being beaten and otherwise ill used; but they are not allowed to leave them, whilst the husband, on the other hand, may divorce his wife upon any plausible pretence. Such is the condition of women by the laws of Hindustan, which, we have no reason to believe, are softened in domestic life. Certain it is, that women, as long as they are uneducated, will be in a degraded state. It is only when they cultivate their minds that they can mix with advantage in society, and that, respecting themselves, and respected by others, they can acquire that ascendency to which they are entitled, and give, by the delicacy of their manners, that tone and polish to society which it cannot receive from the other sex.

The ceremonial of marriage is conducted amongst the Hindus with great solemnity and expense. The parties, who are of equal rank, and any other alliance would be accounted infamous, are betrothed during their infancy by their parents, but on a full consideration of their respective rank, skilful genealogists being consulted previously on this important point. These preliminaries being settled, the transaction terminates with an elegant feast; and when the wife comes of age she is conducted to her husband's home, with all due ceremony, and a concluding entertainment; another set of observances take place when she becomes pregnant, when she passes her seventh month, and when she is safely delivered. These festivals amongst the rich are extremely expensive.

The Hindus are ignorant and illiterate. The children of the poor seem to be mostly uneducated. Those in a higher station are taught by the Brahmins to read and write, and to cast accounts, the calculations being performed by pebbles or small shells. The pupil first begins to write upon the sand with his finger, and he afterwards uses palm leaves. After being thus initiated in the rudiments of literature, he enters on the course of his professional study, in which he has no choice, every one following the profession of his father. A student is instructed chiefly in the Vedas, and in the ceremonial of his religion; and his course of discipline in the three Vedas may be continued for thirty-six years, in the house of his preceptor, or for a half or quarter of that time, until he comprehend them. To the state of the student succeeds that of the married man or the housekeeper, when the youth begins to sustain his part in the business of life. He may, however, continue his whole life a pupil, waiting upon and serving his preceptor the Brahmin until his death. By this devotion to him he acquires a title to the highest rewards of religion. Of the common people, a few individuals only are taught to read or write. The great body of the people remain in ignorance. They can explain nothing of their own religious system, nor of the ceremonies which they attend. This gross and universal ignorance, whilst it is the parent of crime, exposes the Hindus to all the artifices of priestcraft, and of every quack who pretends to skill in any art or science whatever. The unbounded influence of the priests is highly inexpedient, and has in some instances been found dangerous to the public peace. On one memorable occasion, as related by Bishop Heber, this influence became a political engine, which was wielded with great effect, to the alarm of the local government. Among other superstitions of the Hindus, it is well known that they inflict evils on themselves or others, even to the sacrifice of their lives, under the idea that they will be avenged on their enemies. One of these practices is to sit “ dhurna,” or mourning, in a fixed posture, without food, and exposed to the weather, until the person against whom the religious rite is directed agrees to give redress. It is firmly believed, that if the person dies in this mourning state, his avenging spirit will ever afterwards haunt and torment him whose obstinacy may have occasioned his death. The Hindus resort to this practice in order to enforce payment of a debt, or forgiveness of one; and it is a notion amongst them, that whilst an aggrieved person sits at their door “ dhurna,” they can neither eat nor undertake any business. Brahmins are even sometimes hired to sit *dhurna*, and their sacred character is supposed to give a peculiar awe to the ceremony. It was in opposition to an unpopular and heavy tax on houses in the city of Benares, against which they had in vain remonstrated, that the whole population, far and near, resolved to sit “ dhurna” till it was repealed. On this occasion the leading Brahmins took their measures with surprising concert and unanimity. Handbills were circulated explaining the causes and necessity of the measures, “ calling on all lovers of their country and national creed to join in it, and commanding, under many bitter curses, every person who received it to forward it to his next neighbour. Accordingly,” adds Bishop Heber, “ it flew over the country like the fiery cross in the Lady of the Lake; and, three days after it was issued, and before government was in the least apprised of the plan, above 300,000 persons, as it is said, deserted their houses, shut up their shops, suspended the labour of their farms, forbore to light fires or dress victuals, many of them even to eat, and sat down with folded arms and drooping heads, like so many sheep, on the plain which surrounds Benares.” There was every reason to dread some violent issue to such an extraordinary transaction. The local government, exceedingly perplexed by so strange and vast an assemblage, acted with consummate prudence; and this motley multitude being let alone, gradually dispersed. The rulers of India, thus admonished, were fain to repeal the obnoxious tax. The ignorance of the great body of the Hindus exposes them to impositions of every description. In the medical art, charms, incantations, exorcisms, and the shallowest tricks, are substituted for professional skill; and other impostors, generally Brahmins, practise astrology, and cheat them out of their money by pretended prophecies, from the aspect of the skies. The belief of sorcery and witchcraft is universally prevalent amongst them, and leads, as it formerly did in our own country, to cruel enormities. Persons suspected of witchcraft are the objects of fear and hatred; and their neighbours often assume the right of trying them for this crime, by charms and incantations, such as planting a branch of the saul tree in water, with the name of the suspected person, and if it wither within a certain time, the accused is condemned to death as a witch.

[2] Rickards' *India*, p. 3.

[3] Tennant, *Indian Recreations*.

The Hindu is distinguished by the slenderness and delicacy of his corporeal frame, which is partly the cause of his peculiar timidity. His make, his physiognomy, and his small degree of muscular strength, convey a remarkable idea of effeminacy, especially when contrasted with the robust stature of a European who is making the observation. “ The sailor,” says Orme, “ no sooner lands on the coast, than nature dictates to him the full result of this comparison. He brandishes his stick in sport, and puts fifty Indians to flight in a moment.” The Indian, however, greatly surpasses the European in the sensibility of his touch, and in the flexibility of his limbs; and hence, with tools which would scarcely enable the clumsy fingers of the one to make a piece of canvass, he weaves the finest cambrics; and in all feats and contortions of the body, in the art of tumbling, and in juggling tricks, the Hindus excel all other nations. They are also patient of bodily fatigue, and in running or marching will distance more robust competitors. An Indian messenger will travel on foot fifty miles a day for twenty or thirty days without intermission. They are withal remarkable for bodily inertness, and the love of repose. “ It is more happy,” they say, “ to be seated than to walk; it is more happy to sleep than to be awake; but the happiest of all is death.” Their amusements are accordingly all of the sedentary kind. A game which resembles chess and draughts, though without either the variety or interest of the former, is one of their favourite amusements; and, like all rude nations, they are passionately fond of gaming, though it is contrary to the Gentoo code; also of feats of agility and legerdemain; and a juggler who erects a stage in any part of the East is sure to draw a crowd of spectators. Buffoonery, story-telling, music, consisting of simple melodies, and dancing, which they enjoy as spectators, complete the catalogue of Hindu amusements. Their extreme fondness for hunting forms an exception to their general indolence; all the different races in India, Europeans, Moguls, and Hindus, shaking off their natural supineness, are seen to concur in the ardour of the chase. Hawking is also keenly pursued by natives of distinction. Besides falconers, fowlers, and game-keepers, Hindus of rank employ persons to ensnare wild animals; and the contrivances they resort to are not less ingenious than successful.

Many have given credit to the Hindus for cleanly habits, from their frequent ablutions; but the reverse is the case. A taste for cleanliness is a proof of refinement; it is a sure mark of a highly civilized people; and accordingly it is not to be found in any part of Asia. Almost all the Asiatic cities are distinguished by narrow streets, into which, as there are no police regulations, all sorts of filth are indiscriminately thrown. The Hindus form no exception to this general censure. In all the great towns the streets are filthy. Nor are the Hindus more cleanly in their persons. Their linen, being dyed, is seldom washed; and, like the Chinese, they frequently allow their robes to drop off with filth before they think of changing them.

Government.

A simple and despotic monarchy is the only form of government which was established under the native princes of Hindustan; and it was a despotism in the true Asiatic sense of the word, under which neither laws nor manners restrained the excesses of absolute power. In the most despotic states of Europe, the authority of the monarch is controlled by the influence of manners, and life and property are perfectly secure. But this was far from being the case in India; the sovereign was supreme arbiter of the lives and properties of all his subjects. Nor was this power allowed to lie dormant; it was frequently enforced in cruel and arbitrary acts; and the annals of India are accordingly stained with the most revolting outrages of abused power. Wealth presented too tempting a prize to lawless violence; and its possessor, if he neglected to make large and seasonable presents, was sure to be accused of some pretended crime, thrown into a dungeon, and plundered. "Instead of giving him poison," says Orme, in his just estimate of the people and government of Hindustan, "which would not answer the end proposed, as his treasures are buried, he is beset with spies, who watch his minutest actions, and probably propose to him a commerce with the enemies of the province. If he avoid these snares, a profitable post in the government is proposed to him, which, if he accepts, his ruin is at hand, as the slightest of the villanies practised in every branch of it affords grounds for making him a public criminal. Should he have escaped this too, it remains that some more glaring and desperate measure of iniquitous justice hurry him to destruction." Mr Orme then proceeds to mention the case of a wealthy banking-house, the partners of which were personally known to him, who, having dexterously avoided all the snares laid for their property and life, were at length involved in an accusation by the accident of one of the dead bodies which are continually floating on the Ganges being thrown ashore under the walls of their house, on which it was surrounded by the officers of the civil magistrate, who dragged them to prison as the murderers of a son of Mahommed, and having ordered them to be severely scourged, extorted from them as the price of their liberty a present of 50,000 rupees. Another wealthy individual was forced to give in one present, to the nabob of Bengal, a sum equal to three hundred thousand pounds sterling.[1] Bishop Heber relates of the Rannee, or princess of Jeepoor, that she murdered a female attendant, a woman of character, and possessed of considerable wealth, who was believed, until that time, to stand high in her mistress's confidence. Eight other women of the Zenana believed themselves marked out for destruction. Another princess, who possessed a jaghire or landed estate near Meerut, frequently ordered the ears or noses of her attendants to be cut off for slight offences; and one of her dancing girls was imprisoned under ground, and starved to death, she herself keeping watch until she heard the last faint moans of her expiring victim.[2] Such enormities present a dreadful picture of Indian despotism, and fully bear out Mr Orme in his contrast between the manners of Europe under the influence of Christianity, and those of Hindustan, under which poisonings, treachery, and assassinations, are daily committed by the votaries of ambition, as are rapines, cruelty, and extortions, by the ministers of justice.

From the great extent of the Mogul empire, the influence of the supreme power was but feebly felt in its distant parts, and the kingdom was accordingly divided into distinct provinces, in which deputies or viceroys, called nabobs, ruled with delegated power. Those provinces were again subdivided into districts, which were committed to the subordinate administration of rajahs. These districts might consist of one town and its territory, or of a thousand towns; and hence the Hindu system of provincial government comprehended different degrees of princely dignity and dominion, according to the extent and value of the lands that were assigned. But all these various rulers, though each was amenable to the one above him, exercised supreme and despotic sway within their own districts. There was also a particular rank of princes called subahs, who ruled in the extremities of the kingdom, in which the rigour of the supreme authority was weakened by distance, with higher rank and greater powers than the rajahs. The Deccan was under the administration of a subah, as was also the extensive and distant province of Bengal. The absolute power of the Great Mogul descended without any loss of vigour to all its inferior delegates; and in this manner the whole of the country groaned under the dominion of numerous tyrants. From this extensive delegation of the superior power, it happened, that on the decay of the Mogul empire, the provincial rulers gradually acquired independence, and, in their warfare with each other for dominion, filled the country with rapine and bloodshed. "Hindustan," says Major Rennell, "even under the Moguls, may be considered as a collection of tributary kingdoms, each accustomed to look no farther than its own particular viceroy, and of course ever in a state to rebel, when the imbecility of the emperor, and the ambition of the viceroy, formed a favourable conjuncture;" and accordingly he observes that "rebellions, massacres, and barbarous conquests, make up the history of this fair country, which, to an ordinary observer, seems destined to be the paradise of the world."[3] And to the same purpose Orme remarks: "If the subjects of a despotic power are everywhere miserable, the miseries of the people of Hindustan are multiplied by the incapacity of the power to control the vast extent of its dominion; and thus," he adds, "the contumacy of vicegerents resisting their sovereigns, or battling among themselves, is continually productive of such scenes of bloodshed, and of such deplorable devastations, as no other nation in the universe is subject to."[4]

In the Mogul sovereign was vested the whole administration of the state, the executive as well as the legislative and judicial powers. In his executive duties the law assigned him a council of state, the functions of which generally devolved on some favourite minister. His legislative duties were simple, seeing that religion was the law, and that the sacred ordinances constituted the judicial code, which it would be impiety to alter. The Brahmins being the sole interpreters of the holy books, acted as assessors to the nabob or rajah, or his delegates in the judicial office. The mode of administering justice had an appearance of openness and fairness, and the forms of the court were extremely simple. The seat of justice was exposed in a large area, capable of containing the multitude; and here justice was administered by the duan or judge, in the absence of the nabob; the plaintiff having attracted attention by his importunate clamours, was ordered to be silent, and to advance before the judge, to whom, after having prostrated himself, he told his story in the plainest manner. He visited the judge in private, gave the jar of oil, and his adversary bestowed the hog, which broke it; the friends who had influence interceded, but it was the largest bribe that ultimately gained the cause. The forms of justice were no doubt preserved; witnesses were heard, but browbeaten, and removed if their evidence did not please the judge. "Proofs of writing," says Orme, "are produced; but deemed forgeries and rejected, until the way is cleared for a decision, which becomes totally or partially favourable, in proportion to the methods which have been used to render it such; but still with some attention to the consequences of a judgment which would be of too flagrant iniquity not to produce universal detestation and resentment." In Hindustan, accordingly, the judicial tribunals afforded no refuge to the oppressed; they were rather instruments of tyranny, by which the unhappy people were plundered under the forms of law. Avarice is the reigning vice of Hindustan, and power is used by all public functionaries as the means of its gratification. The havildar, the head of a village, calls his habitation the durbar, and plunders of their meal and roots the wretches within his jurisdiction; the zemindar fleeces him of the small pittance of silver which his penurious tyranny has scraped together; the phoosdar, or military commandant of the province, seizes on the zemindar's collections, and bribes the nabob's connivance in his villanies by a share of the spoil; the covetous eye of the nabob ranges over his dominions for prey, and employs the plunder of his subjects in bribing or in resisting his superiors. "Subject to such oppressions," says Orme, "property in Hindustan is seldom seen to descend to the third generation." Many suits are, however, decided amongst the Hindus with equal accuracy and despatch, by arbitration of friends, the heads of castes, or the chief inhabitants of the village.

This important subject will perhaps be more properly considered when we come to treat of the political transactions of the British in India, and of their administration of the revenues of the Mogul empire. In the mean time it may be observed, that those revenues chiefly arose from a tax on the land, imposed by the sovereign, or from a share in its produce, which, according to some, he received as proprietor of the soil. The tax was immediately paid into the imperial treasury by the zemindar, who collected it from a variety of under tenants, holding by peculiar tenures, which will be afterwards more particularly considered. The proportion of the crop claimed by the government varied, according to the fertility of the land, from a sixth to a twelfth part; and being ascertained by the proper officers, it was either paid in kind or in money. Custom-duties were levied on imports by sea, and by land on the transit of goods at the different toll-bars in the country. These were sometimes farmed out by the local authorities. Other taxes are enumerated in the sacred books, on mercantile profits, on which was levied a fiftieth, or even a twentieth part; on the accumulation of property in gold, silver, precious stones, cattle; on the purchases and sales of merchants; and on mechanics and serving-men, who were liable for a contribution of labour at the rate of a day in each month. A trifling poll-tax was imposed on the meaner inhabitants. Exclusive rights of manufacture, and trade in certain articles, such as salt, arrack, betel-nut, and tobacco, were also granted to the inhabitants for an annual payment.[1] The Hindu rulers, however ignorant in other matters, thus appear to have been familiar with all the most approved modes of plundering their subjects; and these failing, they had recourse to open violence. It is mentioned by Mr Rickards, whose views of Indian manners seem to be equally judicious and accurate, that those revenue systems of India never were, "because they never could be, literally enforced, the real practice being to exact and plunder, without any fixed rules, all that could be squeezed out of defenceless subjects." After enumerating the various revenue officers who acted under the sovereign, such as nabobs, dewars, foujedars, amildars, tchsildars, jaghiredars, zemindars, polygars, talookdars, rajahs, naiks, wadeyars, &c., he adds, "swarms of harpies were thus spread in every direction, even to the mundils and potails of villages; and despotism established, as it were, in detail, in every corner of the land. Power was here a license to plunder and oppress. The rod of the oppressor was literally omnipresent; neither persons nor property were secure against its persevering and vexatious intrusions. The common transactions of life became objects of punishment or extortion. And no other principles being known or dreamt of in India than arbitrary power on the one hand, and abject submission on the other, a state of society was fixed and rooted in the manners, the poverty, and the ignorance of the people, of which no parallel nor resemblance is anywhere to be found in European states."[2]

Hindu laws.

The laws of the Hindus which apply to property, and which regulate sales or purchases, loans, transfers, and deposits of goods, though they are founded on the principles of justice, are frequently rude, loosely expressed, and such as, along with a corrupt judicature, must leave every thing to the discretion of the judge. The law fixes the price of commodities, regulates the interest on money, and on the loan of goods, such as grain, fruit, &c.; and, by a peculiar injustice, imposes a greater interest on the servile castes than on the Brahmins and soldiers. The modes of enforcing debts are the same as in all other countries. The creditor may seize upon the property or person of his debtor, whom he may beat or otherwise maltreat, and, if he be of an inferior caste, compel to labour for his profit. He may even confine his wife or children. Another mode of enforcing payment is by sitting dhurna, a ceremony already explained. The laws of inheritance form an important branch of the Hindu code, though it is justly remarked,[3] that "the slavery to which the rights of parent and husband subject the female, abolishes at once all suits of dowries, divorces, jointures, and settlements." On the death of the father, his property is divided amongst his children, who frequently live together, with the elder brother as their head. If they separate, the eldest receives one twentieth more than the others. Science and good conduct are mentioned as grounds of preference, as vice of exclusion; and thus is laid the foundation of endless disputes. In some cases the gross and cruel superstition of the Hindus subverts the principles of justice; the blind, the deaf, the dumb, or those affected with leprosy, or any other incurable disease, being deprived of their share in the paternal inheritance. Children of different castes inherit according to the rank of the mother, and those of concubines receive only half the share of legitimate children. All property in Hindustan is regulated by law, the Hindus having no idea of devising by rule; nor are any members of the family at liberty to alienate, except in certain particular cases, any part of the common stock.

The criminal code of the Hindus is distinguished, like that of all rude nations, by severity; and also by caprice and partiality. The offences of the low-born tribes against the higher receive a full measure of vengeance, whilst the latter are but slightly punished for the injuries which they inflict on their inferiors. It is enacted, that if a Sudra strike a Brahmin with hand or foot, the offending member shall be cut off; if he insult him with his tongue, it shall be slit, or a red-hot iron shall be thrust into his mouth. Murder is punished with death, theft with fine, and the more heinous cases with various degrees of mutilation, with impaling, burning alive, and crucifixion. The multifarious cases of offence which are detailed in the Hindu code, such as throwing ordure, or the refuse of victuals, on another, spitting upon him, &c., are many of them insignificant, and scarcely merit the minute enumeration which is given. The illicit intercourse of the sexes is a complicated subject, into the details of which it is unnecessary to enter. It seems principally directed against the want of chastity in women, which is punished as the most shocking of crimes, by burning on a heated plate of iron; or against the lower tribes, in whom adultery with a Brahmin woman is considered as the climax of human depravity, scarcely to be avenged by any punishment, however dreadful. On the other hand, crimes committed by the higher classes against the lower are very slightly punished; the scale of punishment being in all cases graduated in an inverse ratio to the rank of the offenders.

Architecture.

In architecture, in the fine arts, in painting and music, the Hindus are greatly inferior to the Europeans. The pagodas, the tombs, and other structures, the only remaining specimens of their architecture, are, according to some, more remarkable for the magnitude of their dimensions than for their just proportions or fine taste. "The columns and pillars," says Tennant, "which adorn their immense pagodas, are destitute of any fixed proportions; and the edifices themselves are subjected to no rules of architecture." He afterwards adds, that the celebrated mausoleum at Agra has little to boast of either in simplicity or elegance of design. "The immensity of its size, its costly ornaments, and the minute exactness of its decorations in particular parts, are worthy of notice; but they afford much stronger proofs of the wealth and magnificence of Shah Jehan, than the correctness of its taste." The tombs and religious edifices of Hindustan are, on the other hand, highly commended by Bishop Heber for delicacy, beauty, and taste. The mausoleum at Agra he celebrates as the most splendid building, in its way, that he had seen in India.[1] Humaion's tomb at Delhi he also praises as a noble building of granite, inlaid with marble, and in a very chaste and simple style of Gothic architecture; and of the imanbara or cathedral at Lucknow he remarks, "The whole is in a very noble style of eastern Gothic, and, when taken in conjunction with the Roumi Durwazu which adjoins it, I have never seen an architectural view which pleased me more, from its richness and variety, as well as the proportions and general good taste of its principal features."[2] There seems no doubt, from the splendid structures that are still found in different parts of Hindustan, that architecture and the kindred arts had flourished amongst the Hindus of a remoter age; though it is mentioned by Colonel Todd, that very few good specimens of the art have been executed within the last 700 years. His description, however, of the splendid Jain temples at Ajmeer and other parts, some of them erected long prior to the Christian era, and distinguished alike by chasteness and beauty of design, and by rich and exquisite finishing, must convince the most incredulous, that in these remote times the arts had made great progress in Hindustan. These structures are not merely monuments of labour, but of taste; they evince the perfection of art; and in symmetry, beauty of proportion, unity of design, and splendid ornament, they rival the noblest productions of classical Europe. The history of the people who have raised these structures presents a wide field for antiquarian research, on which Colonel Todd has entered with the brilliant promise of interesting results; and to his learned inquiries and eloquent and poetical descriptions we refer for a further account of those ancient monuments of Hindu art.[3]

Paintin

Of the Hindu paintings the chief merit is brilliancy of colour, rather than taste in the design or liveliness of expression. They imitate most exactly, and are excellent draughtsmen; and they draw specimens of natural history with much neatness and accuracy. "The laborious exactness with which they imitate every feather of a bird," says Tennant, "or the smallest fibre on the leaf of a plant, renders them valuable assistants in this department; but farther than this they cannot advance one step. If your bird is to be placed on a rock or upon the branch of a tree, the draughtsman is at a stand; the object is not before him, and he can't supply nothing.[4] Since this period, however, the Hindus have made great advances in the art of painting; and some of their portraits display taste and expression that would not discredit European artists.

Music.

The music of the Hindus is rude and inharmonious. They have numerous instruments, but those are preferred which make most noise; the beating of the great drum is reckoned an emblem of sovereign power.

Literat

The literature of the Hindus has been generally rated very low by European writers, and has been represented as consisting in long desultory poems, inflated and extravagant in their style, containing, under the idea of a history, a tissue of absurd fables, interspersed with passages or episodes that are tender and passionate, and possess all the sweetness of pastoral poetry. They are said to be totally destitute of historical annals, and their geography is a mass of errors. Nor has their astronomy those claims to antiquity which were at first allowed. Accurate inquiry has proved this science to be in its infancy amongst them.[5] The want of historical records by the Hindus is strongly denied by Colonel Todd, who has himself composed a history of the Rajpoots from native works, which he found in the libraries of their princes, and he asserts that in those depositories of Hindu literature many more works exist, which would reward the researches of the learned. "The works of the native bards," he observes, "afford many valuable data in facts, incidents, religious opinions, and traits of manners." "In the heroic history of Pirthi-raj, by Chund," he adds, "there occur many geographical as well as historical details, in the description of his sovereign's wars, of which the bard was an eye-witness, having been his friend, his herald, his ambassador, and finally discharging the melancholy office of accessory to his death, that he might save him from dishonour." The Brahminical accounts of the endowments of temples, of their dilapidation and repairs, supply historical and chronological details; also the legends respecting places of pilgrimage and religious resort. Much historical information lies hid in the controversial records of the Jains; and, says Colonel Todd, "those different records, works of mixed historical and geographical character, which I know to exist, *rasahs* or poetical legends of princes, which are common, local *puranas*, religious comments and traditionary couplets, with authorities of less dubious character, namely, inscriptions cut on rocks, coins, copperplate grants, containing charters of immunities, and expressing many singular features of civil government, constitute, as I have already observed, no despicable materials for the historian." Colonel Todd is of opinion that the ancient records of the Hindus are more complete than the early annals of the European states.

---

[1] The following is his description of this monument of Hindu art:—"It stands in a square area of about forty English acres, enclosed by an embattled wall, with octagonal towers at the angles, surmounted by open pavilions, and four very noble gateways of red granite, the principal of which is inlaid with white marble, and has four high marble minarets. The space within is planted with trees, and divided into green alleys, leading to the central building, which is a sort of solid pyramid, surrounded externally with cloisters, galleries, and domes, diminishing gradually in ascending it, till it ends in a square platform of white marble, surrounded by most elaborate lattice-work of the same material, in the centre of which is a small altar tomb, also of white marble, carved with a delicacy and beauty which do full justice to the material, and to the graceful forms of Arabic characters, which form the chief ornament."

story.

Prior to Alexander's expedition into India, which took place 327 years before the Christian era, the Greeks appear to have known little of these eastern countries, except from the confused accounts of travellers; and nothing whatever of the countries beyond the sandy desert of the Indus, which, with its tributary streams, was the limit of Alexander's progress eastward. The men of science who accompanied this warlike prince brought to Europe full and accurate accounts of the countries which he had conquered; and the spirit of inquiry, now awakened amongst the Greeks, was still further gratified by the ample accounts of Megasthenes, the ambassador sent to India by Seleucus, and who resided long at Palibothra, the capital of the Prasii, near the mouth of the Ganges. The Greek writers, drawing their information from those sources, describe the leading features of Indian society and manners, and with an accuracy which stamps authenticity on their narratives. It is unnecessary to dwell upon the particulars of Alexander's expedition, which are fully described in many other works; and from that until the period of the Mahommedan conquest, when the native records commence, there is nearly a complete chasm in the annals of Hindustan. The Hindus had either no records, or these had been destroyed during the intestine commotions which have always prevailed in India. The historical poem, the Mahabarat, is a tissue of extravagant fables. Ferishta's history, written early in the seventeenth century, is supposed to have been collected from Persian authors; and the most valuable part of it begins after the commencement of the Mahommedan conquests. It was about the year 1000 that Hindustan, formerly ruled by a pure Hindu monarchy, fell under the sway of the Mahommedan conquerors, who subdued all the provinces west of the Ganges, and formed them into one great empire. On the fall of this empire, India became one scene of commotion and war, and her finest provinces were laid waste. It was then that the Mahratta empire arose, like a meteor in the political sky, blazing for a while, and soon fading into obscurity; and by its fall paving the way for the ascendency of the British, whose powerful sway now extends from the Himalaya Mountains to Cape Comorin. We shall endeavour to sketch the leading and most eventful scenes of that political drama, which has thus terminated in the subjection of all India to one great ruling power.

quest
the
hom-
lans.

The Mahommedan powers having subdued Persia and the neighbouring countries, made occasional inroads into India; and, about A. D. 1000, Mahmoud entered Hindustan, in which he effected a permanent establishment. This prince was the grandson of Subuctagi, the ruler of Ghizni, consisting of the tract which composed the kingdom of Bactria after the division of Alexander's empire, namely, the countries lying between Parthia and the Indus, and south of the Oxus. He invaded India twelve several times, massacring in his intolerant rage the Hindus as infidels, and defacing and destroying their temples. "Nothing," observes Major Rennell, with his usual force, "offends our feelings more than the progress of destruction, urged on by religious zeal, as it allows men to suppose themselves agents of the divinity, thereby removing those checks which interfere with the perpetration of ordinary villany, and thus makes conscience a party where she was meant to be a judge." The last invasion of India by Mahmoud was in 1024, and in four years afterwards he died. His dominions comprehended the eastern provinces of Persia, nominally all the Indian provinces westward of the Ganges, to the peninsula of Gujerat, and from the Indus to the mountains of Ajmere.

The Punjab, or the tract watered by the Indus, and its five tributary rivers, was all that was subjected to the regular government of the Mahommedans. The rajpoots of Ajmere defended their rugged mountains and close valleys with obstinate valour. The Ghiznian empire was in the year 1158 divided into two; the western portion being seized on by the family of the Gaurides (so denominated from Gaur or Ghir, a province or city lying beyond the Indian Caucasus), whilst the countries on the Indus were possessed by Chusero or Cusroe, who fixed the seat of his empire at Lahore. The Mahommedans now extended their conquests eastward; and Mahommed Gori, in 1194, took the city of Benares, which he abandoned to pillage. He carried his arms to the south of the river Jumna, and took the fortress of Gualior; he also reduced the eastern frontier of Ajmere. He was succeeded in 1205 by Cuttub, who fixed his capital at Delhi, and founded in Hindustan the dynasty of the Patans or the Afghans, who inhabited the mountainous tract situated between India and Persia. The Emperor Altmush succeeded him in 1210, and extended his conquests over Bengal. In his reign the renowned Ghenghiz Khan subdued the western empire of Ghizni; and the Moguls, or the Monguls, his successors, about the year 1242, made frequent irruptions into the north-western provinces of Hindustan. The country was in the mean time a scene of intestine commotion, from the contests of rebellious chiefs aspiring to supreme authority, and from the irruptions of the predatory hill tribes into the plains below. In 1265, about 100,000 of these plunderers were put to the sword, and a line of forts constructed along the foot of the hills. In the mean time, the Patan monarchs of Delhi were prosecuting their conquests eastward, and the Moguls were making incursions into the western provinces; and a considerable number of them under Ferose II. were at length permitted to settle in the country in the year 1292. In 1293 this emperor invaded the Deccan, or the country lying to the south of the Nerbuddah and the Cuttuck rivers. He was deposed and murdered by Alla, the governor of Gurrah, who advised the expedition, and who extended his conquests in the Deccan. Cafoor, one of his generals, penetrated into the Carnatic, or the peninsula lying to the south of the Kistna river, in 1310. Rebellions breaking out in Tellingana, a principality in the Deccan, it was again subjugated in 1322 and in 1326, in which year Alla died, and the Carnatic was ravaged from sea to sea. Under a succeeding emperor, Mahommed III., the Mahommedans were driven from the Deccan and Bengal, and lost much territory in Gujerat and the Punjab. Ferose III., who succeeded, was more intent on domestic improvement, and in constructing canals, than on foreign conquest. He died in 1388, and Mahmoud III. succeeded, during whose minority great confusion ensued; and in 1398 the country was invaded by Tamerlane, who advanced to Delhi, which submitted without a struggle, and was abandoned to the fury of the soldiery, who continued for several days to massacre the defenceless inhabitants. The military irruption of Tamerlane into Hindustan was more for the sake of plunder than of conquest, though it added to the existing anarchy of the country. In 1413 Mahmoud died, and with him ended the Patan dynasty, founded by Cuttub in 1205. A period of great confusion followed, and numerous competitors contended for dominion. This state of anarchy, which came to a height under Ibrahim II. in 1516, paved the way for the conquest of Hindustan by Sultan Baber, a descendant of Tamerlane and of Ghenghiz Khan, who reigned over a kingdom composed generally of the provinces situated between the Indus and Samercand. Being dispossessed of the northern portion of his dominions by the Usbecks, he invaded India, and in 1525 defeated the emperor of Delhi, and conquered the north-eastern provinces of India. He was succeeded, after

Reign of Acbar;

of Aurungzebe.

a reign of five years, by his son Humaioon, who was driven from his throne by the rebellion of Sheer Khan, whose successful usurpation was succeeded by such a period of disorder, five sovereigns having appeared on the throne in the course of nine years, that Humaioon was recalled in 1554, and died the following year, leaving his son, the celebrated Acbar, only fourteen years of age, the heir to the throne. His was a long and glorious reign of fifty-one years, in which the revolted provinces were reduced from Ajmere to Bengal, and consolidated into one empire by the unlimited toleration of the Hindus and all others, and generally by a just and wise policy. In 1585 and the subsequent years he invaded the Deccan, which, by the dissolution of the Bahmenee empire, was divided among the sovereigns of Bejapoor, Ahmednagur, and Golconda, whilst another army was reducing the country of Cashmere in an opposite direction. At the time of Acbar's death in 1605, he had possession of the western part of Berar, Candeish, Telhyana, a division of Golconda, and the northern part of Ahmednagur, the capital of which was taken in 1601, after a long and bloody siege, and an unsuccessful attempt to relieve the place by the confederated princes of the Deccan.[1] Acbar died in 1605, at which time his empire was divided into fifteen viceroyalties, called subahs; namely, Allahabad, Agra, Oude, Ajmere, Gujerat, Bahar, Bengal, Delhi, Cabul, Lahore, Moultan, Malwah, Berar, Candeish, and Ahmednagur. He was succeeded by his son Selim, under the title of Jehanguire. It was in his reign, in 1615, that Sir Thomas Roe, the first English ambassador, was sent to the Mogul emperor of Hindustan; and the Portuguese had by this time acquired considerable settlements in Bengal and Gujerat. Shah Jehan, who disturbed his father's reign by constant rebellions, succeeded to the throne in 1627, and pursued his conquests in the Deccan with renewed vigour, filling the country with plunder and devastation. It was in this reign, in the year 1633, that the first serious quarrel took place between the Portuguese and the Moguls, when the former were expelled from Hooghly in the Ganges. In 1658 the country was again distracted by the civil wars of the emperor and his sons, and of the sons amongst themselves contending for dominion. Shah Jehan died on the 21st of January 1666, after being seven years confined in the castle of Agra. The Mogul empire at his death extended from Cabul to the Nerbuddah, westward of this river to the Indus, and eastward it comprehended Bengal and Orissa; and to the south the Moguls had reduced a large tract of country bounded by Berar on the east, westward by the hills towards Concan, and by the dominions of Golconda and Viziapore to the south. These convulsions, by which India was at this time distracted, ended in the elevation to the throne of the renowned Aurungzebe, the youngest son of Shah Jehan, whom he had deposed; he had also murdered or expelled his three brothers. In 1660, Aurungzebe, who took the title of Allumgere, or Conqueror of the World, was firmly seated on the throne; and from that period until the year 1678, Hindustan enjoyed more profound peace than it had ever before known. In the mean time Aurungzebe invaded the Deccan, which during the latter part of his reign was, with the exception of a few mountainous tracts, subdued by his victorious arms, and rendered tributary to the ruler of Delhi. He was afterwards engaged, in 1678, in quelling the rebellion of the Patans beyond the Indus, and the Rajpoot tribes, by whom he was hemmed in amongst the mountains, and narrowly escaped. He again invaded the country in 1681, and took and destroyed Cheitore, the capital, and all the objects of Hindu worship found there. The obstinate resistance of these gallant mountaineers at last extorted peace from the mighty monarch of the Mogul empire.

Prog s of th Mah tas.

But Aurungzebe had now to contend with another enemy for the dominion of India. In the south the Mahratta power was fast rising into importance. Sevajee, the founder of this new state, was a military chief, the illegitimate son of the rana of Odeypoor, the chief of the Rajpoot princes. In his youth he resided at Poonah, on a zemindary estate obtained by his father. Here he collected around him a numerous banditti, and plundered the country. The number of his followers gradually increasing, he extended his ravages still farther into the dominions of Viziapore, and acquired an immense booty, which enabled him to increase his force, and openly to resist the troops of Aurungzebe which were sent against him. He expired in his fortress of Raynee, of an inflammation in the chest, at the age of fifty-two, on the 5th of April 1682. His whole reign was one continued scene of war and political intrigue, in which he displayed the talents of a consummate general and an able and crafty statesman. "He met," says Orme, "every emergency of peril, however sudden and extreme, with instant discernment and unshaken fortitude; the ablest of his officers acquiesced in the eminent superiority of his genius, and the boast of the soldier was to have seen Sevajee charging sword in hand."[2] At his death, his empire, with the exception of the small territory of Goa on the south, Bombay, Salsette, and an inconsiderable tract on the north, comprised a tract of country about 400 miles in length and 120 in breadth. He was besides in possession at one time, towards the Eastern Sea, of half the Carnatic. By his own talents he had thus acquired a permanent sovereignty, "established," says Orme, "on a communion of manners, customs, observances, language, and religion, united in common defence against the tyranny of foreign conquerors, from whom they had recovered the land of their own inheritance." Sevajee was succeeded by his son Sambajee, who was afterwards betrayed into the hands of Aurungzebe, and barbarously put to death. Aurungzebe died in 1707, in the ninetieth, or, according to some, the ninety-fourth year of his age, at Ahmednagur, in the Deccan, in the subjugation of which he had been engaged from the year 1678 until his death. He was for the most part engaged in the field during the last fifteen years of his life. Whilst he was absent in the Deccan, the peace of the empire was disturbed by insurrections of the Rajpoots in Upper India, and of the Jauts, now for the first time known in any other character than that of banditti.[3] Under his reign the Mogul empire attained to its height. His dominions extended from the tenth to the thirty-fifth degree of latitude, with nearly as many degrees of longitude; and his annual revenue was equal to thirty-two millions sterling.

Inte al diso rs.

After the death of Aurungzebe, the sovereignty of the empire was disputed by his four sons, Munzum, Azem, and Kaum Buksh, who severally contended with their elder brother, and Acbar, who thirty years before had been engaged in rebellion, and fled to Persia. Munzum and Azem met in the field with armies of 300,000 men on each side, when the latter was defeated and slain, and Munzum ascended the throne under the title of Bahader Shah. He reigned five years, and the empire had been so distracted by civil wars and anarchy, that it required all his exertions to restore order. He was soon after his accession called into the Deccan by a rebellion of his brother Kaum Buksh, which was quelled by his death. He now turned his arms against the Rajpoots and the Sikhs, who for the first time appeared in arms in the province of Lahore. These insurgents he reduced after much trouble and delay; and he took up his residence at Lahore, where he died in 1712, after a short illness, having never during his reign visited either Agra, or Delhi his capital. He left four sons, who immediately commenced a contest for the throne. Azem Ooshawn, who took possession of the treasures, was killed in a battle with his other brothers. Jehan Shah, the youngest, next lost his life in a battle with Jehamder Shah, who was the eldest, and who successfully disputed the possession of the throne with the remaining brother. At the end of nine months, however, he was dethroned by Feroksere, a son of Azem Ooshawn, and great grandson of Aurungzebe, who was elevated to the throne by the influence of two brothers, Abdoola Khan and Hussun Khan, Seids by birth, or descendants of the prophet, whose talents had raised them to reputation and power. It was in this reign that the English East India Company obtained their famous firman or grant, by which they were exempted from all custom duties on the export and import of their goods. This was considered as the commercial charter of the Company as long as they required protection for their trade. In 1717 Feroksere was deposed and blinded by the two Seids, Hussun and Abdoola, to whom he owed his elevation to the throne. In his place they chose Ruffieh-ul-Dowlat, a son of Bahader Shah; and in less than a year deposed and put him to death. His brother, who by their means was also made king, met with the same treatment; so that in the course of eleven years from the death of Aurungzebe, four princes of his line had ascended the throne, whilst six others had met the usual fate of unsuccessful aspirants to that dignity. Mahommed Shah, the grandson of Bahader Shah, was placed on the throne by the Seids in 1718, from whose influence he contrived at length to free himself, though not without a rebellion and a battle, in which they were both slain. In the mean time Mahommed Shah was deficient in the vigour which his difficult situation required, and the provincial governors at a distance began to show symptoms of independence. Nizam-ul-Muluck, the viceroy of the Deccan, was the most formidable of those pretenders to sovereignty. He had reduced the province of Gujerat and Malwah; and having paid a visit to the imperial court, and observed the dissolute administration of affairs, he quitted the capital in disgust, under pretence of a hunting excursion, for his government of the Deccan. He was deprived of the administration of Gujerat and Malwah, the two provinces which he had acquired. In revenge he encouraged the rulers of these provinces to resist the imperial authority; whilst at his instigation also the Mahrattas invaded the country, and after a severe struggle succeeded, about the year 1732, in completely reducing this long-disputed territory.

asion
adir
h.

But a more dreadful calamity was now impending over the distracted empire. The sceptre of Persia had been long swayed by a feeble race of monarchs, and the country became an easy prey to the hardy mountaineers of Afghanistan, who in 1722 laid siege to Ispahan, when the feeble Hussun Shah surrendered the crown to the invader. He had a son Thamas, however, who escaped from the general massacre which ensued, and who was joined by many partisans, amongst others by Nadir, the son of a shepherd of Khorassan, who, with his band of followers, soon distinguished himself as a brave and active supporter of the fallen prince. In 1729 he retook Ispahan, and finally, by his talents, raised himself to the throne of Persia in 1736, having put out the eyes of the unfortunate son of the late monarch. Being afterwards engaged in an expedition against the Afghans, he advanced to the frontier of Hindustan, but without any ulterior views of hostility, when a messenger and his escort, whom he had despatched to the emperor at Delhi, were murdered at Jellalabad by the inhabitants; an outrage which being approved by Mahommed Shah, Nadir prepared for revenge. He gave up the offending city to be pillaged by his soldiers; and advancing to Delhi, was met by the imperial troops, who were totally defeated. The views of the conqueror, however, were not hostile, and two crores of rupees would have purchased his retreat from Hindustan. But this amicable arrangement was frustrated by a dispute between Saadut Khan, subahdar of Oude, and the nizam of the Deccan, for the vacant office of Ameer-ul-Omrah, formerly paymaster of the forces. Saadut Khan, the disappointed candidate, persuaded Nadir Shah that the proffered sum was no adequate ransom for Hindustan; on which Nadir advanced to the capital, which opened its gates to receive him; and for two days thereafter the Persian troops observed the most exact discipline. But in the course of the night a rumour was spread that Nadir was killed, on which the inhabitants rose against their invaders, and massacred many of them. Nadir took severe and immediate revenge. He dispersed his irritated soldiers throughout every quarter of the city, with orders to spare neither age nor sex; and in this indiscriminate slaughter 100,000 persons are said to have perished, whilst the city was set on fire in several places. The imperial treasure was plundered; plate, jewels, and specie, were carried off to the incredible amount of thirty-two millions sterling. Rich bankers and others were forced by torture to disclose their hidden wealth, and a heavy contribution of thirty millions was imposed on the city by the relentless conqueror. Nadir Shah departed from Delhi, of which he had held possession thirty-seven days, in the year 1739; and the nizam still retained possession of the whole power of the empire, which he sacrificed to his own views in the Deccan, where he established an independent kingdom. Nadir Shah died in 1747. In the subsequent confusion, the eastern provinces of Persia, and those bordering on India, were formed by Abdalli, one of his generals, into an independent state, which comprised the ancient empire of Ghizni, and was known under the name of the kingdom of the Abdalli. Mahommed Shah died the same year, after a reign of twenty-nine years. Every day disclosed the growing weakness of the empire, and strong symptoms of its early and entire dissolution. In 1738 Bengal became independent under Aliverdy Khan, and it was soon afterwards invaded by a numerous army of Mahrattas from Poonah and Berar. About the same time the Rohillas, a tribe from the mountains which separate India from Persia, erected an independent state on the Ganges, within eighty miles of Delhi. Mahommed Shah was succeeded by his son Ahmed Shah, and in the reign of the latter the Mogul empire was finally dismembered. A small territory around Delhi was all that remained to the house of Timur, and it was the scene of devastation, massacres, and famine. The last imperial army that ever assembled was defeated in 1749 by the Rohillas. The Jauts founded a state in the province of Agra; the nizam and Aliverdy ruled in Bengal and the Deccan; Oude and Allahabad were each seized by independent chiefs; Malwah was divided between the Poonah Mahrattas and several native princes and zemindars. Ajmere reverted to its ancient lords, the Rajpoot princes. The Mahrattas, who now contended for the dominion of India, possessed, in addition to their share of Malwah, the greatest part of Gujerat, Berar, and Orissa, besides their ancient domains in the Deccan. "The whole country of Hindustan proper," Major Rennell remarks, "was in commotion from one extreme to another, each party fearing the machinations or attacks of the other; so that all regular government was at an end, and villany was practised in every form. Perhaps in the annals of the world it has seldom happened that the bonds of government were so suddenly dissolved, over a portion of country containing at least sixty millions of inhabitants."[1]

Decay of the Mogul empire.

---

[1] Rennell's *Memoir of Hindustan*, p. lxx.

Hindustan.

In 1753 the Emperor Ahmed Shah was deposed by Gazi, the son of Gazi o'Dien, vizir to Mahommed Shah, who placed on the throne Allumguire II., grandson of Bahader Shah, and invested himself with the office of vizir. His perfidious conduct to the family of the viceroy of the provinces of Moultan and Lahore, under Abdalli, the king of the Afghans, involved the emperor in a quarrel with that powerful prince, who advanced from Candahar to Lahore, and thence to Delhi, the gates of which were opened by the feeble emperor, and the defenceless city abandoned for weeks to a licentious soldiery. After the retreat of the Abdallis, the vizir advanced with an army to Delhi, which he entered after a siege of forty-five days. The Mogul emperor was now reduced to the most abject state of dependence, and was at last assassinated by order of the vizir, who was irritated by his correspondence with the Afghan monarch Abdalli Shah, the Rohillas, and the nabob of Oude, with whom he himself was at war. His son took the title of Shah Aulum; he escaped from Delhi when it was besieged by the vizir, and, after a series of misfortunes, at last surrendered to the British, who gave him an asylum, and a pension for his support; and with him, the last of the Mogul sovereigns who enjoyed independent power, closes for ever the glory of this renowned empire.

Contest between the Mahrattas and the Afghans.

In the mean time, amidst anarchy and desolation, the Mahrattas were daily increasing in power; they were engaged in every scene of politics and warfare, from Gujerat to Bengal, and from Lahore to the Carnatic; they possessed extensive sway and vast armies; and their ambition was now to reconstruct a new Hindu empire out of the decayed fragments of the Mogul power. The rising influence of the Afghans under the rigorous sway of Abdalli was the only obstacle to this patriotic or ambitious scheme; and the Mahrattas, in the progress of their conquests northward, encountered for the first time their great rival for the dominion of India. Ahmed Abdalli, king of the Afghans, was taken prisoner when very young by Nadir Shah; he was first his slave, afterwards his mace-bearer, and at his death, having collected a body of troops and other adventurers, he proceeded to his own country, and proclaimed himself king of the Afghans, with the title of Doordowran, or pearl of the age, which was corrupted into that of Dooranee, and became the name of one of the Afghan tribes. Ahmed had extended his dominion over the frontier provinces of Moultan and Lahore, which, in retiring from India, he had left under the administration of his son. These provinces were first invaded by the Sikhs, and afterwards by the Mahratta generals, who advanced to Lahore and expelled the Abdalli prince, and afterwards extended their conquests to the Indus. Ahmed Shah, roused by the loss of his provinces and the dishonour of his arms, collected his troops, and encountered the Mahratta army, amounting to 80,000 veteran cavalry, which was almost entirely destroyed, and the general Duttah Sindia slain. The news of this defeat spread alarm amongst the Mahrattas, and roused them to the greatest exertions. A vast army, consisting of 140,000 horse, besides a numerous train of camp followers, commanded by the most renowned chiefs, took the field, and being unable to cross the Jumna, still swollen by the rains, proceeded to plunder Delhi, the capital. Ahmed Shah, with 150,000 well-disciplined troops, now advanced, and, in his impatience to meet the enemy, plunged with his whole army into the foaming waves of the Jumna, which he crossed in safety. The Mahrattas, struck by this daring exploit, retired to the plain of Paniput, and the armies continued in sight of each other from the 26th October to the 27th January 1761, during which interval several bloody skirmishes took place.

Battle of Paniput.

On this latter day was fought the battle of Paniput, one of the most decisive and sanguinary recorded in history. The Mahrattas were overthrown with a dreadful carnage. The general, Bhaow, the nephew of the peshwa, the chief of the Mahratta nation, was killed early in the action; most of the other chiefs were slain, and those of the soldiers who escaped from the slaughter of the field were massacred by the irritated peasantry, in revenge for the depredations of the Mahratta cavalry. And of the mighty host engaged in this fatal conflict, only a small remnant, with three generals, returned to the Deccan. This great battle gave an irreparable blow to the Mahratta power, which from this time sensibly declined, and the victorious Abdalli sought no other fruit of his victory. He returned to his capital after remaining a few months at Delhi, having recognised the son of Aulungeer as emperor, under the title of Shah Aulum the Second.

Ris the Eur ean pow

A new scene was now about to open in India. The Europeans, who as traders had long maintained establishments on the coasts, began to assume an entirely different character; to contend with each other in the field for dominion, and to mingle in all the wars and politics of the interior. It was necessary, for carrying on the domestic trade of India, and more especially in providing goods for the supply of Europe, that a body of experienced servants should reside on the spot, in order to collect and to purchase commodities for exportation; an employment which, owing to the poverty and abject state of the natives, and their peculiar customs, involved duties of the most minute and laborious detail. During the decline of the Mogul government, the tranquillity of India was frequently shaken by the contentions of rival chiefs; and the slight security afforded, even in the best times, to commerce, became in this manner more imperfect. For the reception of the goods which it was necessary to collect and store up, that cargoes might always be in readiness for the Company's ships, warehouses were built, which, with the counting-houses, and other apartments for the agents and business of the place, constituted the factories of the Company. These factories contained a valuable store of property, which, in the disordered state of India, it became necessary to secure from the rapacity both of governments and of individuals. They were therefore strongly built and fortified; their inmates were armed and disciplined; and, for better security, regular troops were occasionally maintained in those mercantile garrisons. In these defensive arrangements of the Company we may discern the rudiments of their future empire.

The territorial acquisitions of the European companies were, however, still inconsiderable. The English East India Company had in 1698 been permitted to purchase the zemindaryship of the three towns of Sootanutty, Calcutta, and Govindpore, with their districts, to which was afterwards added a district extending ten miles from Calcutta, on each side of the river Hooghly, containing thirty-seven towns. On the Coromandel coast the English possessed Madras, with a small adjoining territory five miles along the shore, also Fort St David, in 11. 40. north latitude, with other places, such as Vizigapatam and Balasore; and on the west coast their principal settlement was the island of Bombay. Factories were also established at Surat, Tellicherry, and several other places. The business of the Company was managed by the three independent presidencies of Bombay, Madras, and Calcutta. The presidency consisted of a governor and council of nine, twelve, or any greater number of members, as might seem expedient, in a majority of whom all power was vested. The members of the council were not excluded from other more lucrative offices, which were, in general, shared amongst them. These offices were chiefly in the gift of the president, and, by means of his influence, the council were, in a great degree, placed under his control. The governor and council exercised the most ample powers over the servants of the Company; and with regard to all others, they could seize and imprison them, and afterwards send them to England. The powers of martial law were bestowed on them at an early period, for maintaining the discipline of the troops under their orders; and, in 1661, a charter of Charles II. gave them the power of administering civil and criminal justice according to the laws of England.

Pondicherry, with a small appendage of territory, was the principal seat of the French power on the continent of India. It had under its authority three factories, one at Mahé, on the Malabar coast, not far south from Tellicherry; one at Rarical, on the Coromandel coast; and one at Chandernagore, on the river Hooghly, in Bengal. The form of government was the same in the French as in the English settlements.

In 1744 France and England, from being auxiliaries, became principals in the war which was then raging in Europe, and the flame soon communicated to their distant colonies. In India the two rival powers were quickly involved in hostilities, which, however, were followed by no important result; and the English settlement of Madras, which had been taken by the French king, was restored at the peace of Aix-la-Chapelle. It was soon after this that the French and English, in supporting the contending claims of the native princes, again came into collision. At the respective settlements of the two Companies, the number of troops assembled during the previous war was greater than was necessary for defence, and the servants of the Companies, with such means at their disposal, now began to meditate schemes of conquest. The intricacies of Indian politics, and the family connexions of the different claimants who contended for power and dominion, need not be described in detail, as it would neither be instructive nor acceptable to the general reader. A brief sketch is all that will be necessary to explain the nature of those transactions which so deeply affected the future condition of India, and the relations of the parties engaged in them.

When Nizam-ul-Mulk was appointed ruler of the Deccan, with the title of subahdar, by the Emperor Aurungzebe, a chief named Sadatullah was nabob of the Carnatic. At his death, his son Doost Ali succeeded him as nabob, which proved displeasing to the nizam, who claimed the right, as delegate of the emperor, to appoint the viceroy of the Carnatic. He accordingly chose, first his general Cojah Abdoolla, and afterwards Anwar ad Dien Khan, known to the English as Anoverdy Khan, to be governor of the Carnatic in 1745. It was between these two families that the contest now began for the government of the Carnatic; Chunda Saheb, a distant relative of the family of Sadatullah, being supported by the French under their aspiring and ambitious governor Dupleix. The death of Nizam-ul-Mulk, in 1748, at the extreme age of 104, occasioned another dispute in the succession to the government of the Deccan, between Nazir Jung, his son, who was supported by the English, and Mirzapha Jung, his grandson by a daughter, who was aided by Chunda Saheb and the French. The latter in 1749, with 40,000 native troops, 400 French, 100 Caffres, and 1800 Sepoys, advanced against Anwar ad Dien. His camp was gallantly stormed by the French troops, he himself was slain, at the age of 107, his eldest son was taken prisoner, and his second son, Mahommed Ali, with the wreck of his army, escaped to Trichinopoly. Nazir Jung, hearing that the nabob of the Carnatic was defeated, collected an army, and summoned Mahommed Ali from Trichinopoly to his aid. He also requested assistance from the English, who sent Major Laurence from Fort St David with 600 Europeans to join his army. When the armies approached each other, D'Auteuil the French commander, being deserted by some of his officers, suddenly retreated to Pondicherry, leaving to their fate Mirzapha Jung, who surrendered to his uncle, and was immediately put in irons, and Chunda Saheb, who followed with his troops to Pondicherry. But the enterprising Dupleix made new exertions, and having again taken the field, he attacked the camp of Nazir Jung, his former ally, who in the confusion was shot through the heart. Mirzapha Jung being now freed from imprisonment, assumed the authority of subahdar. He was afterwards shot dead with an arrow in an action with the rebellious Patan chiefs, and, by the influence of M. Bussy, who commanded the French troops, Salabut Jung, the eldest surviving son of Nizam-ul-Mulk, was raised to the government. After some unsuccessful operations, the English, with their allies, were compelled to take shelter under the walls of Trichinopoly, which was now besieged, though with little effect, by the enemy.

In this indecisive state of affairs at Trichinopoly, it was suggested by Captain Clive, who had already distinguished himself by desperate bravery and great military skill, that it would be advantageous to carry the war into the enemy's country; and being intrusted with the execution of his own bold designs, he began an attack on Arcot, the capital of Chunda Saheb. He had under him 210 Europeans and 500 Sepoys; and so secret and sudden were his motions, that he was master of the enemy's capital ere they were apprised of his march. Here he was soon invested, in the fort which defends the town, by a numerous army, and several practicable breaches being made, an assault took place, which was repulsed with loss; the assailants were finally compelled to raise the siege, and being pursued by Clive, were attacked and totally defeated on the plain of Arani, on the 3d of December 1751. The forts of Tinnery, Conjeveram, and Arani, immediately surrendered to Clive, who returned in triumph to Fort St David. He was soon recalled by the operations of the enemy, who were encouraged by his absence again to take the field. With a very inferior force he adventured on a battle, and by the well-concerted manœuvre of sending round a detachment to fall upon the rear of the enemy, whilst the English charged with the bayonet in front, he obtained a decisive victory, and the hostile army was saved from total ruin only by the darkness of the night. On his return to Fort St David, Clive was superseded in his command by Major Laurence, who detached him with 400 Europeans, a few Mahratta soldiers, and a body of Sepoys, to cut off the enemy's retreat to Pondicherry, in which he was, as usual, completely successful, having made the French commander M. d'Auteuil prisoner, with all his troops. The enemy were now greatly distressed for want of provisions; and Chunda Saheb, deserted by his troops, surrendered to the king of Tanjore, an ally of the English, by whom he was beheaded, in order to prevent all disputes with the Mysorean and Mahratta chiefs about the custody of his person. After the flight of Chunda Saheb, his army was attacked and routed by Major Laurence; and the island of Syringham, where his troops were encamped, was taken, with about 1000 French soldiers, under the command of Mr Law, the son of Law the author of the Mississippi scheme. Notwithstanding these disadvantages, Dupleix was not discouraged. The English resolved to commence the siege of Gingee, which was garrisoned by the French. In this operation they failed. But the French were afterwards defeated in an action near Bahoor, two miles from Fort St David; and the two forts of Coveling and Chingleput were reduced by Captain Clive.

Early in January 1753 the two armies again took the field. The French force consisted of 500 European infantry, sixty horse, 2000 Sepoys, and 4000 Mahrattas, commanded by Morari Row. The English had 700 European infantry, 2000 Sepoys, and 1500 horse belonging to the nabob. The two armies, avoiding a general action, watched each other's movements, when General Laurence was apprised that Captain Dalton, the commandant of Trichinopoly, had only provisions to serve him three weeks. He immediately marched with all his forces to his relief, and being followed by the French, this place became the object of an active contest, from May 1753 till October 1754. We have already stated that the two main points of dispute between the French and English were, first, the succession to the government of the Deccan; and, secondly, to that of the Carnatic; the English, in the first of the disputes, supporting the claims of Nazir Jung, the son of Nizam-ul-Mulk, against Mirzapha Jung, the grandson of the nizam, who was supported by the French. After the death of Nazir Jung, who was killed in the attack of the French upon his camp, Mirzapha Jung succeeded to the subahdarship of the Deccan. He was killed in battle, as already related, by an arrow, when, through the influence of the French commander, M. Bussy, Salabut Jung, the eldest surviving son of Nizam-ul-Mulk, was raised to the vacant throne. But on the death of Nazir Jung, his eldest son Ghazee ad Dien solicited and received from the Mogul the appointment of subahdar of the Deccan; and he appeared at Aurungabad in October 1752, to support his title, at the head of 150,000 troops. The Mahrattas at the same time supported him, and entered the province of Golconda with 100,000 horse. The French general Bussy and Salabut Jung now took the field to meet these armies, with very unequal numbers, when Ghazee ad Dien Khan suddenly died. The Mahratta generals continued the war, but in every encounter they were repulsed with such fearful loss by the French, that they agreed to conclude a peace on the cession of certain frontier districts, to which Salabut Jung willingly agreed.

In the other point in dispute, namely, the government of the Carnatic, the English espoused the cause of Mahommed Ali, the second son of Anwar ad Dien, who was appointed nabob by Nizam-ul-Mulk; and the French supported Chunda Saheb, the heir of the first deputy Sadatullah, appointed also by Nizam-ul-Mulk. On his death they claimed the right of appointment for Salabut Jung, the subahdar, and who, owing his throne to their powerful support, had become a passive tool in their hands. From him M. Bussy had obtained the cession of the four important provinces of Mustaphanagar, Ellore, Rajamundry, and Chicacole, called the Northern Circars. It was in these circumstances that a suspension of arms was agreed upon in October 1754; and on the 26th of December following a provisional treaty was signed at Pondicherry, by which both parties agreed to abstain from interfering in the internal affairs of the country, and to establish their territorial acquisitions on a principle of equality. These terms were entirely in favour of the English, as they left Mahommed Ali nabob of the Carnatic, and obliged the French also to the cession of the four Circars which they had obtained from Salabut Jung. But this treaty was in truth a dead letter; and the moment it was concluded the English, in virtue of their alliance with the nabob, proceeded to reduce to obedience, and to collect the revenues of the districts of Madura and Tinnevelly. Here, however, they encountered the Colleries, a fierce tribe inhabiting the hilly districts, who obstinately contested every inch of ground; so that they got abundance of hard blows, and little money, scarcely enough indeed to pay the expense of this plundering adventure. The English, when they made their first conquests in India, having conceived vast ideas of its wealth, set no bounds to their rapacity; they were eager to revel in the spoil of the country, and it was only stubborn facts and repeated disappointments that at last dispelled their dreams of avarice. The French, after remonstrating in vain against this conduct of the English, proceeded to follow their example, by reducing to obedience and plundering the petty chiefs of the country.

Whilst the two contending armies were maintaining this predatory warfare, the active and enterprising Bussy was in another quarter securing the ascendency of the French; and, whether in the cabinet or in the field, he still signalized his talents as a warrior and a statesman. Salabut Jung, influenced by his courtiers, had induced the French troops to quit his territories, which order Bussy speedily obeyed, and commenced his march. Finding that he was betrayed, and his progress intercepted by hostile chiefs, he skilfully selected a strong position, which he defended till succours arrived from Pondicherry; when the fickle prince again solicited his alliance, and he was restored to still higher influence than before. Salabut Jung, when he had resolved to dismiss the French troops, had applied to the presidency of Madras for a force to supply their place; and this opportunity of extending their influence would have been eagerly embraced by the English, but their power was now threatened in another quarter, by new and unexpected dangers. Bengal now became the great scene of Indian warfare, in which were concentrated all the resources of the English, from every part of their territories. This extensive province, with Orissa and the province of Allahabad and Berar, was governed, towards the latter end of Aurungzebe's reign, by his grandson Azeem Ooshaun, second son of Shah Aulum, who succeeded to the throne. Jaffier Khan was appointed his deputy; and, as frequently happened during the decline of the Mogul empire, from a deputy he became an independent sovereign. Sujah Khan, who was married to the daughter of Jaffier Khan, was appointed his deputy in the government of Orissa. In this elevated station, a distant relative, Mirza Mahommed, who had once been in the service of Azeem Shah, the second son of Aurungzebe, and had since fallen into poverty, resorted to his court for employment, and he was kindly received. He was followed by his two sons Hadgee Ahmed and Mirza Mahommed Ali, who both obtained employment; and, by their respective talents for business and war, they soon acquired favour and influence in the court of Sujah Khan. Jaffier Khan died in 1725, and was succeeded by Sujah Khan, who supplanted Sereffraz Khan, the destined heir. In 1739 he added to his dominions the province of Bahar, and intrusted its administration to Mirza Mahommed Ali, under the title of Aliverdy Khan. In 1739 Sujah Khan died, and was succeeded by his son Sereffraz Khan, who hated Aliverdy Khan and his brother, and took no pains to conceal it. Aliverdy in the mean time obtaining from the imperial court his nomination to the government of Bengal, collected his troops, and having defeated Sereffraz in a battle in which he was slain, he reduced the country to subjection, and governed it with a regard to justice and humanity very unusual in the East. His reign was, however, one continued scene of commotion, from the irruptions of the Mahrattas, who, though they were often vigorously repelled by Aliverdy and his troops, always returned with new vigour to the invasion of the country. Aliverdy died on the 9th of April 1756, at the age of eighty, and was succeeded by his nephew Suraja Dowla, who had all the vices of a regularly educated prince. His first act was to plunder the sister of Aliverdy Khan, who was reputed to possess great wealth; he gave orders to seize the treasurers of her family, one of whom, however, contrived to escape, and found an asylum in Calcutta. Incensed by the protection given to this fugitive, and jealous besides of the designs and growing power of the Europeans, he took the field on the 30th of May 1756, with an army of 40,000 foot, 30,000 horse, and 400 elephants. The factory at Cossimbazar was seized, and its chief, Mr Watts, and his surgeon, who accompanied him, were retained prisoners. Calcutta was invested on the 18th of June. It was feebly defended, and at last a retreat was resolved upon, which was executed so precipitately that numbers were left behind in the fort by the ships and boats. In this trying situation Mr Holwell was chosen commander, who, seeing no chance of a successful defence, proposed a capitulation in a letter which he threw over the ramparts. In the mean time the troops having gained access to the liquor, were so intoxicated as to be incapable of defence, and the enemy entered the fort without resistance. The subahdar appears on this occasion not to have intended any inhumanity to the garrison; and when Mr Holwell was brought into his presence with his hands tied, he ordered them to be loosed, and pledged his honour as a soldier to him and his companions that not a hair of their heads should be touched. But, notwithstanding these assurances, the tragical scene which ensued has no parallel in the annals of human misery. When night approached, it became necessary to secure the prisoners in some place of confinement; and for this purpose the common prison of the garrison was chosen, which was about eighteen feet square, with only two small windows barred with iron. Into this small apartment the garrison, 146 in number, were compelled to enter, by threats of being instantly cut down if they resisted. Their sufferings from want of air were dreadful, and bribes were offered to the guard to obtain a room for them in which they could breathe. But none dared to awake the sleeping tyrant whose prisoners they were; and, after a night of inexpressible horror, only twenty-three out of 146 were found alive in the morning. The presidency of Madras being apprized of these disasters, determined on sending Colonel Clive, who had now returned to India, to Bengal, with as large a force as could be collected; and an armament accordingly sailed from the roads of Madras on the 16th of October, consisting of five king's ships under Admiral Watson, besides transports having on board 900 European troops and 1500 Sepoys. Having arrived in the Ganges on the 20th of December 1756, they found the fugitives at Fulta, a town at some distance from Calcutta, down the river. The first operation was against a fort; and Clive, lying in ambush to intercept the garrison, was himself surprised by the troops of Suraja Dowla, and, after a conflict long doubtful, extricated himself from the dangers that surrounded him, by that admirable presence of mind which never deserted him in the hour of danger. On the 2d of January 1757, the armament arrived at Calcutta, which surrendered after a cannonade of two hours. Almost the whole property of the Company was recovered, having been preserved for the subahdar; but the houses of individuals were all plundered. On the 10th of January, the city of Hooghly, about twenty-three miles higher up the river, was attacked, and a breach being made, and an assault begun, the garrison sought safety in flight. In the mean time, intelligence was received from Europe of the commencement of hostilities between France and England, which placed in a very critical situation the Company's settlements in Bengal. The English were already engaged in a war with a powerful prince, who had a formidable army in the field; and a coalition with the French, who could muster 300 European troops, with a train of artillery, would have overwhelmed their infant power. Happily for them, the French were desirous of a neutrality, and refused the alliance of Suraja Dowla, who advanced with his whole army and surrounded Calcutta. The perils which now environed the English roused the daring spirit of Clive, and he resolved to surprise the enemy's camp before daylight. But this bold enterprise failed in the execution; the troops suffered severely, and a thick mist augmented the causes of confusion; still the boldness of the design produced the desired effect, by alarming the subahdar, and inclining him to peace. He accordingly concluded a treaty with the English, by which he agreed to restore to the Company their factories, and all their former privileges; to make compensation for the losses they had suffered, and to permit them to fortify Calcutta. The danger which now threatened the Company being averted, the active mind of Clive was directed to other objects; and as war was now declared between France and England, he resolved, in return for the neutrality observed by the French when the English were involved in hostilities with the nabob, to attack their settlement at Chandernagur. This scheme was opposed by the nabob, and was disapproved by the council and Admiral Watson. Reinforcements, however, arriving, the attack was resolved on, and the English force advanced. The French defended themselves with gallantry; and the nabob, alarmed, began to put his army in motion. But the fort was in the mean time reduced by the irresistible fire of the ships. The nabob viewed these proceedings with secret alarm and resentment, and refused to give up the other French factories and subjects in his dominions. He even afforded protection to the fugitives from Chandernagur, and evinced his decided hostility to the English, until he received intelligence of the progress of the Afghans in the north, when he became extremely desirous of peace. But the English were now dazzled with other schemes, and Clive strongly insisted on the rooted disaffection of the nabob to the English, and on the necessity of dethroning him, and of elevating Meer Jaffier, who had married the sister of Aliverdy Khan, to the throne in his stead. It is unnecessary to dwell particularly on the dark intrigues by which this scheme was carried into effect. It was concerted that, for the destruction of Suraja Dowla, the English should take the field; and that Meer Jaffier, who still had a considerable force under his command, should join them at Cutwa. The English, having arrived at Cutwa, found not their expected ally Meer Jaffier; only an intimation from him that he could not join them before the day of battle, but that during the action he would desert the nabob and join his enemies. This intelligence damped the ardour of the English, and it was deemed hazardous to advance further, and to risk a battle, when, "if defeat ensued, no one would return to tell it." But caution at length gave way to bolder counsels; the army crossed the river a little past midnight, at Plassy. Here also was intrenched the army of the subahdar, consisting of 50,000 foot, 18,000 horse, and fifty pieces of cannon. The English force consisted of about 1000 Europeans and 2100 Sepoys. During the battle, which took place on the 23d of June 1757, Meer Jaffier was observed moving off with his troops. Clive, now assured of his intentions, ordered an attack; the subahdar's army was dispersed, and he himself fled from the field with only 2000 attendants. Arriving at his palace, he found no friend on whom he could rely; and disguising himself as a fakir, he escaped, with a favourite concubine and a single eunuch, intending to make his way to the French. But he was discovered at Raje Muhl, dragged back to Moorshedabad, and placed under the custody of Meer Jaffier's son, who gave orders for his assassination. On the 25th of June, Clive arrived with his victorious army at Moorshedabad. Meer Jaffier took possession of the capital, and on the 29th was installed into his high office, in the presence of the rajahs and grandees of the court. Enormous sums were exacted from Meer Jaffier as the price of his elevation; for the Company 10,000,000 rupees, as a compensation for losses; 5,000,000 rupees to the English inhabitants, 2,000,000 to the Indians, and 700,000 to the Armenians; for the squadron 2,500,000; an equal sum for the army; and for the members of the council, which they actually received, namely, for Mr Drake the governor, and Colonel Clive, 280,000 rupees each; and Mr Becker, Mr Watts, and Major Kilpatrick, 240,000 each; the whole amounting to

L.2,697,750. The English, deluded by their avarice, still cherished their extravagant ideas of Indian wealth; nor would they listen to the ungrateful truth. But it was now found that there were no funds in the Indian treasury to satisfy their inordinate demands. They were in the end obliged to be contented with one half the stipulated sum, which, after many difficulties, was paid in specie and in jewels, with the exception of 584,905 rupees.

The Company's servants, whilst their force was so actively engaged in Bengal, were anxious to remain quiet in the Carnatic. In endeavouring to collect the land-rents of the nabob Mahommed Ali, they, however, undertook the reduction of Madura and Tinnevelly; but with no great success, Captain Calliaud being repulsed in an assault on the fort of Dindigul, and another division of the English force at Nelore. The French now resolved to take advantage of the division of the enemy's force, and to strike a decisive blow; and having collected every soldier that could be spared from garrison duty, they suddenly with their whole force invested the fortress of Trichinopoly. On the 14th of May 1757, Captain Calliaud being apprized of their design whilst he was besieging Madura, instantly began his march for the relief of this important place. It was surrounded by an army five times as numerous as his own force, and every avenue to it was strongly guarded. But the English commander, well acquainted with the localities, took his route through a large plain consisting of rice fields covered with water, which was deemed impassable by the French, and therefore left unguarded; and thus he entered the fort. The French general, disconcerted by this successful stroke, drew off his forces and returned to Pondicherry. Having thus secured Trichinopoly, Colonel Calliaud resumed the siege of Madura, and being repulsed, with heavy loss, in an attempt to storm, he turned the siege into a blockade. He was at last received into the town on payment of 170,000 rupees. In the mean time Bussy was eminently successful in all his operations within the Circars; he reduced the fortress of Vizigapatam held by the English; and, after some uncertainty in the unstable councils of Salabut Jung, he finally established an entire ascendency over that prince and throughout the Deccan.

On the commencement of the war between France and England in 1756, the French ministry resolved to send a formidable armament to India; and the Count de Lally, an Irishman, who had left his country with James II., and who had distinguished himself in the battle of Fontenoy, was appointed commander-in-chief of all the French forces in India. Count Lally, with his armament, arrived on the coast of Coromandel on the 25th of April 1757. The English Admiral Pococke had been previously joined by a squadron of five ships of war, and an engagement took place between the two fleets, which terminated to the advantage of the English. Another action took place after the ships were refitted, with the same result. But neither was decisive; and, notwithstanding these successes at sea, the French had a preponderating force on shore, which consisted of 2500 Europeans, and the same number of Sepoys. With this force they commenced, on the 17th of May 1758, the siege of Fort St David. The place capitulated on the 1st of June, and its fortifications were razed. Devicottah surrendered on the 7th of June, and the English now fully expected that Lally would next lay siege to Madras. But the want of money embarrassed all his operations; and in order to relieve his necessities, he undertook the siege of Tanjore. A breach was effected, and preparations made for an assault, when the arrival of the English fleet, after another engagement with the French before Carical, whence the besieging army derived all its supplies, determined Lally to raise the siege; and, after a disastrous retreat, his shattered force arrived on the 28th at Carical. The hostile fleets again encountered on the 2d of August, and after an hour's fighting the French bore away, and were soon beyond the reach of shot. Lally, to relieve his pecuniary wants, which were only augmented by the unsuccessful siege of Tanjore, now prepared for an expedition against Arcot. This place capitulated on the 4th of October, and the French force proceeded forthwith to Chingleput, about forty-five miles south-west of Madras. But the English, aware of its importance, reinforced the garrison, and Lally did not attempt its reduction. His situation was beset with difficulties, from the total want of money and all necessary supplies; and in order to retrieve his affairs, he resolved on the bold enterprise of laying siege to Madras. His force consisted of 2700 European troops, and 4000 Indians. In this attempt he signally failed, with great loss, after continuing the siege from the 16th of December till the middle of February 1759; and this disaster greatly contributed to depress his spirits, and to abate his vain confidence in his own schemes. The French army retreated in the direction of Conjeveram, whither they were followed by the English. Here the two armies manœuvred for some time in sight of each other, when the English marched upon Wandewash, and afterwards on Conjeveram, which they took by assault. On the 28th of May 1759 both armies went into cantonments.

In the end of September the campaign was resumed with spirit by the English, who laid siege to Wandewash, but were repulsed in all their attempts to carry it by storm. But it was attacked and taken on the 29th of October, as was also Caranjoly on the 10th of December. Bussy had been recalled from the Carnatic, where he had exerted himself so advantageously for the French cause, and he joined the army the day after the repulse of the English. Lally had resolved to divide his force; with one part to collect the rents of the southern, with the other to protect what belonged to the French in the northern districts. He contrived by skilful manœuvring to amuse the English, and in the mean time he surprised and took Conjeveram, and thence proceeded to the attack of Wandewash. The English army under Colonel Coote now approached, consisting of 1900 Europeans, 2100 Sepoys, 1250 black horse, and twenty-six field-pieces; and the French general determined to try the issue of a general battle. The French, including 300 marines and sailors, consisted of 2250 Europeans, and 1500 Sepoys. The battle commenced on the 22d of January 1760, at eleven o'clock, and terminated in the total defeat of the French, who lost nearly all their cannon. Lally retreated to Chittapet, about twenty-eight miles from the field of battle, and afterwards to Gingee and Valdore. The victorious general resolved on the reduction of Arcot, and having previously taken Chittapet, he arrived before that fortress upon the 1st of February, and upon the 9th the garrison capitulated. The affairs of the French now rapidly declined. The English had acquired a decided superiority in the field, and fortress after fortress fell into their hands; Tinery on the 1st of February, Devicottah about the same time, and Trincomalec on the 29th. To complete this train of misfortunes, Admiral Cornish arrived at Madras with six men of war; and there being no longer a hostile fleet in the Indian Seas, he readily agreed to co-operate with the land forces. The consequence was, the reduction of Carical on the 5th of April, of Valdore on the 15th, of Chittambaram on the 20th, and about the same time of Cuddalore; and on the 1st of May the whole French force was shut up in Pondicherry, which was their last remaining hope in India, whilst the English forces encamped within four miles of the town. It was in the beginning of September that the English laid formal siege to this place. The batteries were opened about the beginning of December, and it capitulated on the 15th of January 1765; and thus terminated for ever the power of France in this quarter of the world.

im to
throne.

Whilst the English were thus establishing their ascendency in the south of India, and also in Bengal, Meer Jaffier, the new nabob, was wholly unable to answer the exorbitant demands of the Company's servants, who, still deluded with the idea of eastern riches, refused to abate one iota of their demands. His situation thus became extremely difficult. His treasury was exhausted, his people impoverished, he had no funds for the expenses of government, and still less for the demands of his rapacious allies. He was compelled to extort money from his ruined subjects by cruelty and terror. He himself, and his son Meeraus, soon fell into universal odium and contempt, from their merciless exactions, and the weakness, negligence, and disorder of their administration. The troops mutinied for want of pay, the rajahs and nobles were discontented, and rebellions multiplied throughout his dominions. The nabobs of Oude and Allahabad entered into a dangerous confederacy with the eldest son of the Emperor Aulumgeer II. for supporting his claim to the imperial throne, and to the subordinate provinces of the Mogul empire; and their combined forces advanced to the invasion of Bengal. But European troops, though few in number, and European counsels, proved an overmatch for the ill-organized masses of Indian cavalry; they were accordingly defeated in every encounter, and Meer Jaffier secured in the undisputed possession of the throne. Lord Clive, who bore so conspicuous a part in these transactions, resigned the government in February 1760; and by his influence Mr Vansittart was raised to be president or governor of the council, consisting of from nine to twelve persons, by a majority of whom the affairs of the Company were now administered. The English, by their prompt and decisive measures, had defended the nabob against foreign aggression; and he had now to defend himself against their own domestic treason, which proved to be the more serious danger. In raising him to the sovereignty they were actuated by purely interested views; and being disappointed, they entered into schemes for dethroning him, and for again selling the throne to the highest bidder. Meer Cossim, married to his daughter, was the person now pitched upon to supply his place. The conditions were, that he should assign to the Company the revenues of the three districts of Burdwan, Midnapore, and Chittagong; that he should pay the balance due by Jaffier; and besides, make a present of five lacs of rupees for the war in the Carnatic. Mr Vansittart now proceeded, with a body of troops under Colonel Calliaud, to persuade, or rather to compel, the nabob to abdicate the sovereignty. At day-break his palace was surrounded with troops, and a letter was sent to him explaining the views of the English, which filled him with rage. He treated with disdain the assurances of safety for his person, and that a reform in his government under his son-in-law as his deputy was all that was proposed; and he finally preferred, rather than sway a barren sceptre, to retire to Calcutta under the protection of the English. Against the deposition of Meer Jaffier several members of the council protested, and this spirit of opposition for a considerable time distracted the English councils. The party who had elevated Meer Cossim highly commended his whole administration, which their opponents were equally solicitous to criticise and to condemn. Meer Cossim was a person of quite a different stamp from his weak and indolent predecessor. By the assistance of his new allies he cleared his dominions of all invaders, and strengthened his frontiers; he reduced the rajahs or independent Indian chiefs, who had rebelled against Jaffier, obliging them to pay the usual tribute, by which means he repaired his finances; he introduced order and economy into his whole administration, and by regular pay secured the discipline and fidelity of his troops. But his conduct was viewed in a sinister light by the members of the council who opposed his elevation; and four of them being dismissed by the directors at home for insubordination to their authority, this faction became the majority; and the most violent amongst them, Mr Ellis, was sent to superintend the factory at Patna, the residence of the nabob, where his whole conduct was one continued insult and defiance of his authority. He made no scruple of seizing and punishing the officers of the nabob, who acted under his express sanction; sometimes throwing them into prison, or sending them in chains to Calcutta, to be there punished at the discretion of the council. To these were added other and more extensive injuries; and at length the usurpations and tyranny of the English were carried to such a height, that the authority of the government either became a mere name, or an instrument of violence and extortion in the hands of the Company's servants. The causes of these disorders, which led to a new and important revolution in the political condition of India, we shall now briefly explain.

Disputes with Meer Cossim.

Cause of these disputes, and oppression of the country.

In India the transit of goods from one place to another was, under the native governments, subjected to a tax; and upon all the roads and navigable rivers toll-houses were erected, where this tax was paid. These toll-houses were multiplied, to the great inconvenience and oppression of the internal trade; and as the duties varied in different places, there was here a wide field for abuse, and the traders were frequently oppressed by the arbitrary extortions of the collectors. The East India Company had, at an early period, procured a firman, which exempted from all internal duties, both the goods which they imported from Europe, as they passed into the interior, and those which they purchased in the interior in their passage to the sea. They were, in fact, protected by a certificate signed by the president or chiefs of the factories, called a *dustuck*, and shown at the toll-houses or chokeys through which they passed. The servants frequently endeavoured to abuse the Company's privilege, by claiming an immunity from taxation for all their own goods, which they had neither imported nor were to export, but which, for the internal supply of the country, they were transporting from one place to another. The subahdars of Bengal, whilst they retained their power, restrained the Company's privilege within its appointed limits, and steadily refused to exempt the trade of its servants from duties to which all others were subject. But when, by the elevation of Meer Jaffier to the throne, the English acquired the undisputed ascendency, they broke through all the equitable restraints imposed upon them; in every district, in every market and village, they dealt in rice, the common food of the people, paddy, betel-nut, oil, fish, straw, bamboos, &c. and, without scruple, used the Company's passport to screen these articles from internal duties; and so dreaded was the English name, that the toll-house keepers no longer exacted the public dues on the transit of their goods through the country. In some cases where the demand was made and the goods stopped, the toll-keeper was arrested by a party of Sepoys, and carried prisoner to the nearest factories; and he was frequently exposed to even greater severities, being tied up and lashed. The confusion into which the country was thrown by the injustice, the violence, and the cruelty, of those rapacious intruders, can scarcely be imagined. The native merchant, still burdened with the heavy duties, which were rigorously levied on him, was undersold in every market; and the Company's servants in a short time engrossed the whole commerce of the country. The unhappy natives were subjected to various other oppressions. It was a common practice of the Company's servants to defraud them both in purchase and in sale; to force goods from them at a lower, and to compel them to buy their own at a higher rate than the market price. Nor did the ordinary tribunals afford any protection against their injustice; a band of foreign adventurers, to call them by no harsher name, had usurped the sovereign power, which they rendered wholly subservient to their own schemes of enriching themselves at the expense of the country.[1]

Just conduct of Meer Cossim.

Meer Cossim, the ruler who had been set up by the Company, was extremely displeased with the conduct of their servants, and he represented in the strongest terms to the president and council the enormities to which the private trade had given rise. But the majority of the council were too deeply interested in these enormities to be moved by this just appeal of the sovereign in behalf of his oppressed people. They all participated more or less in the profits of the private trade, and they had no disposition to part with or to restrict this lucrative abuse. They even refused to pay nine per cent. of transit duties upon their goods, though this rate was far inferior to that paid by the native traders; and all that they would agree to was, out of their own liberality and free choice to pay a duty of two and a half per cent. on salt alone. The nabob, when he heard of the proceedings in council, and of the injurious treatment of his officers for duly executing his orders, was naturally filled with indignation; and he came to the resolution of abolishing all internal duties. There could not possibly have been a more moderate or equitable measure. It gave freedom and equality to all parties; it threw down at once all the restraints to fair and open competition, and gave to the Company's servants the unlimited freedom of trade. This just and liberal policy, however, was far from corresponding with their views, and it excited amongst them the most violent clamours. They were discontented at losing so fair an opportunity of amassing enormous wealth. Their conduct, as Mr Mill justly observes, furnishes one of "the most remarkable instances on record, of the power of interest to extinguish all sense of justice, and even of shame." They first insisted on an exemption for themselves from all internal duties, now they cried out in the rage of disappointed avarice against the extension of the same privileges to the inhabitants; and thus they reversed all the usual maxims of fair policy, in seeking immunities for foreigners which were refused to natives.

Arbitrary conduct of the Company's servants.

The conduct of Meer Cossim, in claiming justice for his oppressed subjects, was highly displeasing to the majority of the council. The exaction of legal dues upon English goods was represented as a violation of the Company's rights, and as evidence of a design to expel them from the country; and, for this new species of treason against the offended majesty of usurped power, it was resolved to depose him, and to replace Meer Jaffier on the throne, as nominal ruler of Bengal, on the well-understood condition of subservience to their views. A treaty was concluded, confirming the immunity which they claimed from all internal duties, with the exception only of two and a half per cent. on the article of salt, whilst those duties were re-imposed on the goods of all other merchants. Large presents were bargained for, and other payments to a great amount, as compensation for losses alleged to have been sustained by the Company's servants, in the course of their illicit interference in the domestic trade. These sums, which at first were estimated at ten, but soon afterwards mounted up to fifty-three lacs of rupees, equal to about L.625,000, were rigidly exacted, whilst large payments to the Company were still undischarged, and the public finances were sinking under the burden of an expensive war, great sums having been borrowed by the Company from its servants, at an interest of eight per cent., and, with all these aids, supplies were wanting both for the war and for the investment, the Company's ships frequently returning, in consequence, half loaded to Europe. Meer Cossim, on his side, saw plainly that matters were fast approaching to the extremity of war, and he made preparations for the contest. He transferred his capital from Muxadabad, as being too near Calcutta, and under the inspection of the English, to Mongheer, a place 200 miles farther up the Ganges, which he fortified in the best and most expeditious manner. He introduced European discipline among the troops, and he recruited his ranks with all the Armenian, Persian, Tartar, and other soldiers of fortune whom he could collect, and especially with such wandering Europeans or Sepoys as had borne arms in the English service. He substituted European muskets for matchlocks, and formed a train of artillery.

Hosti es with er Cossi

Hostilities commenced sooner than was expected, with the surprise and capture of Patna by Mr Ellis; a violent and rash measure, disapproved by several members of the council. The nabob immediately gave orders to stop several boats laden with arms that had been seized, and released on the representation of the English. Resistance was made, and in the course of the struggle which ensued, Mr Amyatt, a member of the council, and several other Englishmen, were slain. The contending armies now hastened to take the field; and Meer Cossim was overwhelmed by one unbroken series of disasters, which terminated in his dethronement and flight. A division of his army, which had advanced for the protection of Moorshedabad, was totally defeated on the 19th of July, by the English army, which consisted of 650 Europeans, 1200 Sepoys, two troops of native cavalry, and was afterwards joined by a battalion of Sepoys and a hundred Europeans. In advancing to the capital, Major Adam found the enemy strongly posted, with intrenchments fifteen feet high, defended by a numerous artillery. These were stormed, and the city of Moorshedabad was entered by the conquerors. The English, pushing forward, encountered the Indian army on the 2d of August 1763, consisting of 20,000 horse and 8000 foot, in the plain of Gheriah, near Sootie. They resembled European troops in clothing and accoutrements, and in their division into brigades; and the battle that ensued was obstinately contested for four hours. But the discipline and steadiness of the European troops finally triumphed, and the enemy fled, leaving all their cannon behind them. From this time the English were no longer opposed on equal terms in the field. It was only in strong positions and intrenchments that the enemy made a stand. A strong intrenchment at Oodwa was carried on the 5th of September, after it had detained the English for nearly a month; and Mongheer, the last stronghold of Meer Cossim, capitulated, on which he fled into the dominions of the nabob of Oude, and afterwards into the Rohilla country. Irritated by his misfortunes, the nabob wreaked his vengeance on the unhappy English prisoners who were in his power. He had formerly put to death several Hindus of rank who were thrown into prison on account of their wealth; and he now gave an order for the execution of about two hundred English, who had been taken at Patna; amongst others, of Mr Ellis, who had formerly tyrannized over and insulted him, and Mr Lushington, also high in the Company's service. They were invited to an entertainment, and, according to the odious maxims of eastern treachery, were barbarously murdered. A German of the name of Sumroo was the chief agent in this scene of cruelty. Dr Fullarton, who had gained favour

Defea nd flight Sujah Dowl

by his medical services, was the only Englishman who escaped.

Meer Cossim was received in the most friendly manner by Sujah Dowlah, the nabob of Oude, who was far from being well disposed to the English. He considered them as rapacious usurpers, the natural enemies, as they fatally proved to be, of Indian independence, and who, under pretence of commerce, aspired to the dominion of the country. In reply to a letter from the English, threatening, that if he assisted the nabob of Bengal, they would carry the war into his own country, he remonstrated with them on their ambitious views, and on account of the disturbances which they had created in the country; and he added, "to what can all these wrong proceedings be attributed, but to an absolute disregard of the court (of Delhi), and to a wicked design of seizing the country to yourselves. If these disturbances," he continues, "have arisen from your own improper devices, deviate from such behaviour in future; interfere not in the affairs of government; withdraw your people from every part, and send them to their own country; carry on the Company's trade as formerly, and confine yourself to your own commercial affairs." To these reasonable remonstrances, which were repeated in another letter to Major Carnac, the president and council were so far from listening, that they determined upon commencing an immediate and offensive war against him.

with, at, and ty with h vlah.

Major, afterwards Sir Hector Munro, who had arrived from Bombay with a reinforcement, was appointed to the command. His first care was to repress the mutinous spirit which had of late prevailed among the troops, and this he effected by the severe measure of blowing away twenty-four of the ringleaders from the mouths of cannon. He then advanced, with a force of 6215 Sepoys and 856 Europeans, towards the Saone, where the enemy, to the number of 40,000, with a train of artillery, were intrenched in front of the village and fort of Buxar. On the 22d of October 1764, a battle took place, in which the Indian army was completely overthrown, with the loss of about 2000 men. On the side of the British eighty-seven Europeans and 712 Sepoys were either killed or wounded. Major Munro followed up his success, though in two attempts to storm the fortress of Chanda he was repulsed with loss, and it was only through the mutiny of the garrison that it was at length taken by Sir R. Fletcher, who had succeeded to the command. Lucknow, the capital of Oude, was also occupied by the battalions of Sepoys; the fortress of Chunar was attempted, though without success, and that of Allahabad surrendered. Sujah Dowlah was abandoned in his reverses by his ally the Mogul, who concluded a treaty with the English. But he did not yet despair of his fortunes; and having received the aid of a Mahratta force, the combined armies encountered the English on the 3d of May 1765, when they were defeated; and Major Carnac, again attacking them at a place called Calpi, they were overthrown, and driven with precipitation across the Jumna. The vizir, Sujah Dowlah, seeing no hope of retrieving his affairs, resolved to trust entirely to the generosity of the English; and on the 19th of May he surrendered to Major, now General Carnac. The final settlement of terms was reserved for Lord Clive, who had arrived in Bengal, with full powers from the directors, as governor, to regulate all their complicated concerns, whether of sovereignty or of trade. It was agreed that, with the exception of Allahabad and Corah, he should still retain his dominions, which he was judged more capable of defending than the Mogul emperor, to whom they had been promised. For this concession the vizir agreed to pay fifty lacs of rupees as the expenses of the war; but he remonstrated so earnestly against the establishment of factories in his dominions, or any permission to trade free of duties, as the certain cause of trouble, that all such propositions were abandoned. He agreed not to molest Bulwunt Sing, who held the zemindaries of Benares and Gauzeepore, and who had assisted the English in the late contest, and never to afford an asylum to Meer Cossim, or the German soldier Sumroo. With regard to the Mogul emperor, he was told, that of the thirty lacs of annual tribute due to him from the subahdars of Bengal, not a rupee would ever be paid; that twenty-six lacs of rupees, which had been assigned him as the revenue of these provinces, would be continued; and that he should receive possession of Corah and Allahabad. In return, the Company received the imperial firman, dated the 12th of August 1765, granting the duannee, or the right of collecting the revenues of Bengal, Bahar, and Orissa, in which is implied, according to the laws and constitution of the Mogul empire, the right of sovereignty; and thus was this body of merchants constituted in form, as well as in substance, the rulers of a vast empire.

Company receives the sovereignty of Bengal.

Maladministration of the Company's servants.

To this issue affairs had been evidently tending for some time past. Meer Jaffier, worn out with anxiety and indulgence, died in the beginning of the year; and Jaffier, his son, was chosen his successor by the Company's servants. From each successive sovereign it was the custom of the electors to exact not only a large donation, but also an extension of power and privileges, so that the native ruler was at length left in possession of little more than a nominal authority. It was now resolved by the English that they should take upon themselves the whole charge of defending the country, and that they would only allow the nabob a few troops for the sake of parade, or for other necessary purposes; whilst, in regard to the civil government, he was to choose a deputy, with the advice of the governor and council, on whom the whole internal administration of the country should be devolved. So completely had the government fallen under the control of the English, that the accountants of the revenue could not be appointed without their approbation. In the mean time the directors were distracted by the contradictory reports of their affairs which they received from India; and it was because they were alarmed by the expensive wars so readily undertaken by their servants, by their rapacious proceedings in regard to the private trade, and by the general embarrassment of their affairs, that they had resolved to appoint Lord Clive to the supreme government of Bengal, conferring on him and a select committee of four, full authority to act and determine all matters, without any dependence on the council; of which authority they were not slow to avail themselves upon all occasions. They also sent along with him a strong representation against the rapacity and tyranny of their servants. In a letter to the governor and council they observe, "Your deliberations on the inland trade have laid open to us a scene of the most cruel oppression." "The poor of the country," they continue, "who used always to deal in salt, betel-nut, and tobacco, are now deprived of their daily bread by the trade of the Europeans, whereby no kind of advantage accrues to the Company, and the government's revenues are greatly injured." The directors accordingly issued the most peremptory instructions for the prohibition of the inland trade of salt, betel-nut, and tobacco, or rather of the monopoly held by the Company's servants, by which the country was so cruelly oppressed. The practice of receiving presents from the native rulers and princes, which had been carried to a great extent, was also prohibited. At a general meeting of proprietors, however, it was urged, in opposition to those wise and salutary restrictions, that the "servants of the Company in India ought not to be deprived of such precious advantages, which enabled them to revisit their native country with independent fortunes."

This reasoning convinced the majority of the proprietors, and a recommendation was moved in consequence to the directors, to re-consider their resolution in regard to the private trade. The governor and council were therefore instructed, after consulting with the nabob, to form a "proper and equitable plan for carrying on the inland trade." (Mill's *British India*, vol. ii. p. 217.) In other words, they were to contrive how they could oppress the country, and yet adhere to the rules of equity. This transaction places in a very strong light the corrupt nature of the Company's government. It was admitted on all hands that it was by extortion and rapine, that is, by compelling the oppressed inhabitants both to purchase and sell at prices fixed by the Company's servants, that such profits were gained, and that they were enabled to return to Europe with enormous accumulations of ill-gotten wealth. It was, indeed, as we have just seen, acknowledged by the directors, that the poor of the country were deprived of their daily bread by the trade of their European servants, who monopolized every profitable channel of business; yet, with these facts before them, we find the sovereigns of India delivering over their oppressed subjects to the rapacity of their servants, for the avowed purpose of enriching them with the spoils of the country.

Lord Clive assumed the supreme power in India in May 1765. At this period the servants of the Company, in defiance of the peremptory orders of the directors, still persisted in all the ruinous practices connected with the inland trade; and instead of abolishing these, and thus remedying some of those abuses of which he so violently complained, Lord Clive entered into a partnership for the monopoly of salt, of which large quantities were accordingly purchased, and sold for a profit of forty-five per cent., which was divided amongst three of his own dependents, his secretary, surgeon, and another friend, for whom he wished, as he expresses it, to realize a fortune. The plan of a more extensive monopoly, including salt, betel-nut, and tobacco, the chief articles of consumption in the country, was afterwards devised to be carried on exclusively for the benefit of the superior servants of the Company, amongst whom the profit, after setting apart L.100,000 per annum to the Company, was to be divided according to their rank in the service. At the time this corrupt scheme of monopoly was established, the select committee were in possession of peremptory orders from the directors for its abolition; but these orders, under various pretences, they delayed to carry into execution till September 1768.

Although the ascendency of the English had for some years been thoroughly established in Bengal, and although they were formally invested in 1765 with the sovereignty of the country, its affairs were still administered in the name of the native prince, and according to the forms and policy of the ancient constitution. Justice was still dispensed by the native courts, and by the nabob's officers; the revenues still flowed through the same channels into the public exchequer; and all transactions with foreign powers were carried on under the same authority as formerly. But such was the increasing power of the English, that the government, as far as regarded the protection of the people, was dissolved. Neither the nabob nor his officers dared to offer any opposition to their sovereign will; and the tribunals of justice, far from being a protection to the oppressed, became subservient to the rapacity of the Gomastahs, or Indian agents, employed by the Company's servants, and were converted by them into most efficacious instruments for plundering the people, and for punishing the wretched victims of their oppression if they dared to complain, and if they did not patiently submit to be fleeced and trampled upon by their foreign masters. The native tribunals had no power to afford protection, whilst the English had no legal authority beyond the presidency, either over the natives or over their own subjects; and hence the inhabitants lay entirely at the mercy of the Company's servants. Nor need we wonder that, during this period of anarchy and disorder abroad, the embarrassments of the Company's affairs continued to increase, even during the peaceable administration of Mr Verdst, who succeeded Lord Clive as governor when he left Bengal in February 1767. The Indian revenues were indeed large, but they were plundered by their servants. Lord Clive and the first adventurers were enriched by the presents or bribes of the native rulers. These they were now prohibited from accepting. "It was expedient for them," says Clive, "to find out some other channel, the channel of the civil and military changes. Every man now who is permitted to make a bill makes a fortune." In lieu of the enormous gains which accrued from the monopoly of salt and of other articles, the trade which the directors, early in 1768, sent peremptory orders to lay open, and also of one eighth per cent. of the revenues given to the governor, as a compensation for his share of the salt monopoly, the Company granted a commission of two and a half per cent. on the revenues. This sum was to be divided into a hundred shares, and to be distributed amongst the civil functionaries of the Company, and the military officers, according to their rank.

Embarr- ments the Co pany at home.

Whilst the local rulers of India were thus enriching themselves, their masters were reduced to great pecuniary distress. But, in the midst of all their embarrassments, the most flattering accounts of their affairs were circulated in Europe; and the directors and proprietors lent a willing ear to these golden promises, of which their servants were always liberal. The splendid acquisition which the Company had made of the territorial revenues of Bengal, the political events in which they had been involved, and the immense fortunes with which a few individuals had returned to Europe, confirmed the general delusion, and inflamed the impatience of the proprietors of East India stock to participate in the inexhaustible treasures of their new dominions. In pursuance of these views, the dividend on their stock was raised from six to ten per cent.; and India stock rose to 263 per cent. A higher dividend was called for, and it was in vain that the directors represented the heavy debts of the Company, and the general embarrassment of their affairs. The proprietors refused to listen to such disagreeable representations, and at a general court they voted a dividend of twelve and a half per cent. for the year 1767. The attention of government being now directed to the Company's affairs, this vote was rescinded by act of parliament, and the dividend limited to ten per cent.

In the mean time, every day's experience was refuting the fallacious expectations of annual treasures from India. So far from possessing any surplus revenue, the servants were involved in debt for the current expenses of their government; they drew largely on the directors, but they remitted little; and the whole of this complicated scheme of trade and sovereignty laboured in consequence under such pecuniary difficulties, that the directors, to avert a public bankruptcy, were compelled to apply to the bank for a loan of L.400,000, and afterwards of L.300,000. In consequence of this state of things, so different from the pleasing fancies of unbounded wealth, with which the proprietors of the Company and the country at large had been amused, great discontent and a violent clamour was raised against the Company's servants in India, who by their profusion or corruption had failed to realize those golden dreams. The situation of the Company was at length brought under the consideration of parliament by the minister, who introduced two acts for the regulation of their affairs. The first of these was intended to relieve the pecuniary embarrassments of the Company, and provided that the sum of L.1,400,000 per annum, at four per cent. should be lent to them, and that the stipulated annual payment of L.400,000 from the territorial revenue should not be required till the discharge of this debt; the dividend not to exceed six per cent. till the discharge should be accomplished, and not to exceed seven per cent. till the bond debt should be reduced to L.1,500,000. Other clauses related to the appropriation of the surplus revenue, which was always fondly hoped for, but never received. The other act, which was heavily complained of as an infringement of the Company's rights of sovereignty, as the first was said to be an invasion of their rights of property, raised the qualification to vote in the court of proprietors from L.500 to L.1000; gave two votes to every proprietor possessed of L.3000; three votes to those possessed of L.6000; and four votes to those possessed of L.10,000; and only six directors, instead of twenty-four, the whole number, were to be annually elected; and the administration of the provinces of Bengal, Bahar, and Orissa was to be vested in a governor-general with an annual salary of L.25,000, and four councillors with a salary of L.8000 each. The other presidencies were rendered subordinate to that of Bengal; and a supreme court of judicature was established at Calcutta, consisting of a chief-justice with L.8000 a year, and three other judges with L.6000 a year, appointed by the crown. The first governor-general and councillors were to be appointed by the king; and all the political correspondence of the Company with India was to be laid before the ministry. These acts received the royal assent on the 21st of June and 1st of July 1773. Under this act Mr Hastings was appointed governor-general, with General Clavering, Colonel Monson, Mr Barwel, and Mr Francis, members of council.

Af s of th arnatic

It will now be proper to revert to the affairs of the Carnatic. After the departure of Bussy from that province, and the decline of the French influence, Nizam Ali resumed his power, which he employed in dethroning and imprisoning, and afterwards murdering, his feeble brother Salabut Jung, the subahdar of the Deccan. The English having received from Shah Aulum, the Mogul emperor, a grant of the Northern Circars, a tract extending 470 miles along the coast of the Bay of Bengal, and uniting the English possessions in the Carnatic with their province of Orissa, proceeded to occupy it with a military force. On this Nizam Ali, or the Nizam as he is called by the English, made an irruption into the Carnatic, and greatly alarmed the presidency of Madras. After some operations of little moment, a treaty was concluded, by which the English agreed to pay a rent for the disputed territory, and to give him such military aid as he should require in the affairs of his government. The first operation in which this force was to be engaged was the reduction of the fortress of Bangalore, belonging to Hyder Ali, the sovereign of Mysore; and thus were the English brought into collision with that powerful chief. He was one of those bold spirits who rise to eminence in times of civil confusion. From a common foot soldier, or peon, employed in the collection of taxes, he rose to high command, to wealth and dominion, and finally to the rank of sovereign prince. The nizam, who had joined with the English against Hyder, soon became his ally, and their united forces made incursions into the Carnatic. Several battles were fought to the disadvantage of Hyder, but these were of little advantage to the English, owing to his superiority in cavalry, with which he laid waste the country to the very gates of Madras, and struck terror into the president and council. The nizam, however, wearied of the war, quitted the alliance of Hyder, which so elevated the confidence of the Madras presidency that they resolved on the invasion of Mysore. But Hyder anticipated their designs, and having by his masterly tactics artfully drawn the English army to a distance from Madras, he suddenly appeared at the head of 6000 cavalry before that city, having marched 120 miles in three days, and so alarmed the presidency, that a treaty, offensive and defensive, was concluded in April 1769, by which it was also agreed that all conquests should be mutually restored.

Destruction of the Rohillas.

At this time the Mahrattas, humbled for a time by the defeat of Paniput, now began to renew their incursions into the northern provinces, and greatly to the alarm of the subahdar of Oude, who dreaded any confederacy between them and the Rohilla chiefs or Afghans, a hardy race from the north, who having frequently aided the imperial armies, were rewarded with lands in the fertile district between the Ganges and the mountains, and to the west of the Oude territories. One of their chiefs, Nujeeb ad Dowlah, had been chosen by Abdallee Shah, on his departure from Delhi, after the battle of Paniput, as the imperial deputy. He had ruled the country with singular prudence and success, and had transmitted the government to his son, Zabita Khan, against whom a coalition was now formed by the Mahrattas and the fallen emperor Shah Aulum, anxious to regain his former power. By their assistance the emperor, in the year 1771, entered his capital of Delhi, with all the pomp of imperial dignity. Zabita Khan, unable to withstand their united attack, fled across the Ganges, leaving his fertile and flourishing territories to the devastations of the Mahrattas, to whom they afforded a rich booty. The Rohillas, alarmed by this aggression, proposed to form an alliance with the subahdar of Oude, who on his side was equally dismayed; and through the intervention of the English a treaty was accordingly concluded, offensive and defensive, by which the Rohillas engaged to pay annually to the subahdar forty lacs of rupees if he would expel the Mahrattas from their territories. He made no effort, however, to perform this service; and the Mahrattas, after retiring across the Ganges during the rains, soon returned to ravage the country, and actually extorted a sum of money from Hafiz Rhamet, chief of the Rohillas, as the price of their retreat. In 1772 they besieged the emperor, who had become weary of their alliance, in Delhi; and having entered the city, they extorted from him a grant of the two provinces of Corah and Allahabad, which he held by virtue of a treaty with the English. The subahdar was now really alarmed, and wrote the most pressing letters to the English for aid. A detachment was accordingly sent under Sir R. Barker, to assist in the defence of his territories, when the Mahrattas were recalled to their own country about the end of May 1773. The subahdar, freed from danger, now became ambitious in his turn, and was intent, either by force or fraud, upon gaining possession of the Rohilla country. With this view, in a meeting with Mr Hastings in October 1773, it was agreed that the English troops should assist in the conquest and extermination of the Rohillas, and that forty lacs of rupees should be paid for this service. In fulfilment of this iniquitous compact, the united forces, the British under Colonel Champion, entered the Rohilla territories in 1774, and on the 23d of April a battle was fought, in which the unfortunate Rohillas, after an obstinate defence, were defeated, and their gallant chief Hafiz Rhamet, slain while rallying his troops; the subahdar and his army, in the mean time, behaving with shameful pusillanimity. The whole country now lay at his mercy, and he proceeded to execute his diabolical purpose, which, as he had expressly informed the English, was the *extermination* of the Rohillas. Never, probably, says Mr Mill, were the rights of conquest more savagely abused; man, woman, and child were given up to the destroying sword, and the country was reduced to a desert.[1] At length it was agreed that Fyzoolla Khan, the remaining chief of the Rohillas, should surrender one half of all his effects to the subahdar or the vizir, and should receive in Rohilcund a jaghire of fourteen lacs and 75,000 rupees. With regard to the Mogul emperor, the twenty-six lacs of rupees hitherto paid to him as his share of the revenues of Bengal, Bahar, and Orissa, were withdrawn, because he had accepted the aid of the Mahrattas in his late attempt to regain the throne of his ancestors. He was also deprived of the provinces of Corah and Allahabad, granted to him in terms of a former treaty with the Company.

---

[1] *History of British India*, vol. iii. p. 509.

Sketch of the Mahratta powers.

On the west coast of India, the presidency of Madras was at this period involved in disputes, which ended in a war with the Mahratta states; and, with a view to the subsequent history of India, it may be necessary here to give a brief account of these disputes, and of the different Mahratta powers who had now risen to political importance in India. In the Mahratta government, as originally constituted, the sovereign or rajah was assisted by a council of eight Brahmins, the chief of whom bore the title of peshwa; and in course of time this principal minister of state, on whom devolved the duties of government, usurped all the real power, and the sovereign became a mere pageant in his hands. In the reign of the rajah Sahoo, the third in succession from the brave and politic Sevajee, the founder of the Mahratta power, this revolution had been insensibly brought about. He was a weak prince, devoted, as most princes are, to ease and pleasure, and leaving to Kishwanath Balagee the chief powers of the state. He assumed the name of Row Pundit, or chief of the Pundits, or learned Brahmins, and was invested by the rajah with a *sirpah* or robe of office, with which ceremony the peshwas have ever since been installed into their sovereign dignity. Custom or policy had so completely sanctioned the usurpation of supreme power by the peshwa, that Kishwanath had quietly transmitted his dignity and influence to his son Bajerow, who confined the rajah as a sort of state prisoner to Satarah, whilst he himself resided at Poonah, the future capital of the Mahratta states. Bow, the son of Bajerow, being slain at the battle of Paniput, the office of peshwa descended to his nephew, who had two sons, Madhoo Row and Narrain Row, the eldest of whom, Madhoo Row, a minor, succeeded to his father's dignity at his death, and the guardianship of the peshwa now devolved on Ragonaut Row, more commonly known under the name of Ragoba. The council of state, consisting of the Brahmins, now made an effort to regain their lost influence; and intriguing with the mother of the peshwa, they succeeded in sowing division between the nephew and the uncle, and finally in stripping him of his power. Madhoo died at an early age in 1772, and appointed Ragoba to be the guardian of his brother Narrain Row. But he was by the same influence again stripped of his power; and dissensions having arisen amongst the council of Brahmins, or Mutseddies as they are also called, a conspiracy was formed, which ended in the murder of the young prince, when Ragoba was again acknowledged peshwa. But he was still thwarted by the ministerial factions of the Brahmins, and the consequence was a civil war, which was carried on with various fortune, but terminated at length in the flight of Ragoba from his dominions. The presidency of Bombay had been extremely anxious to procure the cession of the island and peninsula of Salsette and Bassein, as adding much to the security and value of Bombay. But all their efforts were in vain. Ragoba uniformly refused to give them up on any terms. He had now retreated to Surat; and in the low state of his fortunes the negotiation was renewed. In the mean time the presidency were informed by their resident at Goa that the Portuguese were making preparations for the recapture of their former possessions, especially of Salsette and Bassein. No longer hesitating, they sent a force from Bombay, which carried by assault the principal fort in Salsette on the 28th of September 1774, and afterwards took possession of the island; in March 1775 they concluded a treaty with Ragoba for the surrender of these places, with other advantages; and in return they sent a body of troops under Colonel Keating, which joined his army in April, about fifty coss from Cambay; and this combined force, amounting to 25,000 men, now advanced for the purpose of penetrating to Poonah before the commencement of the rains. The enterprise failed for the present, but the armies were quartered in convenient positions; and having concluded a favourable treaty with the rajah of Gujerat, who had agreed, amongst other conditions, to advance the sum of twenty-six lacs of rupees, they prepared, with a friendly country in their rear, and greatly increased resources, to advance to Poonah the next campaign. But all these promising schemes were now frustrated by the interference of the Bengal council, which had been invested with supreme authority over the other settlements in India; and the alliance formed by the presidency of Bombay with Ragoba, the peshwa, and indeed all the other proceedings, were severely condemned by the governor-general and his council. The council at Madras were ordered peremptorily to retrace their steps, to withdraw their troops from those of Ragoba, and to give him no further aid; and they themselves proceeded to treat, by means of their own agent, Colonel Upton, with the opposite faction of the Brahmin ministers. A long and perplexed negotiation now ensued, which had nearly ended in war, when a treaty, that of Poorunder, was signed on the 3d of June 1776, by which the Mahratta ministers agreed to surrender Salsette, and the English Bassein; and the unfortunate Ragoba finally retired to Surat with only two hundred attendants.

War h the M rattas

The Mahratta power, which was spread far and wide in India, was now weakened by the same divisions which had occasioned the downfall of the Mogul empire. All indeed acknowledged their allegiance to the peshwa, the representative of Sevajee, their founder, and the nominal head of the whole confederacy. But there was no unity in the component parts of their wide-extended empire. They no longer obeyed one common impulse. The military chiefs to whom were confided the more distant provinces threw off the yoke of sovereign authority, as it was gradually relaxed; and thus, from the extension of the Mahratta power, arose various independent potentates, who, though united by a common tie, yet waged war with each other, or with the peshwa, their head, on any provocation or prospect of advantage. The most important of these independent states was, 1*st*, that of the Bhonslas, which included the extensive province of Berar, together with Cuttack, a part of Orissa; 2*d*, the province of Gujerat, broken off from the Mogul empire by Pillagee Guicowar, or the herdsman; 3*d*, the independent chiefs, Holkar and Scindia, whose names figure in the future annals of India, and who ruled over extensive territories in Malwah and in the regions bordering on the territories of Berar and Oude. Other inferior chiefs, offsets from the main stock, possessed smaller portions of territory in different parts; and the internal relations of Hindustan were thus more than usually complicated, and presented a wide field for politics and intrigue.

Oppre of the tive pr

The presidency of Madras, as well as the other two presidencies of Bengal and Bombay, were now deeply involved in the disputes of the native powers. The nabob of the Carnatic, Mahommed Ali, was incapable of ruling or of defending his country against the Mahrattas or Hyder Ali, and he relied entirely upon the English for protection and for the collection of his revenues. The disorder of his finances, already great, was much increased by the extortions of his allies, who were insatiable in their thirst of gold; and funds failing, as in Bengal, to supply their exorbitant demands, they anxiously sought elsewhere the means of relief. The kingdom of Tanjore, by the prudence of its sovereign, had enjoyed peace amidst the wars and desolations of surrounding countries; his powerful neighbours, supposing that he had amassed great wealth, mustered up against him a world of complaints, of which he readily showed the futility; and when he saw that his ruin was resolved on, that he was to be stripped of his dominions, and that he and his family were to be put to death or imprisoned for life, he pleaded for mercy with the most affecting earnestness; but avarice had extinguished every softer feeling in the breasts of his oppressors. The troops were ordered to advance; the rajah agreed to terms which he could not fulfil; and failing to pay within the exact time which the contribution imposed upon him, though he made the fairest offers, Tanjore, his capital, was taken by assault, and he and his family were delivered into the power of the nabob. This act of oppression, encouraged at first by the directors, was afterwards disapproved by a court of proprietors; and Lord Pigot was sent out as governor of the presidency, to restore the rajah, and to enforce economy and reform. The corrupt and dishonourable practices of the Company's servants were nowhere carried to a greater length than at Madras. They were in the habit of lending, or pretending to lend, money, to the nabob, at an exorbitant interest, and to receive in security assignments on the land. Paul Benfield, with a salary of some hundred pounds a year, had assignments on the lands of Tanjore to the amount of L.234,000; and Sir Thomas Rumbold, with a salary of L.20,000 a year, remitted to Europe the first year he was in office L.45,000, and in the two subsequent years a further sum of L.119,000, alleging that he had property to this amount in India before he left Europe. The lands belonging to the Company were let at an under rate to the renters, and large bribes received in return; and it was by such unworthy means that the servants of the Company so quickly acquired their enormous fortunes. Lord Pigot, in carrying into effect the views of the directors, by restoring the rajah of Tanjore, and opposing the existing abuses, was resisted by a faction. He was at last put under arrest by the members of his own council, and died after a confinement of about eight months. The authors of this violence were afterwards tried in England, and condemned to pay a paltry fine of L.1000, which was no adequate punishment for such an offence, and, to men of their fortunes, no punishment at all.

vasion the Car- tic by yder Ali.

The growing ascendency of the English naturally excited the hostility of the native powers; and Hyder Ali, irritated by their increasing influence, and by their breach of the treaty of 1769, in refusing the aid which he demanded, was now preparing to assail them with the whole weight of his power. He accordingly made peace with the Mahrattas, who formed, with the Nizam Ali and Hyder, a coalition for the expulsion of the English from India. In the year 1778, war having commenced in Europe between France and England, the presidency of Madras besieged and took Pondicherry, and Mahé, a small fort, the only remaining possession of the French on the coast of Malabar, and ranked by Hyder amongst his dependencies. Irritated by this new offence, he assembled his army, and having seized and guarded the passes of the Eastern Ghauts, through which alone the Carnatic would be invaded from Mysore, he suddenly poured down on the country below with a mighty host of 100,000 cavalry and 20,000 infantry, besides the European troops of Colonel Lally, of undoubted bravery and experience in war. Every thing gave way before this overwhelming flood of invasion; and the cavalry inundating the open plains, the inhabitants fled from their homes to the woods or the mountains, whilst the unresisted invader laid waste the country with fire and sword for many miles round Madras, and even threatened the city itself. The council were confounded by the intelligence of this sudden calamity. They were apprized on the 21st of July that Hyder had come through the pass, that he had next day plundered Porto Novo on the coast, and Conjeveram, not fifty miles from the capital. Each succeeding day brought its tale of calamity, and on the 10th of August Madras was alarmed by the approach of the enemy's horse, and the inhabitants of the open town began to take flight. The governor and council were very indifferently provided for the fearful struggle in which they were engaged. They were destitute both of money and provisions; their small force was scattered throughout the country; and, lastly, their councils were distracted by the dissensions of the civil and military authorities. Immediate action, however, was necessary, in order to avert impending ruin. The scattered troops were therefore directed to assemble at St Thomas' Mount, for the defence of the capital. Colonel Brathwaite's detachment from Pondicherry having joined the main body on the 18th of August, an express was sent to Colonel Baillie at Gumeroponda, about twenty-eight miles from Madras, directing him to repair to Conjeveram, whither the main army now advanced under Sir Hector Munro, consisting of 1500 Europeans and 4200 Sepoys, with a train of artillery, and arrived after a distressing march of four days, during which two hundred men belonging to the seventy-third regiment were left lying on the road. They found the town of Conjeveram in flames, large bodies of the enemy's cavalry advancing on both flanks, and no appearance of Colonel Baillie's detachment, which had been impeded in its march for a day by a small torrent swollen with the rains. Hyder Ali having learned from his spies the movements of the English army, abandoned the siege of Arcot, in which he was engaged, and, upon the 3d of September, the day on which Baillie's detachment crossed the river in its advance to the main body, he encamped at five miles distance in front of the English army, near Conjeveram; thus interposing between Colonel Baillie's detachment and the English forces; and he sent his son Tippoo with 30,000 cavalry, the flower of his army, and 8000 foot, with twelve pieces of cannon, to cut off the troops under Colonel Baillie, who had now arrived at a small village about fifteen miles distant from Sir Hector Munro's army, the movements of which he himself watched in the neighbourhood of Conjeveram. The troops under Colonel Baillie gallantly repulsed the repeated charges of Tippoo's numerous cavalry; and being now joined by a detachment under Sir R. Fletcher, sent to their aid by General Munro, they resisted long and bravely all the attacks of the overwhelming force by which they were surrounded; they even at times became the assailants; and an attack by five companies of Sepoys on the enemy's guns, which had begun to do great execution, spread amongst them such terror and confusion, that a seasonable and bold assault of their camp would, it is thought, have completed their route. The English commander maintained the same position till next morning, for which he has been much blamed; and when, at five o'clock, he began the day's march, he was assailed by the whole army of Hyder, who had left his ground without shifting his tents, to conceal his design. Colonel Baillie, with his handful of men, still maintained his ground in spite of the enemy's superior fire and the fury of his closer attacks, when, by an accident, the blowing up of two tumbrils, the English line was not only disordered, but the ammunition was destroyed, and the guns disabled. But though their fire was now silenced, they maintained a gallant resistance till three o'clock in the morning, when the commander, Baillie, despairing of relief, sent a flag of truce to the enemy; and the men having laid down their arms on receiving a promise of quarter, Hyder's troops rushed on them with savage fury; and, but for the humane inter-

Colonel Baillie's detachment cut off.

position of the French officers, would have massacred all who survived. After this disaster, Sir Hector Munro retreated to Madras, whilst Hyder returned to the siege of Arcot, which was taken by storm on the 31st of October, with an immense quantity of ammunition and military stores.

Progress of the war with Hyder Ali.

On the intelligence of Colonel Baillie's disaster, the supreme council of Bengal requested Sir Eyre Coote to take the command of the army in the Carnatic; and on the 17th of June 1781, the English force, consisting of 7000 men and 1700 Europeans, marched from the encampment at Mount St Thomas. Hyder now changed his plan of operations, and detached different divisions of his force against the strong places of the Carnatic. But he was so overawed by the arrival of a new commander with reinforcements, that he abandoned the siege of Wandewash, and of every place which he had invested, and retired without even disputing the passage of the Palaar. The English took the opportunity of this short respite to secure possession of Pondicherry, and to disarm the inhabitants, who had revolted. Hyder having received large reinforcements, resumed the offensive; and as the plan of the English was to march southward to protect the district of Tanjore and Trichinopoly, he resolved to oppose their advance to Cuddalore. A battle was fought on the 1st of July 1781, in which Hyder was driven from his strong position with great slaughter. On the 27th of August, another battle was fought on the ground where Colonel Baillie's disaster had occurred, when he was again defeated, after an obstinate action, in which the English suffered severely; and, some weeks afterwards, he experienced a third defeat, with greater loss than before. Far from being discouraged, this warlike prince proceeded to lay siege to Vellore, eighty-eight miles south-west from Madras. Sir Eyre Coote, though he had placed his army in cantonments, advanced to its relief, and forced his way through a strong pass guarded by the enemy's force. Returning by the same pass, he was again attacked at a disadvantage with the utmost vigour; but Hyder's cavalry suffered so severely from the English artillery that he retired with loss, while Sir Eyre Coote returned to his cantonments near Madras. Whilst the war was thus carried on with doubtful success in the eastern districts of the Carnatic, hostilities now commenced on the opposite coast of Malabar. The English detachment, by which the French settlement of Mahé was captured in 1779, had since that period occupied the fortress of Tellicherry, when it was besieged by a superior force of Hyder's tributaries. Major Abingdon, the commander, having received a reinforcement from Bombay on the night of the 7th January 1782, assaulted the enemy's lines, and threw their whole army into confusion; and he soon afterwards gained possession of Calicut. Here he was joined by Colonel Humberston Mackenzie with a thousand Europeans, and offensive operations were undertaken with vigour and success, when the army returned in May, as the rainy season approached, to its cantonments at Patacalah, in Calicut. Operations were resumed in September with the reduction of a strong fort, and the army had arrived at Palacatcherry, when, being surprised in a narrow defile, the whole baggage and ammunition was captured. A retreat to the coast was the only alternative now left to the English, in the course of which they were attacked from every thicket, both on their flank and rear, and harassed in their march, by 20,000 horse under Tippoo. Arrived at the town of Paniany, on the Malabar shore, their lines were assaulted by the enemy's force in four columns, including Lally's corps, when the forty-second regiment advancing to the charge, repelled the enemy. Tippoo now hearing of his father's death, immediately departed to take the necessary measures for securing his succession to the throne.

In the south of the Carnatic a French fleet landed 2000 men at Porto Novo early in 1782; and Tippoo having arrived with a large detachment from Hyder's army, by a brilliant and successful movement surrounded Colonel Brathwaite's force, consisting of a hundred Europeans, five hundred Sepoys, and three hundred horse, encamped upon the Coleroon, before there was the smallest suspicion of his march. Forming a hollow square, this little band held out for twenty-six hours, and repulsed every attack, until, exhausted with incessant conflict, they were at last broken by a charge of the French under Lally, and would have been all massacred as formerly, but for his vigorous and humane interference. Hyder was now enabled, by the succours he had received from France, to invest Cuddalore, which quickly surrendered, when he determined to undertake the siege of Wandewash. Its importance brought the army of Sir Eyre Coote to its relief, when Hyder still declined the hazards of a battle. The English general then proceeded to the attack of Arnee, the great depository of the enemy's warlike stores and necessaries. But Hyder outstripping the slow movements of the English force, hung upon their march; and, whilst they were galled by the attacks of his cavalry, he dexterously detached a division of his army, which carried off all his treasure from Arnee, and reinforced the garrison. In the retreat to Madras, after these operations, a regiment of European cavalry, drawn into an ambuscade by the skilful tactics of the enemy, was either killed or made prisoners. Whilst the English army was cantoned in Madras, Hyder, ever active and enterprising, was concerting with the French admiral an attack on Negapatnam, a settlement of the Dutch, which had been conquered by the English at the commencement of the Dutch war in 1780. But the French fleet having been brought to an action by the English, was prevented from co-operating in this well-planned enterprise. On the return of the army to Madras, Lord Macartney, who had arrived as governor in December 1781, now concerted a plan for the recovery of Cuddalore. But the admiral steadily refused co-operation in this, or apparently in any other operations of the land forces. On the 15th of October, one of the most dreadful tempests ever known occurred at Madras; the shore was in a short time strewed with the wreck of a hundred trading vessels, and famine raged in the city, multitudes daily perishing for want. The enemy had fortunately no information of the helpless and starving condition of the place, and considerable supplies of provisions were received from Bengal and the Circars. Hyder Ali died in December 1782, at the age of eighty years; and this event produced a great and favourable change of affairs. The Mahratta war, undertaken in favour of the claims of Ragoba to the dignity of the peshwa, which had continued since 1778, was now also concluded by a peace. The capitulation by which a British force that had invaded the Mahratta country surrendered, having been violated, the Mahrattas joined the confederacy against the English. But by the great successes of General Goddard, who, in the course of three months, from January 1780, had reduced the province of Gujerat, and completely defeated Scindia, the Mahratta general, they were now detached from the alliance of Hyder, the great enemy of the English.

Tippoo, after he joined his army in the Carnatic, undertook no operation of consequence, and he was recalled to the defence of his own territories, which were assaulted by the enterprising movements of the English armies, both from the west and from the south. About the beginning of January 1783, a force concentrated at Merjee, on the western coast of India, about 300 miles north of Paniany, under General Mathews, after storming the forts of Onore, Aranpore, and Mangalore, on the sea coast, with the slaughter of every man taken in arms, laid siege to Bednore, a rich capital of one of the Mysore provinces, which soon surrendered. A vast treasure, amounting to L.800,000 in pagodas, besides jewels, was found in this place, which immediately occasioned disputes, in consequence of the general refusing to divide the booty among the captors. He was on this account superseded by the presidency, and the command given to Colonel Macleod. But the hope of spoil appears to have corrupted the virtue of the army, which was dispersed in plundering detachments over the country, when Tippoo suddenly took possession of Bednore, making prisoners of the English garrison, which capitulated, with General Mathews, and sending all of them in irons to the strong fortresses of Mysore. Mangalore was next besieged, and taken after a gallant resistance, on the 23d of January 1784. In the mean time Colonel Fullarton, who commanded a force in the Southern Carnatic, having reduced to order the districts of Madura and Tinnevelly, and taken, in April, May, and June, the forts of Caroor, Dindigul, and Daraporam, advanced to the strong fortress of Palacatcherry, which surrendered after a short siege. Coimbetore was taken possession of in November, and every preparation was made for advancing to Seringapatam, and terminating the war by the capture of the enemy's capital, when a treaty was signed on the 11th of March 1784, upon the general basis of a mutual restitution of all conquests.

The state of affairs in Bengal under the administration of Mr Hastings now claims our attention, and we shall endeavour briefly to describe the leading transactions of that memorable period. The new council, to whose care was committed the administration of India, and of which Mr Hastings was president, commenced its deliberations in October 1774, with an inauspicious appearance of mutual coldness and jealousy, which quickly broke out into open dissension. The Rohilla war was the first subject of deliberation, and it unhappily afforded too good grounds for doubt and for inquiry. Other subjects succeeded, equally difficult to handle without offence, as they involved the governor in a suspicion of corruption in the business of the revenue. The rannee of Burdwan, a widow who enjoyed an extensive district, accused her agent the duan of corruption, and the English resident of being bribed to support or to connive at his iniquities. In the accounts that were presented to the council, a sum of 15,000 rupees was charged to Mr Hastings, and 4500 to his native secretary. Another accusation of the same nature was preferred by one of the natives, namely, that the phouzdar of Hooghly, out of the salary of 72,000 rupees which he received from the Company, returned 36,000 to Mr Hastings, and 4000 to the native secretary; and Mr Grant, accountant of the provincial council of Moorshedabad, produced a set of accounts, from which it appeared that Munny Begum, a concubine of the late Meer Jaffier, who had been appointed to the guardianship of the nabob by Mr Hastings, had received 967,693 rupees[1] more than she had accounted for; and when pressed on this subject, she told that she had given 150,000 rupees to Mr Hastings for entertainment money, which was at the rate of L.73,000 per annum, and the like sum to Mr Middleton, the agent of Mr Hastings. A still more serious charge was brought forward by the rajah Nundcomar, who had been the agent of Mr Hastings in the prosecution of Mahommed Reza Khan, duan or manager of the revenues of Bengal, whose embezzlements, as well as those of Shitabray, he now accused the governor-general of overlooking; and further exhibited the particulars of a sum of 354,105 rupees, which he affirmed that he had accepted for the appointment of Munny and Goordass to their respective dignities and powers. In answer to these accusations, Mr Hastings chiefly pleaded his dignity as governor-general. He resented them as personal insults; and when it was proposed to inquire into them by the other members of the board, he lost all calmness, and accused them of a design to supersede him in his office. "I declare," he said, "that I will not suffer Nundcomar to appear before the board as my accuser. I know what belongs to the dignity and character of the first member of this administration. I will not sit at this board as a criminal." After this he dissolved the council, in virtue of a power which he assumed as president. The majority declared the dissolution void, and continued the inquiry, when Nundcomar declared the particular sums which he himself had paid to the governor-general, gave in the names of several persons who were privy to those transactions, and presented a letter from Munny Begum, which, on examination of the seal, was found to be authentic, mentioning a gift of two lacs (L.20,000) given to the governor by herself. The governor being called upon to refund, refused to acknowledge the authority of the council, and returned no answer. At this critical stage of the proceedings, a prosecution was instituted against Nundcomar, at the instance of the governor-general and his supporters in the council, which, after some ineffectual proceedings, was dropt. But a few days afterwards, Nundcomar, at the suit of a native, was arrested on a charge of forgery; tried before the supreme court by Sir Elijah Impey and a jury of Englishmen, though it was far from clear that the court had any jurisdiction over him, being a native of Hindustan; convicted on doubtful and contradictory evidence; and finally executed, amidst the tears and loud lamentations, and even shrieks of horror, of a vast assemblage of his countrymen. This transaction, viewed in all its bearings, leaves a stain on the character of Hastings, from which it has never been relieved by the zealous testimonials of his friends. In reviewing the whole evidence and circumstances of the case, we cannot well doubt, that if Nundcomar had not accused Mr Hastings, he would never have been arrested; that his real crime, therefore, was the charge which he had brought against Mr Hastings, and not the alleged forgery; and hence that he was tried and executed because he was a witness whose testimony it was more easy to put out of the way than to confute. If this be a just inference, Mr Hastings must be considered as guilty of murder, committed under the forms of law. This, we fear, is the character which must be fixed upon him by the impartial verdict of history; and his political merits, however magnified by his admirers, cannot be accepted for a moment as any palliation of his moral guilt.

In adverting, as we shall now do, to the transactions of the governor-general with the independent or tributary states of India, it may be observed, that when he assumed the government of Bengal, the Company still laboured under great pecuniary difficulties. Disorder and waste pervaded every department of the administration; the Company's servants were intent, as we have seen, on enriching themselves rather than their masters; and the consequence was a constant want of funds for the public service. The arduous duty of providing these now devolved upon the governor-general; and the necessities of the state, if they do not justify, afford at least a key to some of those dark, and, we must add, atrocious transactions, which distinguished his administration. Bengal had been exposed to such heavy exactions that the country was exhausted; and Mr Hastings, instead of adopting economy, and improving the revenue at home, sought relief in the plunder of foreign princes, who were now laid under contribution to the necessities of the state. The rajah Cheyt Sing, who ruled at Benares, was the son of Bulwunt Sing, who had sided with the English in the war with Sujah Dowlah, subahdar of Oude, and who had been confirmed in his inheritance by the British for a fixed tribute, which was paid with an exactness not very usual in India. Mr Hastings proposed in 1778 to increase this contribution; and because the rajah pleaded poverty, and required time, he became offended, replied to him in harsh and imperious terms, refused to allow time for raising the money, and threatened military execution in case of delay. These exactions were renewed from year to year, and increased, the rajah remonstrating in the most humble terms, and being treated on account of his remonstrances as a delinquent whom it was necessary to punish. "I was resolved," says Mr Hastings, "*to draw from his guilt the means of relieving the Company's distresses.*" This was truly his object, and he accordingly found out guilt in the whole conduct of the rajah, though it was meek and humble, such as the weak naturally assume when they are in the power of the strong. At last Mr Hastings proceeded to Benares, and, notwithstanding the supplications of the rajah, craving forgiveness if he had offended, on the ground of his youth and inexperience, he ordered him under arrest; a tumult arose between the Sepoys and the inhabitants, in which the former were all put to the sword; the rajah fled; war commenced, which ended in his discomfiture, and he was dethroned. His mother, the wife of Bulwunt Sing, the faithful ally of the British, took refuge in the fort of Bidgegur; she surrendered her treasure on condition of being allowed protection for herself and female attendants. But the articles were shamefully violated; and she and her followers were plundered of their effects, and their persons subjected to the rude examination of the licentious soldiery and the followers of the camp. In a letter, Mr Hastings says, "I think that every demand she has made to you, except that of safety and respect for her person, is unreasonable." He afterwards adds, "I apprehend she will contrive to defraud the captors of a considerable part of the booty, by being suffered to retire without examination. But this is your consideration, not mine. I should be sorry that your officers and soldiers lost any part of the reward to which they are so well entitled." The ideas implied in this hint not to suffer these illustrious females to pass without examination cannot be mistaken; it is sufficient to sanction the grossest outrages; and it appears, indeed, that those to whom it was addressed were not slow to profit by the instructions given them.

---

[1] Nine lacs sixty-seven thousand six hundred and ninty-three rupees. A lac of rupees is 100,000, and a crore is 100 lacs, or ten millions. We have adopted the English mode of notation, as more familiar to the reader.

The treasures of Cheyt Sing and his widowed mother fell so far short of the expectations of Mr Hastings, that they did not even pay the expense of quelling the revolt which he had occasioned; and hence this transaction, impolitic as well as unjust, increased the embarrassments of the Company. The governor-general was therefore compelled to look elsewhere for treasures that might be profitable to the state, and he fixed his eye on the two princesses of Oude, known by the name of the Begums, the one the mother of Sujah Dowlah, the late nabob, eighty years of age, and the other his widow, and mother of the reigning nabob, who were possessed of treasures to a great amount, and of jaghires or estates, from which they maintained their own state and dignity, and the numerous families of the preceding nabobs, with a suitable train of attendants. The nabob of Oude, Sujah Dowlah, had long been unable to pay the contributions imposed on him by the English; he was in arrear to the amount of L.1,400,000, and Mr Hastings now entered into a negotiation with him for the seizure, or resumption, to use the official phrase, of the jaghires or estates which belonged to the Begums, for the purpose of enabling him to pay up this arrear. It is unnecessary to dwell on the proceedings by which a son was persuaded or compelled to aid in the spoliation of his mother and grandmother. Suffice it to observe, that Mr Middleton, the agent of Mr Hastings, in order to extort the surrender of the treasure from the princesses, ordered the zenana, the dwelling of the princesses at Fyzabad, with their numerous families, to be blockaded by troops; and these measures failing to obtain the treasures, the eunuchs Jewar Ali Khan and Behar Ali Khan, the confidential servants of the princesses, were imprisoned and put in irons, and were kept from all food, and exposed to secret tortures. These dreadful measures so wrought upon the feelings of the princesses, that the elder Begum surrendered the treasure to the amount of the nabob's bond given to the Company in 1779–1780. But another balance still remained, and new severities were applied to the ministers of the princesses, which drew from them an engagement to complete the demanded sum; but they were still tortured; and though the princesses now delivered their whole effects, even to their table utensils, and had paid upwards of L.500,000 before the 23d of February 1782, and the resident himself reported "that no proof had been obtained of their having more," yet the prisoners were not released, as they earnestly entreated. On the contrary, they were threatened with greater severities to enforce a payment of L.25,000, according to their account, and of L.50,000, according to the resident, still due on the extorted bond; and though they had now lain two months in irons, were sickly, and the officer who guarded them wrote to the resident Middleton, craving that their irons might be taken off, and that they might be allowed to walk in the garden, the nature of his orders allowed no mitigation of their sufferings; they were even threatened a few days after, on the 1st of June, with being removed, and were actually removed to Lucknow, where they were tortured in secret, of which the letter addressed by the assistant resident to the commanding officer of the English guard affords the odious evidence.[1] The cruelties to which the women and children of the zenana, composing the household of the late rajahs, were exposed, are truly shocking to humanity. They were distressed for want of food to that degree that they uttered the most piteous cries, and were even driven to the extremity of appearing publicly before the Sepoys, an exposure dreaded more than death by Hindu females of rank; and these barbarities were executed under the orders of Englishmen, a disgrace to the name, and by English officers, unwilling agents, we may well believe, in such cruelties, and whose letters describe the extreme sufferings of these helpless females. In the letter of the commanding officer, it is said, "they are in a starving condition, having sold all their clothes and necessaries, and now have not wherewithal to support nature." "Last night the women of the zenana assembled on the tops of the buildings, crying in the most

---

[1] We subjoin the two letters. The first, dated January 1782, is addressed by the resident to the officer guarding the eunuchs: "Sir,—When this note is delivered to you, I have to desire that you order the two prisoners to be put in irons, keeping them from all food, &c. agreeable to my instructions of yesterday. (Signed) NATH. MIDDLETON." Letter of the assistant resident to the commanding officer of the English guard: "Sir,—The nabob having determined to inflict corporal punishment upon the prisoners under your guard, this is to desire that his officers, when they shall come, may have free access to the prisoners, and be permitted to do with them as they shall see proper."

lamentable manner for want of food; that for the last four days they had got a very scanty allowance, and that yesterday they had got none. The melancholy cries of famine are more easily imagined than described."[1] These cruelties were continued for nearly a year, and persevered in after all the treasures were surrendered, in the vain hope that some secret hoard might still be retained, which torture would compel them to bring forth. Amongst other particulars, it may be added, that Mr Hastings received from the nabob a present of L.100,000, and craved permission to accept it from the directors, whose orders were positive against the receipt of presents. These princesses were accused of aiding in the rebellion of Cheyt Sing. But of this charge no proof beyond mere rumour was ever adduced; and, in considering all the circumstances of the case, it appears to have been invented as a pretext for despoiling them of their wealth. Mr Hastings resolved to draw from the guilt of Cheyt Sing, to use his own words, the means of relieving the Company's distresses; and the same patriotic motive seems to have dictated the accusation against the Begums. In other countries it is the poor, those who are discontented and in debt, that are turbulent; but here it is the rich, aged women of fourscore and upwards, living in affluence and splendour under the protection of the English, that are accused of rebelling against their benefactors, and of raising disturbances which could bring no advantage, but, on the contrary, were fraught with danger, to them. The directors in Europe disapproved of these proceedings against the princesses; they saw no evidence of their rebellion; and they ordered their estates to be restored, and an asylum to be offered them within the Company's territories. But the authority of the directors was little respected in India, the governor-general never wanting a pretext for disobeying their express commands. It appears, however, that some provision was afterwards made for these princesses, and for the restoration of a portion of their estates. The remaining transactions of Mr Hastings before he quitted Bengal relate to Fyzoolla Khan, who survived the ruin of the Rohilla nation in 1774; and he now entered into a scheme with the nabob of Oude for dispossessing him of his dominions. In a journey which he afterwards undertook to the upper provinces, in order to regulate the affairs of Oude, he was a witness to the desolation of the country from the exactions of his own deputies, a country which was flourishing and happy under the milder sway of Cheyt Sing.

On the 8th of February he resigned his office and embarked for England. For a more full detail of the conduct and character of Mr Hastings, the reader is referred to the work of Mr Mill, which contains a clear and well-digested view of all the dark and complicated transactions of his stormy administration. The calm and philosophical tone maintained by Mr Mill; his impartiality and love of truth and justice; and the interest which he uniformly manifests in the cause of suffering humanity, give a peculiar value to his work as a history. In his estimate of Mr Hastings' character, he seems to consider it due to truth to state the difficulties and temptations under which he acted, as to a certain extent palliating his guilt. We may remark, however, that crimes, especially those of a deep dye, are never committed except under strong temptation; and when we consider that those of which Hastings is accused are tyranny, extortion, and corruption in his high office; cruelty, the secret torture by his agents of innocent individuals, by means of famine, stripes, and imprisonment; violence threatened to females by the same agents as the means of extortion, he chiding them all the while for delay; his bargain for the extermination of the Rohillas by fire and sword; and the provinces of Oude and Benares reduced, under his unhappy rule, from contentment and prosperity to desolation; we can scarcely admit the palliations suggested by the candour of the historian. Mr Hastings was impeached, on his return to Europe, before the House of Peers, of high crimes and misdemeanours, of which he was declared innocent by a great majority of his judges. But there were various circumstances which detracted from the value and authority of this acquittal. The House of Lords, from its constitution and character, is unfit to act as a judicial tribunal. It is a political assembly, consisting of the two opposite parties, the one against, and the other in favour of the ruling power; it is thus exposed to the corrupting influence of politics, and is generally ruled, even in its judicial capacity, by the minister of the day, of which, in our more recent history, we have had ample proofs. It wants impartiality, therefore, that essential attribute of a court of justice; and there were, besides, in the present case other sources of delusion. The hope of sharing in the wealth of India had now shed its baneful influence over the land; that hope swayed all the higher classes, including the peers, who lent an unwilling ear to the charges; and this, joined to the reputed favour of King George III. for the accused, rendered the prosecution unpopular. The value of the acquittal was also lessened by the mode of conducting the defence. Mr Hastings was far from courting inquiry; on the contrary, he availed himself of all the legal subtilties of a technical defence. He constantly objected to evidence, and to the production of papers. He acted wisely, if he was guilty, in screening his conduct under legal pleas; but not so if he was innocent, because by resisting inquiry he hindered his innocence from being made clear, to the confusion of his enemies.

The mal-administration of India had now become a standing topic of declamation at home, in which all parties in parliament eagerly joined; and as the privileges of the Company were to expire after the 25th of March 1780, some new arrangement became necessary for the future government of India. Negotiations for this purpose had been begun between the ministers and the directors; and an act was at length passed in 1781, which, besides regulating the dividend, and other financial matters, more fully detailed in the account given at the conclusion of this article, of the commercial transactions of the Company, ordained that the directors should communicate to the ministers all despatches sent to India with respect to revenues, and to civil and military affairs. In 1783 Mr Fox brought forward his celebrated measure for regulating the commercial concerns of the Company at home, and for the better government of their territories abroad. He proposed to supersede the two existing courts of proprietors and directors, by vesting the whole administration of the territories, revenues, and commerce of India, in seven commissioners, to be chosen by parliament; these to have the power of appointing and of dismissing all persons in the service of the Company; nine assistant directors, being proprietors of India stock to the amount of L.2000, to be named by the legislature, and to assist in the details of commerce, and to be under the authority of the superior board. This was the substance of Mr Fox's bill, by which the government of India was transferred from the directors and proprietors to these seven parliamentary commissioners. There were, however, numerous other provisions for securing the punishment of Indian delinquents, for ensuring publicity; and all the serious abuses which had been committed by the servants of the Company were specially enumerated and forbidden. Monopolies were abolished, the land-tax was to be fixed, and it was provided that the zemindars should be reinstated in their dignities and lands.

---

[1] See *Hastings' Trial*. Letters of Captain Leonard Jaques, of 6th and 7th March 1782; also letter of Major Gilpin, dated 30th October 1782. At last the unhappy females became desperate from want, and resolved to break into the market-place; and with this view "they arranged themselves in the following order; the children in the front, behind them the ladies of the seraglio, and behind them again their attendants." They were, however, opposed in their intentions by the Sepoys. On the following day their clamours were more violent than usual. It was resolved to drive them back by force. "The Sepoys," it is added, "consequently assembled, and each one being provided with a bludgeon, they drove them by dint of beating into the zenana." (*Letter to the Resident at Lucknow.*)

In 1784 Mr Pitt introduced a new bill for the better administration of Indian affairs, the chief distinction of which from the other was the institution of a board of control, or of six commissioners, to be chosen, not by parliament, but by the king, who were not to supersede the court of directors, but only to "check, superintend, and control" all the acts and concerns which in anywise relate to the civil or military government or revenues of the Company's dominions; and with this view all letters and orders were to be submitted, before being sent out to India, to the inspection of the board, who might alter and amend these as they should deem expedient; and all communications from India were in like manner to be submitted to its inspection, and this board might even transmit orders to India without being submitted to the directors. The power of the court of proprietors was greatly diminished; a secret committee of directors was appointed; a provision was made for enforcing the disclosure by individuals of the fortunes brought home by them from India; and a new tribunal was erected for the trial of offences committed in that country. The nomination of the commander-in-chief was vested exclusively in the king; that of governor-general, presidents, and members of all the councils, in the directors, subject to the approbation of the king; which clause, rendering the approbation of the king necessary, was afterwards repealed, but he was still allowed the power of recall. The servants in India were forbidden to engage in war, to receive presents, or to disobey orders transmitted by the board; and provision was made for the restoration to the zemindars of the lands from which they had been ejected. In the year 1786 no less than three acts were passed for the amendment of this act, by one of which power was given to the governor-general to act without and even against the consent of this council; by another the military was subjected to the civil power; and by a third act, the most efficient clause of Mr Pitt's bill was repealed, which ordained every public functionary of the Company, on his return to Europe, to make a full disclosure on oath of the property he possessed. This was considered as too severe a test for the Company's servants, though it could not have affected those who acted honestly. It is the guilty only who suffer by inquiries of this nature.

Mr Pitt's bill defined rather loosely the respective powers of the board of control and the directors; and the consequence was, that they speedily came into collision. The first question which came under their joint consideration, was the settlement of the nabob of Arcot's debts. These debts were owing to the Company's servants, and it was not very clear that any equivalent had been given for them. Paul Benfield, a principal creditor, who, as we have already mentioned, acted as a junior clerk of the Company, with a salary of some hundreds a year, advanced a claim, which, with interest, amounted to L.592,000. Such transactions, therefore, were of so very doubtful a character, that they presented a *prima facie* case for inquiry; and Mr Pitt's bill accordingly provided that the court of directors "should take into consideration the origin and justice of such demands." But how great was their surprise when the board of control ordered that these debts, some of them contracted in 1767, should be all paid without inquiry, and with the addition of interest at the rate of twelve per cent. The directors remonstrated against this proceeding, but in vain. The board ordered the debts to be paid immediately, though, in a similar case in 1805, the commissioners appointed to inquire into the more modern debts of the nabob of Arcot, out of claims to the amount of L.20,390,570, allowed only L.1,346,796. These facts too clearly point to the parliamentary influence of the East India interest as the true spring of this corrupt transaction; and the same interest also prevailed in subverting the plan which Lord Macartney had adopted for the management of the Carnatic revenues, and in restoring the administration of the nabob, which was a system of misrule that impoverished the country exactly as it tended to enrich the Company's servants. This, and other differences which arose, induced the directors to question the powers of the board of control; and a declaratory act was in consequence brought forward by Mr Pitt explaining these powers, according to the interpretation, not of the directors, but of the ministers. This act vests the real power in the board of control, though in practice a large share both of power and patronage has been still left to the directors.

Lord Cornwallis assumed the government of India in September 1786. He had ample instructions both from the court of directors and the board of control; and he carried into effect several very important reforms, both in the management of the revenue and in the administration of justice, whilst in his arduous contests with Tippoo he fully maintained the honour of the British arms. To the native and dependent powers his conduct was moderate and just; and one of his first cares was to relieve the nabob of Oude from the extortions of the former government, by which the country was impoverished, and in many places deserted and desolate. The wretched condition of the people is described in strong terms by Lord Cornwallis; and he now reduced the annual payment of the nabob from eighty-four lacs, equal to L.940,000, to fifty lacs, and left in his hands the internal government of his country. But the mind of the governor-general was soon engrossed by other and more momentous concerns. Tippoo, who naturally viewed with jealousy the growing ascendency of the British, began to take hostile measures. He descended from the Ghauts with a large military force, and spread alarm along the whole western coast. At length, throwing off all disguise, he commenced an attack on the rajah of Travancore, an ally of the British, and invaded his dominions. Lord Cornwallis now prepared for war. He formed a league with the Mahrattas and the nizam, who agreed to aid with a military force in the approaching contest. The plan of the campaign was, that a division of the British under General Meadows should penetrate through the province of Coimbetore into the heart of the Mysore country, whilst General Abercromby should reduce the territory of Tippoo on the coast of Malabar, and Colonel Kelly remain to protect the Carnatic from the ravages of the enemy. The division of General Meadows marched from the plain of Trichinopoly on the 15th of June 1790, and all the fortresses in the line of its march, namely, Caroor, Daraporam, Erroad, Coimbetore, Sattimungul, Dindigul, and Palacatcherry, were necessarily occupied, by which the army was divided into three bodies, one at Coimbetore, another at Sattimungul, sixty miles distant, and a third at Palacatcherry, about thirty miles in the rear. In this situation, Colonel Floyd at Sattimungul, was attacked and forced to retreat with loss, and with great difficulty effected a junction with General Meadows. The sultan now resolved to attack, and, if possible, surprise the English chain of posts. He retook Erroad; approached Coimbetore, which had been previously reinforced; and afterwards turned to Daraporam, which capitulated. Colonel Maxwell with his corps being ordered to invade Barramahal, the sultan, leaving part of his army to watch General Meadows, hastened to attack, and, if possible, to cut off this detachment. The British, and a regiment of cavalry, inveigled in a defile, were driven back with great loss. But the able dispositions of Colonel Maxwell frustrated any further attempts on the part of Tippoo; and he soon afterwards effected his junction with General Meadows. The sultan having thus succeeded in defeating the original plan for the invasion of Mysore by a rapid march into the Carnatic, arrived before the English depôt of Trichinopoly, whither he was followed by General Meadows, and afterwards to Trincomalee; and thus ended this indecisive campaign. The Malabar country was in the course of three weeks completely reduced under the British power by the force under General Abercromby.

Lord Cornwallis now resolved to assume the command of the army, and, advancing to the Ghaut Mountains in the direction of Velore, to lay siege to Bangalore, and thence to proceed against Seringapatam, the capital of Mysore. Early in February 1791 he was on his march to Velore; and on the 5th of March the English army sat down before Bangalore, which on the 21st was carried by assault; an event which, fixing the seat of war in the enemy's territory, proved decisive of its success. On the 28th Lord Cornwallis began his march from Bangalore, in the course of which he was joined by the nizam's force, amounting to 10,000 cavalry, which were found to be of little service. On the 13th of May the British army reached Anika, about nine miles from Seringapatam, destitute both of provisions and of draught cattle. It was the intention of Lord Cornwallis that General Abercromby, ascending through the passes of the Ghauts from Malabar with the Bombay army, and the Mahratta force under Purseram Bhow, should penetrate into the centre of the sultan's dominions, and co-operate with the main army in the attack of the capital. Of the movements of this force Lord Cornwallis had received no intelligence; and having defeated Tippoo's army in the vicinity of Seringapatam, he now resolved, as the Cavery was too large to be crossed in safety, to ascend to a ford at Cansambaddy, eight miles above Seringapatam. In this march the troops were exposed to unexampled hardships; to disease, from scarcity of food, and of the means of conveyance owing to the complete failure of the draught cattle; and all their calamities were aggravated by the small-pox, which raged in the camp. It was now apparent that the army could only be saved by a timely retreat, and by the sacrifice of the battering train and all the heavy equipments. On the 21st of May, accordingly, the retreat was begun; and immediate orders were sent to General Abercromby to follow the same course, which occasioned a similar destruction of the battering train and other heavy equipments. So great was the destruction, that the ground on which the army of Lord Cornwallis had encamped at Cansambaddy was covered to an extent of several miles with the carcasses of the cattle and horses; and the last sight of the gun-carriages, carts, and stores of the battering train, left in flames, was the melancholy spectacle which the troops beheld, as they passed along, on quitting this deadly camp.

Fortunately for the British army, it was met, before the end of the first day's march, by the allied force of the Mahrattas, under Purseram Bhow and Hurry Punt. Every despatch sent to these chiefs had been intercepted by the vigilance of the enemy, and they were astonished when they learned the disasters which had been occasioned by their delay. Their arrival, which evinced their sincerity in the cause, produced general satisfaction in the British camp, and a conviction, that the ruin of the sultan, though delayed, was now certain and inevitable. Tippoo, overawed by this formidable confederacy, made overtures to Lord Cornwallis for the conclusion of a peace; but that nobleman would listen to no terms of accommodation in which his allies were not included, and which were not preceded by the release of all the prisoners that had been detained during the present and former wars. The arrival of the Mahratta troops, amounting to 32,000 cavalry, however fortunate it might be deemed at the critical moment in which it happened, brought little additional effective strength to the allied army. Their battalions were unwieldy, irregular, and ill disciplined; their force had declined as much as Tippoo's had advanced in improvement; and they were at present far inferior to those troops who, under Madha Row, had defeated Hyder Ali in 1772.

Treaty with Tippoo.

The combined armies amounted to about 80,000 men; and if to these be added four times the number of camp followers, brinjarries or grain carriers, and the carriage department, the number of strangers to be subsisted in the Mysore alone could not be much less than half a million. That no distrust, jealousy, or counteraction, should have disturbed the combined operations of such an immense multitude, must be ascribed to the unexampled moderation and the vigilant conduct of the commander-in-chief. Such a vast army had never taken the field in India in the British cause; yet no murmurs, nor even the slightest appearance of distrust, were ever manifested by the allies towards the British commander. They submitted with implicit confidence, not only to his arrangements in carrying on the war, but, which was little to be expected among allies so much alive to their particular interests, they acquiesced in his distribution of the conquered territories, with a deference which evinced the most perfect confidence in his liberality and justice. With these coadjutors, Lord Cornwallis set out in the month of June towards Bangalore. He determined on a new and circuitous route northward by Naggemungulum; and in order to facilitate the communication between the Mysore and the Carnatic, from which the supplies were chiefly to be drawn, the various hill forts which command the different passes were to be reduced. Amongst these forts, remarkable for natural strength, Oossoor, Rayacottahud, and Nundydroog, were assaulted and taken. There remained Kistnaghery, Savendroog, and Ootradroog, on the first of which an unsuccessful attack was made. Savendroog consists of a vast mountainous rock, which rises above half a mile in perpendicular height above its own base, which covers a space of eight or ten miles in circumference. This rock is surrounded by walls on every side, and defended by cross barriers wherever it was deemed accessible. Towards the upper part, the immense pile is almost precipitous, and has the further advantage of being divided on the top into two hills, which have each their defences, and are capable of being maintained independently of the garrison in the lower works. To the siege of this tremendous fortress, Lieutenant-Colonel Stewart, commanding the right wing of the main army, was appointed. The attempt commenced on the 10th of December. In three days a practicable breach was effected, and both hills were stormed, with only one private soldier wounded. Colonel Stewart's detachment marched in two days against Ootradroog, another fortress strengthened by five different walls, and so steep as to prove tenable by a handful of men against the largest army. After the refusal of a summons to surrender, the lower fort was escaladed with such rapidity, that the killadar requested a parley. But on some appearance of treachery in the upper fort, the assault was ordered; some of the gates were instantly broken, others were escaladed, till five or six different walls on the face of the steep rock were passed, when the troops gained the summit, and put the garrison to the sword. The assault of these fortresses, which had hitherto been deemed impregnable, made so serious an impression on the enemy, that in none of the hill forts, however inaccessible, did they afterwards make any attempt to resist the British troops. Hence the strong mountainous country between Bangalore and Seringapatam, which, studded with forts, had so much checked all communication, now afforded security to the convoys. These henceforth reached the army without opposition; and the supplies of warlike stores of every description were as completely re-established as they had been at the beginning of the last campaign.

To prevent any future scarcity of the great article of grain, the commander-in-chief encouraged the native brinjarries, a class of men of whom we have already given some account. They form a peculiar caste, who are traders in grain, and whose utility is so universally acknowledged that they are regarded as neutral in war, and are not hindered by either of the belligerents from carrying supplies of grain to the other. By constantly affording regular payment and a good price to these native merchants, they supplied the camp to an extent far exceeding what could ever be furnished by the most extensive carriage establishment. With such ample supplies, preparations were made for the commencement of the campaign. The Bombay troops, destined again to act from the same quarter as last season, marched from Cananore, and arrived at the foot of Poodicherrim Ghaut in the month of December. Several weeks of hard labour were necessary to drag the artillery through woods extending nearly sixty miles, and over mountains of immense height, when this force, consisting of 8400, with all their baggage and artillery, and a supply of rice for forty days, penetrated with safety into the Mysore frontier, which they reached on the 22d of January 1792. To facilitate the return of the army, batteries were constructed to defend the pass; a precaution which, if the sultan had not overlooked, he would have suffered no invasion on this quarter of his dominions.

The Mahratta forces, after taking the important post of Simoga, which, however, was soon retaken by one of Tippoo's generals, and defeating Reza Saib and nearly 10,000 of the sultan's cavalry, effected their junction with the Bombay army, though somewhat later than the appointed season. The main army under Lord Cornwallis, being joined at Ootradroog by the battering train under Colonel Duff, and the last convoys under Colonel Floyd, and also by the army of the nizam, was at last fully prepared to resume its enterprises against the sultan, who, in imitation of his father when formerly attacked in 1767, had encamped with the whole of his force in a strong position under the walls of his capital. On the 1st of February the allied armies marched from Hooleadroog, the last hill fort of which they had taken possession, lying at the distance of only forty miles from Seringapatam. The last march, of the 5th of February, stretched across a range of barren hills lying six miles north-east of Seringapatam. From these heights a view of the whole city was presented to the army, and the encampment of the sultan under its walls. Every circumstance was eagerly viewed by our troops; and, from the sultan's position, it was evident that he meant to defend the place in person, and to make it the grand concluding scene of the war. The camp of the allies was pitched on the north side of the island. The British formed the front line, and extended along both sides of the Lockany, a small river which at this place flows into the Cavery. The reserve was placed a mile in the rear, to afford space for the baggage and stores; and the nizam and Mahrattas were stationed still farther in the rear, to prevent interference with the British camp.

Opposite to Seringapatam, on both sides of the river, a large space was enclosed by a bound hedge, which marks the limits of the capital, and afforded a refuge to the peasants during the incursions of cavalry. Tippoo's front line, or fortified camp, lay immediately behind this hedge, where it was defended by heavy cannon in the redoubts, and by a large field train advantageously placed. In this line there were a hundred pieces of artillery, and in the fort and island which formed his second line there were above thrice that number. The redoubts on his left were intrusted to two of his best officers, and a corps of Europeans commanded by Monsieur Vigie; Sheik Ansar, a general of established reputation, was stationed on the right, and the Carighaut Hill; whilst Tippoo himself commanded the centre, having his tent pitched in the sultan's redoubt. The fort and island, where there was the greatest number of guns, were intrusted to Syed Saib and other commanders. The whole army of the sultan thus stationed consisted of about 50,000 men.

The whole attention of Tippoo, on finding that he could not keep the field, was directed to the fortifying of this camp, and the strengthening of his defences in the fort and island, under the idea that the want of supplies, or the approach of the monsoon, would again force his enemies to abandon their enterprise, as they had been compelled to do on former occasions. In these circumstances, Lord Cornwallis resolved on the bold enterprise of a night attack on the enemy's fortified camp. Accordingly, on the evening of the 6th of February 1792, just after the troops had left the parade, orders were issued for an attack at seven o'clock, of the enemy's camp and lines, in three divisions. The British camp was left to be defended by the artillery and cavalry; whilst the assailants, who were instantly furnished with guides and scaling ladders, marched in perfect confidence that muskets alone, for they were unprovided with artillery, would prove the fittest instruments for opening their way into the enemy's camp. The allies of the British, to whom this design was not communicated till after the columns had marched, were struck with surprise and consternation on learning that Lord Cornwallis, like a common soldier, was personally to lead the attack on the enemy's fortified camp. They not only deemed his success impossible, but they dreaded that the ruin of the allied army would be involved in the attempt.

The three columns into which the assailants had been divided marched with equal intrepidity to execute the different objects which had been allotted them. Many obstacles intervened; various conflicts ensued in different quarters of the enemy's camp; each party was uncertain of the fate of the rest, and each individual of his associates. The return of day at last removed their fears and uncertainty, by disclosing the complete success which had crowned their exertions throughout the whole line of attack. The enemy having lost all their positions on the north side of the river, where the siege was to commence, and almost the whole of the island, every material object of the assault was secured. On the side of the British, the loss, though considerable, amounting to 536 men, was small in proportion to the importance of the victory and the disasters of the enemy, of whom it afterwards appeared that 4000 had been slain in the various conflicts during this night of enterprise, danger, and death, besides a much greater loss which was suffered by desertion.

The British army, now in possession of the island and town of Seringapatam, and flushed with the pride of victory, immediately began to make the necessary preparations for the siege of the fortress or citadel. The mosques and religious buildings on this enchanting island, watered by the Cavery, and the seat of perpetual verdure, were converted into hospitals for the wounded and sick; and the trees, now for the first time assailed by the axe, furnished materials for fascines and gabions for the approaching siege. The sultan was now seriously alarmed; and after vain efforts to retard the siege by a distant cannonade, which occasioned little injury, he at last began to meditate seriously on the necessity of a peace. In order to smooth the way for his overtures, he previously liberated two British officers, who had been detained contrary to capitulation in Coimbetore. These officers, who had not been treated with his usual rigour, he loaded with presents, and made the bearers of a letter to Lord Cornwallis, suing for peace. He at the same time had recourse to another daring expedient, which might have been attended with fatal consequences. He despatched a small party of horsemen in the night to surprise the tent of Lord Cornwallis, and to put him to death. The party were detected by their eager inquiries after the commander's tent; and being fired upon, effected their retreat. The Bombay army, which was at this time approaching, effected its junction with the main army on the 16th; and on the second night after this event the trenches were opened, and a parallel formed within eight hundred yards of the north face of the fort. General Abercromby, stationed on the southern quarter with a strong detachment, was ordered to cannonade it from the heights. This attack being directed against the weakest part of the fort, occasioned the greatest alarm. Tippoo himself, therefore, at the head of his troops, marched to dislodge the general. Being supported by the guns of the fort, he maintained the action for the whole day; but towards evening he was forced to retreat. This desperate effort was the last that Tippoo made for his defence. His affairs hastened to a crisis; cabals were formed by the chiefs, and his troops deserted in multitudes during the night. He saw his capital blockaded on every side by a powerful army, plentifully supplied with provisions, which must infallibly reduce his troops by famine, should they even prove successful in repelling its assaults; even his last hopes of relief from the monsoon, and the swelling of the river, were thus finally cut off.

On the 23d of February, therefore, the preliminaries of peace were signed by Tippoo, amidst the conflicting emotions of pride, resentment, and fear; and orders were issued to the troops on both sides to cease from further hostilities; a stipulation of which the dread of an immediate assault alone enforced the observance.

By the terms of this treaty, Tippoo was compelled to pay, as an indemnification for the expenses of the war, three crores and thirty lacs of rupees, at two instalments, the first to be advanced immediately, and the second at the end of four months. Other articles of this instrument provided further, that all the prisoners taken from the allied powers, from the time of Hyder Ali, should be unconditionally restored; that no less than one half of his territories should be ceded to the allies, and that two of Tippoo Sultan's three eldest sons should be given as hostages for the due performance of the treaty.

About noonday on the 26th, the young princes, the one eight, and the other ten years of age, mounted on their elephants richly caparisoned, and attended with a splendid retinue, left the fort, the walls and ramparts of which were crowded with spectators. Amidst the vast multitudes whom curiosity or affection had drawn out to witness this scene, Tippoo himself was beheld standing above a high gateway, through which, as they passed, the princes were saluted by the guns of the fort; a compliment which they again received as they approached the British camp. They were seated in silver howdahs, attended by their father's minister and a numerous retinue. The procession which they thus formed was equally grand and interesting. It was led by several camel harcarras and standard-bearers, carrying green flags suspended from rockets, followed by one hundred pikemen, with spears inlaid with silver. Their guard of two hundred Sepoys, and a party of horse, brought up the rear.[1]

Lord Cornwallis, attended by his staff, and the principal officers of his army, and a battalion of Sepoys, received them at the door of his tent, and embraced them with a cordiality and tenderness that resembled parental affection. The manners, dress, and appearance of the young princes themselves, formed an interesting spectacle to their European hosts. They were clothed in red turbans and long white muslin gowns, everywhere sparkling with emeralds, rubies, and pearls. Thus attired, the young princes, immediately after their reception, were seated on each side of Lord Cornwallis, when Gulam Ali, the head vakeel of Tippoo, thus addressed the British general:—"These children were this morning the sons of the sultan my master; their situation is now changed; they must look up to your lordship as their father." The scene now became most interesting; the faces of the children brightened up; and not only their attendants, but all the spectators, were delighted to observe, that any fears they might have harboured were removed, and that they would soon be reconciled to their change of situation. After being regaled, in the eastern manner, with ottar of roses and betel-nut, the princes were presented each with a gold watch from Lord Cornwallis, a gift from which they seemed to receive great delight. Lord Cornwallis next day visited them in their tents; and each of them made him a present of a Persian sword, and he made them a present of some elegant fire-arms in return.

Some difficulty occurred in adjusting the terms of a definitive treaty. When the territory of the Coorga rajah, in particular, was required, the demand seemed unexpected both by the sultan and his ministers, and was at first received with astonishment and disdain. This rajah was considered as a chief cause of the war, and Tippoo, therefore, wished to crush him. Lord Cornwallis seemed equally resolute in his defence; for he again manned the works, and threatened to recommence the attack. Happily, his stock of provisions was ample; and although upwards of 400,000 strangers and half a million of cattle were daily to be fed, the supply was sufficient for the whole; whilst one million sterling of the fine imposed on Tippoo had already been paid. The firm determination of the commander-in-chief, aided by these circumstances, which were not unknown to the sultan, damped his resolution. His resentment cooled, and he finally acceded to the terms agreed upon, and copies of the treaty were delivered to the confederated powers.

Nabob of Oude.

From the conclusion of this treaty, dictated to Tippoo by an English army at the gates of his capital, no great event occurs in the history of India till the renewal of the war in 1798, during the administration of Lord Mornington. The affairs of the nabob of Oude, and his dominions, were both hastening to ruin under his own mismanagement and that of the English; and, with a full knowledge of this, his sway was now extended over the district of Rampore in the Rohilla country, granted to Fyzoolah Khan, the Rohilla chief, who survived the ruin of his nation, and who died at an advanced age in 1794, leaving the territory of which he was ruler in a high state of cultivation. On the pretence of the usurpation of the reigning prince, who had made his way to the throne by the murder of his brother, the British troops made war on the Rohillas, and defeated them. The treasures of the late chief, amounting to 332,000 gold mohurs (L.607,000), were given to the vizir or ruler of Oude, who returned twelve lacs of rupees (L.127,000) to the British army; ten lacs of revenue were assigned for the support of the lawful prince, now dethroned; and the unhappy country was handed over to be pillaged and destroyed by the vizir and his English allies. He soon afterwards died, and was succeeded by Mirza Ali or Vizir Ali, who was set aside by the English on the reputed spuriousness of his birth, and Saadut Ali, the eldest surviving son of Sujah Dowlah, was placed on the throne. The annual subsidy to the English was at the same time raised to seventy-six lacs of rupees.

---

[1] For the substance of this account, see Major-general Dirom's narrative of this campaign.

Transactions at Madras.

The Nabob Mahommed Ali, the first ally of the English, died in 1795, at the age of seventy-eight, and was succeeded by Omdut-ul-Omrah, his eldest son. Lord Hobart, governor of Madras, now determined to interfere with a strong hand in the affairs of the Carnatic, and, if possible, to rescue the country from the merciless exactions to which it had been exposed. These evils he describes to arise from the numerous loans of the English to the nabob. "Some of the principal houses of business in Madras," he observes, "or even some of the Company's servants, enter into an agreement with the nabob for the payment of sums which may have become due to the Company's treasury. They receive a mortgage upon a portion of the territory. To render this availing, they stipulate for the appointment of the manager of the territory. It is also requisite to establish an understanding with the military commanding officer of the district. And then the chain of power is complete. Then the unhappy ryots (husbandmen) are delivered over to the uncontrolled operations of men who have an interest in nothing but exacting the greatest sums in the shortest time; of men hardened by practice, and with consciences lulled to rest by the delusive opiate of interest upon interest." Lord Hobart prepared to remove these evils by assuming the management of the nabob's revenues, and, in short, the internal government of the country. But these arrangements being opposed by the supreme government, were not at this time carried into effect.

Invasion of the nizam's territories by Scindia.

The British had now acquired an undisputed ascendency in India. The other ruling powers were the Mahrattas, under the peshwa and Scindia; the nizam of the Deccan, an ally and dependent of the British; and Tippoo, so greatly humbled and weakened by the late war as to be no longer formidable. Each of these powers was jealous of the others, though the balance of power was chiefly endangered by the ascendency of the British. The nizam, after the conclusion of the war with Tippoo, was extremely desirous of forming an alliance with the English as a defence against the encroachments of the Mahrattas, who, he was well informed, were planning an inroad into his dominions, for the purpose of levying the contribution of the chout, amounting to one fourth of the land revenues, to which they laid claim, on condition of guaranteeing the remainder. The English, though bound to the nizam by a treaty offensive and defensive, refused to join in any alliance against the Mahrattas, who, under the command of Dowlut Row Scindia, Mahadjee Scindia being lately dead, now invaded the nizam's territories, and having defeated his army and shut him in one of his fortresses, dictated a treaty of peace to him, by which he ceded a country yielding thirty-five lacs of revenue, paid them a large sum, and gave up his minister as an hostage for the performance of these conditions.

Admini tration Lord W lesley. War wi Tippoo, 1798.

Lord Mornington arrived in Calcutta as governor-general in May 1798, and he had scarcely been a month in India when he ordered "an immediate attack" on Tippoo Sultan, not upon any tangible ground of offence, for it was not asserted that he had violated a single article of the last treaty, but upon vague accusations of alleged hostility and correspondence with the French, against whom the new governor-general had so thoroughly imbibed the prejudices of the day, that the mere suspicion of such a connection seemed sufficient to justify an "immediate attack" on his once formidable but now humbled power. Tippoo, as the event too fatally for himself proved, was unprepared for war. Stripped of half his dominions and revenues by the last treaty, he had not the means of maintaining war; whilst the power of his rivals was formidably increased, and their numerous and well-appointed armies, and extended dominions, justly excited the dread and the jealousy of the native powers, and probably of Tippoo amongst others. But the humbled king of Mysore was no longer himself an object of jealousy and dread; the last treaty was dictated by a victorious army at the gates of his capital; its terms, from his unprovoked aggression of the British allies, were necessarily severe, and no circumstance had since occurred to justify the British in exacting additional securities from the fallen prince. That he was the enemy, the natural enemy, to use a common and much abused phrase, of the foreigners who now trampled on the independence of India, no one can doubt. They were his rivals in the great contest for the dominion of the country; they were the gainers, he the loser, in this game of ambition; and who can doubt, that in such a situation he should feel the stings of disappointed pride, and that he should hate the English, as it was clear that they hated him, from their continual and unmeasured abuse of him? But whatever might have been the feeling of Tippoo towards the British, certainly no hostile act was proved against him, nor any thing beyond vague surmise. The governor general, finding he could make no immediate attack on the sultan, secretly proceeded with his military preparations, and as these advanced, his surmises were converted into certainty, and he rose in his demands. His views were at first limited to the establishment of an English resident at Seringapatam, and to the dismission and perpetual exclusion of all the French from his armies and dominions. He now insisted, in order to prevent all communication by the sea-coast with the French, on the cession of the maritime province of Canara, and the payment of a considerable sum of money by Tippoo to defray the expense of the military preparations for his own destruction. In answer to these arrogant demands for additional securities, Tippoo referred to the existing treaty between the parties, and expressed the greatest surprise at the measures of precaution and self-defence adopted by the Company. The governor-general construed this reply into a new proof of hostility, and accused him of prevarication, falsehood, and criminal evasion; and Tippoo, alarmed, as he well might be, by the great military preparations of his known enemies, despatched two natives along with a French officer on a mission to the executive directory of France. The governor-general now resolved to commence the war, and to raise his terms; to exact as the price of peace the cession of one fourth, and, if any decisive military advantage should be obtained, one half, of Tippoo's whole dominions, and the payment, in addition, of two crores or twenty millions of sicca rupees, equal to L.2,250,000. Three armies were now assembled for the invasion of Mysore, namely, the army of General Harris at Velore, which was to advance from the east; the army of General Stuart at Cananore, on the western coast; and a force under Colonels Read and Brown in the southern districts of the Carnatic. On the 9th of March the army made its first united movement, and in the course of its advance experienced no serious resistance. The greatest obstacle to its progress arose from the want of provisions, and an adequate supply of carriages.

All these difficulties were, however, overcome; and on the 5th of April the united army took up its position for the siege of the capital, exactly one month after it had crossed the frontier. Tippoo made a last and vain appeal to his enemies. But the governor-general was now resolved on the conquest of the country. His views expanded with the success of his arms; and towards the end of April he declared his opinion, that "it would be prudent and justifiable entirely to overthrow the power of Tippoo;" and "that the power and resources of Tippoo Sultan should be reduced to the lowest possible state, and even utterly destroyed, if the events of the war should furnish the opportunity." On the 3d of May a practicable breach was made, and next day the assault took place, which, notwithstanding an obstinate defence, was successful at every point. The assailants, carrying every thing before them by the impetuosity of their attack, met over the eastern gateway; and the palace, in which were the family of the sultan and a body of his most faithful adherents, was the only place within the fort that still held out. From motives of humanity, the English were extremely averse to expose its inmates to the horror of an assault, and they at length succeeded in effecting its peaceable surrender. Major Allan, who was admitted to the apartments of the young princes, endeavoured, by every expression of tenderness, to soothe the agitation of their minds. They were conducted to the presence of General Baird, who assured them, in the kindest manner, of protection from violence and insult, and gave them in charge to two officers, to be conducted to the head-quarters of the general. The sultan lost his life in the defence of his capital, and his body was found amidst heaps of slain. He had been repeatedly wounded in the course of the conflict; and his attendants having placed him in his palanquin, he was observed by the English soldiers who first entered. One of them, in attempting to pull off his sword-belt, which was very rich, received a wound from the sultan, who still held his sabre in his hand; on which, putting his musket to his shoulder, he fired, and the sultan, receiving the ball in his temple, expired.

Def and dea of Tip

The kingdom of Mysore, which was now in possession of the English, was partitioned amongst the allied powers. The English and the nizam received equal portions of the conquered territory, and a smaller portion was reserved for the Mahrattas. The possessions of the sultan on the Malabar coast, the district of Coimbetore and Daramporam, the whole country which lay between the Company's territory on the eastern and western coasts, the passes of the Ghauts, the district of Weynaad, and the city and island of Seringapatam, were surrendered to the British, who now occupied the country from sea to sea. A territory of equal revenue was ceded to Nizam Ali, in the districts of Gooty, Gurrumcondah, and the tract of country which lies along the line of the great forts of Chittledroog, Sera, Nundydroog, and Colar, with the exception of the forts. The territory ceded to the Mahrattas, from one half to two thirds of the other portions, was to include Harpoonelly, Soonda above the Ghauts, Annagoody, and some other districts; also the territory, though not the fortresses, of Chittledroog and Bednore. The remaining portion of the sultan's territories was erected into a separate state, over which was placed a descendant of the ancient rajahs, who had been retained in confinement by Tippoo and his father; with such provisions, however, as really vested the whole powers of the new state, both civil and military, in the hands of the English. The treasures of Tippoo, amounting to sixteen lacs of pagodas (L.640,000), and his jewels, valued at L.360,000, were divided amongst the troops. The fortress of Velore was commodiously fitted up for the future residence of the royal family, to whom, and to all Tippoo's confidential servants, such pensions were assigned, that they were no less surprised than gratified by the liberality of the conquerors.

Arbitrary conduct of the Company to the native powers.

The transactions of the East India Company's servants with the native princes of India consisted in continual encroachments, until at length they engrossed both the civil and military powers of the state, and reduced the sovereign to a mere pageant. The first step was the subsidiary alliance, by which they placed a resident at the court of the native prince, with a body of British troops for the defence of his dominions. Thus they acquired the power of the sword, and might at any time also usurp from the native ruler the civil administration of the country. Under this system of progressive ascendency, the native princes were seen in every stage of degradation. A treaty had been recently concluded with the nizam, by which he agreed to dismiss a force under French officers, which he had hitherto maintained, and to receive and to pay a British force in its stead, whose aid, it is certain, was absolutely necessary for the defence of his dominions. This was therefore the commencement of British ascendency in that country. In Oude the military power had long been vested in the Company; and the country was languishing, and in some parts reduced to desolation, by the mal-administration of the nabob, and the still increasing extortions of his English allies. The disorder of the finances, and the oppression and complaints of the people, always afforded a pretext for interference; and though the affairs of Oude, as the directors supposed, had been permanently settled by a definitive treaty which Sir J. Shore concluded at Lucknow in 1798, by which they expressed their satisfaction that not merely an immediate payment of twelve lacs of rupees had been secured, but an annual increase of upwards of twenty lacs, yet it was now resolved by the Marquis Wellesley to overturn all these arrangements, and to take from the nabob the whole civil and military power of the country in form, as had already been done in substance. The governor-general, that he might save appearances, and avoid any recourse to actual force, was desirous to obtain from the nabob an abdication of his sovereignty. But he manifested the strongest aversion to relinquish his dignity and power. He reasoned, he remonstrated, he entreated in the most humble terms; and though he was in the power of the British, he refused, in defiance even of threats, to commit such an act of flagrant dishonour as to sign away the inheritance of his fathers. The governor-general was highly incensed at this display of dignity by the fallen prince, which somewhat disconcerted his plans, and the nabob was alternately cajoled and threatened. He still remained firm, and repelled every proposition for the voluntary resignation of his dignity. At last a middle course was adopted. The annual contribution imposed on Oude by the treaty of Sir John Shore was seventy-six lacs, the additional expense of the troops which he was now to maintain was 5,412,929, together 13,012,929 rupees, equal to L.1,463,953 sterling. It was now agreed that he should cede in perpetuity to the English, a territory yielding revenue to this amount, which was not much less than two thirds of his dominions, and that he should still continue the nominal sovereign of his remaining possessions. A treaty to this effect was accordingly concluded. In this transaction we may trace throughout, the two parties, in their distinct characters of the oppressor and the oppressed; on the one side fear, supplication, humility, grief of heart; on the other coldness, cruelty, haughtiness, all the harsh features and austere policy of absolute power; and we have given this brief sketch as an illustration at once of the decided ascendency of the British in India, and of their policy in using or abusing that ascendency for the overthrow of the native powers. By the same authority, the nabob of

Surat, the nabob of Arcot, against whom a lucky discovery was made of a criminal correspondence with Tippoo, and the rajah of Tanjore, were all dethroned, and pensions assigned them for their support. The badness of the government was still urged as a reason for these measures; and if this was the motive, and the increased happiness of the people the consequence, they merit praise instead of blame. Yet some suspicion must attach to the motives of those who, after the death of Fyzoolah Khan, could transfer the flourishing country of the Rohillas from the mild sway of its lawful rulers to the misrule and oppression of the nabob of Oude. A bad was here substituted for a good government, and a happy people delivered over to merciless extortion. Besides, if good government was the object, how greatly would it have been promoted by a remission of the heavy contributions levied by the English? But these were still increased; and it was the amount of these exactions, as well as the mode of raising them, which oppressed the country.

The Mahratta powers.

The Mahratta powers, namely, the peshwa, the nominal head of the confederacy, whose capital was Poonah, the rajah of Berar, Holkar, and Scindia, now remained the only rivals of the English for the dominion of India; and it was the policy of the Marquis Wellesley, as he himself explains at large in his correspondence with the residents in India and the directors at home, to form subsidiary alliances with them, on the same terms as with the other states of India; namely, that a British force should be permanently stationed within their dominions, and that they should assign a sufficient quantity of land for its maintenance and pay. The effect of this alliance, as indeed its object, as stated by the marquis, was to secure the dependence of the different states of India on the British power. "The measure of subsidizing a British force, even under the limitations which the pasha has annexed to that proposal (namely, its being stationed without the limits of his dominions), must immediately place him in some degree in a state of dependence on the British power." This effect was very plainly seen by the Mahratta princes, as well as by the governor-general; and accordingly, though the arrangement was very zealously pressed upon the peshwa, as well as on Scindia, it was steadily rejected by both, until the former was reduced by necessity to accept the alliance of the British on their own terms. This necessity was brought about by contentions amongst the Mahratta chiefs, Holkar and Scindia, for political ascendency in the court of Poonah. Mahadjee Scindia, who was the founder of the family, was the son of Ramojee Scindia, whose humble employment at the court of Poonah was to carry the peshwa's slippers, but who afterwards rose to eminent rank, and was known as an enterprising soldier. Mahadjee was also a soldier, and was present in the fatal battle of Paniput, from which he narrowly escaped with a severe wound in his knee by a battle-axe. He afterwards acquired land and troops, and rose, as the power of the peshwa declined, to the rank of an independent chief. He died at Poonah in 1794, leaving to his grand-nephew, Dowlut Row Scindia, only thirteen years of age, vast possessions and a well-disciplined army.[1] Mulhar Row, the founder of the Holkar family, was born about the year 1693. He was at first a keeper of sheep, afterwards a commander of horse in the service of the peshwa, and at last one of the great military leaders of the Mahratta confederacy. He died in 1766, at the age of seventy-six years, with the character of a plain and generous soldier. Mulhar Row Holkar had only one son, Kundee Row, who was slain, some years before the battle of Paniput, at the siege of Kumbhere. This prince had married the renowned Ahalya Baee, by whom he had one son and one daughter, both of whom died, the daughter on the funeral pile of her deceased husband. Ahalya Baee succeeded to the sovereignty, and assumed as the commander of her army, and her minister for those duties which a female could not perform, Tukajee Holkar, the chief of the tribe, though not related to Mulhar Row. The administration of Ahalya Baee, who is celebrated by Sir John Malcolm as a shining example of great qualities and amiable virtues, was fraught with blessings to her subjects, the country enjoying under her rule more than thirty years of prosperity and peace. Tukajee Holkar, who reigned till the year 1797, left four sons, Cashee Rao, Mulhar Rao, Eithojee Holkar, and Jeswunt Rao Holkar. The succession was disputed by the two elder brothers, who repaired to Poonah for the decision of the peshwa. The influence of Scindia was at this time paramount at Poonah; and having made his terms with Cashee Rao, he surprised and murdered Mulhar Rao, with all his attendants, at Poonah, in September 1797. The wife of Mulhar Rao left a posthumous child, Khundeh Rao, of whose person Scindia got possession, and retaining Cashee Rao in a state of dependence, proposed to govern the dominions of Holkar in his name. The two brothers, Eithojee and Jeswunt Rao, who were at Poonah at the time of the murder, made their escape, the first to Kolapoor, where he was taken, sent to Poonah, and executed; the latter to Nagpoor, where he was arrested and thrown into confinement. Having made his escape, he fled to Mehysser on the Nerbuddah. Here he collected a band of adventurers, and in October 1801 was enabled to fight a battle with Scindia, in which he was defeated with the loss of his baggage and artillery. Before the middle of 1802 Holkar had assembled a new and well-disciplined army. He insisted on the release of the posthumous child Khundeh Rao, the head, as he proclaimed him, of the house of Holkar; and to enforce his demand, he advanced with his troops from Malwah towards Poonah. Scindia collected his army, and on the 25th of October a battle was fought, in which Holkar obtained a decisive victory.

Foreig policy Lord el- lesley.

It was during these transactions that the governor-general deemed the occasion favourable for drawing the Mahratta chiefs into a subsidiary alliance with the British; and it was proposed to Scindia that he should receive a British force into his dominions, that he should cede to the Company a territory sufficient to maintain this force, and that he should admit the arbitration of the British in all disputes with the nizam and with the other states of Hindustan; and the governor-general explains, that if he consent to receive a British force within his dominions, "the arbitration of the British government will necessarily be admitted to an extent proportioned to the ascendency which that government will obtain over Scindia under the proposed engagements, and to the power which it will possess of controlling his designs." Was this system, we may ask, of general alliance and subjection to the British, now proposed by the governor-general, a scheme of benevolence for establishing universal peace throughout India, or one of ambition? War is no doubt the great scourge of humanity; and if it could be superseded by the peaceable arbitration of neutral powers, a great blessing would be conferred on mankind. But it is vain to suppose that the potentates of the earth will voluntarily submit to the curb of reason; and vain was it therefore for the governor-general to endeavour, by persuasion or address, to draw the powers of India into an alliance which would reduce them from the rank of independent princes to mere dependents on the British. That the entire ascendency of the Company's government in India would, in preventing intestine war, have been, as it has since proved, highly beneficial to India, no one could doubt; though, before we can ascribe to the governor-general these benevolent views, we must be convinced that the peace of India was the end, and the ascendency of the British only the means. But, whatever may have been his motives, it is clear that the end, namely, the supremacy of the British, was to be gained, not by peaceable means, but by the sword; that the immediate tendency of his policy was war;—and, in point of fact, it is by war that all India, happily we sincerely believe for the people, has been at length brought under the control of one ruling power, and that universal peace now reigns over that vast continent. It was not yet time, however, for this desirable consummation; and the Mahratta chiefs, as might have been supposed, received with decided aversion the propositions of the governor-general, which amounted to nothing less than a renunciation of independent power. In the defeat of Scindia, however, by Holkar, and the advance of this latter chief to Poonah, the peshwa saw the overthrow of his power; and he quitted his capital, leaving in the hands of the British resident a preliminary engagement, by which he agreed to receive into his territories six battalions of troops, with their proportion of artillery, and to cede a territory for their support either in Gujerat or the Carnatic, yielding twenty-five lacs of rupees.

T ty of B ein, a war w the M ratta c s.

S sses of eneral L and Si rthur W esley.

This treaty, in which it was further agreed that the peshwa should, by the aid of the British, be restored to his dominions and to his sovereign authority, was formally signed at Bassein on the 31st of December 1802; and immediately Sir Arthur Wellesley, on a report that Poonah was in danger of being burned, advanced on that city by a rapid and unexpected march, with a body of cavalry. At the approach of the British, Holkar's disorderly bands fled with precipitation, and soon abandoned the territory of Poonah; and the deposed prince returned in triumph to his capital, amid the acclamations of the people. The treaty of Bassein, and the entire ascendency of the British at the court of Poonah, excited the jealousy of the other powers; and Scindia and the rajah of Berar now entered into a confederacy for repressing this desire of encroachment on the native states. But their motions were narrowly watched by the British; and their armies having taken hostile positions, from which they refused to withdraw, the British were induced to take the field. A vast force was collected. An army under General Lake assembled on the north-western frontier of Oude, which on the 7th of August marched from Cawnpore, and crossing Scindia's frontier on the 28th, took by assault the fort of Allyghur, and on the 9th of September totally defeated, about six miles from Delhi, the Mahratta force, formerly under Perron, a French officer, and still commanded by one of his countrymen, with the loss of all the artillery and baggage. General Lake entered Delhi, evacuated by the enemy on the 14th, and paid his respects to the Great Mogul Shah Aulum, afflicted with age, infirmities, and poverty, in all respects a touching spectacle of fallen dignity. On the 4th he reached Agra, which was taken by assault after a severe contest; and on the 31st defeated, in the well-fought battle of Laswaree, the remaining force of Scindia; and thus in the course of three months overran all his territories in the region of the Jumna. Nor was General Wellesley, who now gave an early promise of that genius for war which was afterwards more fully displayed in the arduous conflicts of Europe, less successful in the south. His first operation was the assault and capture of the strong fortress of Ahmednuggur on the 12th of August; after which, being apprised that the combined armies of Scindia and the rajah of Berar meditated a march on Hydrabad, he concerted with Colonel Stephenson, who commanded a separate corps, a joint attack on the 24th. In the mean time, apprehensive that the enemy meditated a retreat, he attacked with his own division alone the combined Mahratta armies, encamped on the Kaitra river, near the village of Assye, and obtained the victory after a sanguinary conflict, in which, out of 4500 men, the British lost 428 killed and 1138 wounded, and were entirely disabled from pursuing the enemy. Colonel Stephenson, who joined on the 24th, was sent on this duty, and was also instructed to attack Boorhanpore and Asseerghur, of which, and of all Scindia's territories in the Deccan, he took possession. The British arms were now turned against the rajah of Berar; his army was entirely defeated on the plains of Argaun on the 29th of November. Colonel Stephenson, advancing to Ellichpoor on the 5th of December, laid siege to the strong mountain fortress of Gawilghur, near the source of the Taptee, which was carried by assault. The British were equally successful in every other quarter. The country of Bundelcund was speedily reduced; a force from Bombay attacked Scindia's possessions in Gujerat; and a division of the Madras army the maritime province of Cuttack. The Mahratta chiefs now bethought of peace as their only refuge from impending ruin. A treaty was accordingly concluded with the rajah of Berar, by which he ceded to the Company the province of Cuttack, with the port of Balasore, to their ally the nizam, the country lying between his own frontier and the river Wurda to the eastward, and between his own frontier and the hills, in which are situated the forts of Gawilghur and Nernulla to the northward. By the treaty concluded with Scindia, he ceded in full sovereignty the country between the Jumna and the Ganges, to the northward of the territories belonging to the rajahs of Jeepoor, Joudpoor, and Gohud, the fort and territories of Barooch, of Ahmednuggur, and all the possessions which he held on the south side of the Ajuntee Hills to the Godavery river. Provision was made for the independence of all those minor states in the region of the Jumna which had joined the English in the late war. Of these cessions, it was agreed that the territory situated to the westward of the Wurdah, and to the southward of the hills on which were the forts of Gawilghur and Nernulla, together with the territory between the Ajuntee Hills, should be given to the nizam; that the fortress of Ahmednuggur and its territory should belong to the peshwa, and that the English should have the remaining portion. The minor princes near the Jumna, namely, the rajahs of Bhurtpore, Joudpoor, Jeepoor, Machery, and Boondi, the ranah of Gohud, and Ambajee Rao Englah, now became dependents on the British, by whom they were guaranteed in the possession of their dominions, they defraying any charge which might be incurred. Scindia, now weakened by the loss of territory, was really anxious to secure a subsidiary alliance with the English for the security of his remaining dominions against the designs of Holkar. It was agreed that six thousand infantry, with the usual complement of artillery, should be allotted for his defence; that they should be maintained by the English from the revenues of the ceded territories; and that they should be stationed near the frontier, but not within his dominions. It was further agreed, as formerly in the treaty of Bassein, that the British should not in any case interfere between him and his subjects, but that the subsidiary force, if required, should aid in suppressing rebellion and internal disturbances; a condition of doubtful policy, since it evidently implies that the British were to stand still, the quiet spectators of any cruelties the Mahratta chief might inflict upon his subjects; but, the moment they took up arms in their defence, they were to aid in crushing them, as disturbers of the public peace.

Treaty with the Rajah of Berar and with Scindia.

Operations against Holkar.

The short period of tranquillity that succeeded the peace with Scindia was speedily interrupted by Holkar, who, though he kept aloof from the confederacy of his countrymen, with an indifference which seemed to argue at once a deficiency of patriotism and a want of sound policy, was, nevertheless, alarmed by the success of the British arms, and his whole conduct evinced his determination to try the fortune of war. His power and resources had gradually been increased, like that of the other chiefs, by the introduction of European officers into his army, and by an improved system of discipline, which he had established. He was, besides, protected by the nature of his country, which is very mountainous, and, during the rains, impassable from jungles and morasses. His skill in maintaining the predatory warfare, so congenial to a Mahratta army, was far superior to that of the other chiefs, whose ruin had so fully taught him the danger of any regular engagement with European troops. Thus, although his territories were invaded on all sides by detachments of the Company's forces, he constantly eluded their attacks; and, by the singular rapidity of his movements, he was enabled suddenly to assemble almost his whole force, and overpower whatever detachments he might find at a distance from support. In this situation, the troops under Colonel Monson were surprised. This officer, in concert with Colonel Murray, who invaded Holkar's dominions from Gujerat, and captured Indore, the capital, without much opposition, had advanced fifty miles beyond the Mokundra Pass, towards the Chumbul, when, alarmed by the fear of his supplies running short, he resolved to retreat. Being betrayed by his guides, and deserted by part of his troops, he was attacked by a superior force under Holkar himself, before which he was forced to retreat towards Agra, through a country impassable from the rains, and destitute of provisions. After several disastrous conflicts, during a retreat of seven weeks, which degenerated into a flight, the greater part of his guns, and the whole of the baggage and military stores, were lost. A few only of the troops reached Agra at midnight, in a state of extreme distress; the greater part had been overtaken in their flight, and were either massacred, or cruelly mutilated, by their ferocious pursuers.

Colonel Willot of the Bengal artillery was almost equally unsuccessful in an attack which he had planned against a strong post in the interior: he failed in the attempt, and soon after died of the wounds he had received. It was in Bundelcund, and the country of the Rohillas, that Holkar received the most considerable checks, which produced a reverse in his fortunes. From both those territories he was completely driven by Lieutenant-colonel Fawcet and General Smith. On the escape of Colonel Monson to Agra, Holkar advanced with his whole army to Muttra, whither he was followed by General Lake, who arrived at Muttra on the 1st of October 1804, Holkar retiring as he advanced. Here he put in practice a stratagem, which had nearly gained for him great advantages. Leaving his cavalry to engage the attention of the British general, he proceeded with his infantry in secret and by forced marches, and on the 8th he appeared before Delhi, on which he opened a heavy cannonade. Next day he erected breaching batteries, and made a determined assault. But this and a subsequent attack was repelled with such determined gallantry by the small garrison under Colonels Ochterlony and Burn, that he desisted from all further attempts, and departed during the night with his whole force.

Parties of his cavalry had been repeatedly defeated by Lord Lake; but the rapidity of their movements as often saved them from destruction, and it was not till the decisive battle of Deeg, on the 13th of November, that the main strength of this enterprising chief was completely broken. At this place his army, trusting to the great strength of its position, behind successive ranges of batteries, was induced to hazard a general action. From these different batteries, which extended to the depth of two miles, they were successively driven by the gallant General Frazer, who had the credit of forcing a post which had been deemed impregnable, and which at this period was defended by twenty-four battalions of infantry and 150 pieces of cannon. In this brilliant achievement the general received a wound in the leg, of which he afterwards died, and was carried off the field. The completion of the victory thus fell to Colonel Monson, who now saw complete vengeance inflicted for his past disasters, and for the unexampled cruelty of his enemy, 2000 of whom were killed, either in the battle or during the retreat. An immense number was wounded, and amongst these many considerable chiefs; whilst eighty-seven pieces of cannon fell into his hands, which partly consisted of the same guns which he had himself lost during his disastrous retreat to Agra. The important fortress of Deeg was besieged and taken at night, by assault, on the 23d of December.

Had Holkar confided merely to his effective force in the field, his cause might have now been regarded as desperate. His boldness, however, and his unexampled success, had gained him the support of several of the native princes. Among these he had seduced the rajah of Bhurtpore, an ally of the British, and the chief of the celebrated caste of the Jauts, the most warlike tribe in upper India. General Lake was therefore obliged to concentrate his army, and to employ it in the reduction of Bhurtpore, a fortress which experience has proved to have been the strongest and most impregnable in the whole peninsula. Whilst thus employed, the dispersed troops of Holkar had time to rendezvous in distant quarters, and were successful in cutting off his supplies of provisions, and in plundering the surrounding districts, by that predatory mode of warfare for which the Mahrattas have always been celebrated. Scindia, also, who had been engaged in continual disputes with the British respecting the treaty which had been concluded, now openly showed his hostile dispositions by invading the territories of the British allies, by attacking and plundering the camp of the British resident, and by his ill-concealed correspondence with Holkar, whom he now openly joined.

The reduction of Bhurtpore, defended by the indefatigable efforts of Holkar, by its intrepid garrison, and its own natural strength, proved the most arduous enterprise which the British troops had ever undertaken in Asia. The success of the besieged in repelling four different assaults animated them with fresh courage and intrepidity. The rajah and his whole tribe were united by the ties of blood, as well as of civil authority. They laid claim to a high caste among the natives, which they knew must be forfeited for ever by unconditional submission. Unfortunately these were the only terms which General Lake, in the peremptory instructions which were given for its reduction, was permitted to accept. The rajah, therefore, having collected in the fort his women, his children, and his treasures, resolved to bury them all with himself under its ruins, rather than submit to terms which were deemed as disgraceful to his religion and his rank, as they were mortifying to his feelings as a soldier. Compelled by the orders of his superior, and undaunted by all the past disasters which the troops had already suffered, General Lake resolved to hazard another attempt, which was equally unsuccessful with all the others. In the official account given of this last attack, it is said, "the bastion, which was the point of attack, was extremely steep, the resistance opposed to them was vigorous, and as our men could only mount by small parties at a time, the advantages were very great on the side of the enemy. Discharges of grape, logs of wood, and pots filled with combustible materials, immediately knocked down those who were ascending; and the whole party, after having engaged in an obstinate contest for two hours, and suffering very severe loss, was obliged to relinquish the attempt, and to retire to our trenches." The loss of the British army in this last assault, and that of the 20th, amounted to 300 killed, and 1564 wounded; its whole loss, during the different attacks, amounted to upwards of 3000 of the bravest of our troops, whilst the unconditional surrender of the place, though the ultimate object of all these perilous attempts, was never attained. The rajah, however, again proposed the terms he had formerly offered, and consented to pay three lacs of rupees to the army, and the expenses of the war. Hostages were given for the regular discharge of these sums, at different instalments. Thus the last prince in India who resisted the British arms was found to have made the most glorious defence of his independence, and to have secured for himself the most honourable terms. Holkar, unable any longer to face the British troops, was reduced to the condition of a fugitive; and flying from place to place, often beaten, and at last deserted by almost the whole of his troops, was obliged to escape with a retinue so scanty as was hardly sufficient for the protection of his person.

rival of rd Cornllis. Pa-ic policy.

The directors of the Company in Europe, though they were dazzled for a time by the splendid successes of the British arms, were at length startled by the warlike policy and prodigal expenditure of the Wellesley administration; and, with a view to retrieve their embarrassed affairs, the Marquis Cornwallis was sent out as governor-general to Calcutta, where he arrived on the 30th of July 1805. He entirely disapproved of the system of subsidiary alliances adopted by his predecessor, by which the British were entangled in the labyrinth of Indian politics. He censured in strong terms the treaty of Bassein, which reduced the British, as he states, to "the alternative of mixing in all the disorders and contentions incident to the loose and inefficient constitution of the peshwa's administration, or of suffering the government and dominion of his highness to be completely overthrown by the unrestrained effects of general anarchy and rebellion. Under such circumstances," he adds, "the alliance with the peshwa, far from being productive of any advantage to the Company, must involve us in inextricable difficulty, and become an intolerable burden to us." In pursuance of these views, he resolved, as soon as Scindia should release the British residency, to conclude a treaty with him, and to restore to him Gualior and Gohud, the points in dispute. At this critical period Lord Cornwallis, languishing under age and infirmities, expired. But his successor, Sir George Barlow, entered entirely into his views. A treaty was concluded with Scindia on the terms proposed; the British agreed to renounce all interference, by treaties or otherwise, with the rajahs of Odeypoor, Joudpoor, Kotah, and other chiefs, the tributaries of Scindia, in Malwah and Mewar. A treaty was concluded with Holkar, on the 24th of December 1805, by which all his former territories were restored to him, both on the north and on the south of the Chumbul. According to his system, Lord Cornwallis dissolved all the alliances which had been formed with the petty princes of India, several of whom had aided the British in the late contest. Lord Lake earnestly remonstrated in vain against this abandonment of the British allies, several of whom were now left, contrary to the faith of protecting treaties, to the vengeance of the Mahratta chiefs, Holkar and Scindia.

eneral ace.

paulese r.

From the year 1805, when a general peace was established by Lord Cornwallis, to the year 1813, when Marquis Hastings assumed the government, the political relations of the Company with the native powers had undergone little alteration. The tranquillity which prevailed was, however, more apparent than real; and it was naturally to be supposed, indeed, that the widely extending domination of a foreign power would excite the jealousy of the native princes of India. Such of them, accordingly, as retained any sense of national honour were naturally hostile to the British, and were well disposed to unite against them as the common enemies of Indian independence. In 1814 the war with the Nepaulese commenced, and in the outset the reverses sustained by the British in their attempts to penetrate into the hill country strongly excited the hopes of the native princes. In the following year, the valour and military talents of Sir D. Ochterlony brought that war to a brilliant close; and the bravery and discipline displayed by the troops in the course of the campaign renewed among the Indian princes the former impression of their invincible superiority. Whatever might be their ulterior views, therefore, they were compelled for the present to temporize, and to soothe their conquerors by an outward show of humility and peace.

Incursions of the Pindarees.

A more favourable opportunity, as they conceived, soon occurred for successful resistance to the British power. From the constant wars and commotions in which India had from time immemorial been involved, it happened that a great proportion of the native population were trained to habits of disorder and military license. At the general settlement concluded in 1805, it was naturally supposed that those bands of adventurers, having no longer any scope for their predatory enterprises, would betake themselves to pacific pursuits, and would thus be gradually dissolved among the mass of the people. It happened otherwise. Those hordes of freebooters, known under the general denomination of Pindarees, improved both in strength and union, and Scindia and Holkar, in whose neighbourhood they were settled, if they did not openly abet them, made no active efforts for their suppression. The nature of their force may be shortly described. It consists of a species of light cavalry, which was formerly attached to the native armies, in the same manner and for the same purpose as the Cossacks are to the armies of Russia. Their horses were trained to long marches and hard fare, it being their object to plunder the country, and to elude pursuit by the celerity of their movements. They were generally armed with a bamboo spear, from twelve to eighteen feet long; every fifteenth man carried a matchlock; about four hundred out of every thousand were well mounted; of the remaining six hundred, four hundred were indifferently mounted, and the rest were slaves, attendants, and camp-followers, mounted on wild ponies, and keeping up with the corps as they best could. About the year 1814, these predatory bands comprised about 40,000 horse, who followed plunder as their mode of subsistence, and were indeed a most formidable species of gang-robbers; but, like other robbers and murderers on a great scale, they assumed all the form and pomp of military array. The strength and numbers of this disorderly mass were daily increasing by deserters from Holkar's irregular bands, and from the loose cavalry establishments of Scindia and others, where they were retained by no tie but that of present advantage, and where their pay was always in arrear. The central situation of the Pindarees, at an equal distance from the three presidencies, rendered their hostility still more formidable, and enforced on the British the necessity of maintaining an extensive line of defence, which was always penetrated by those flying hordes, and the territories of our allies exposed, in consequence, to annual devastations. In 1808–1809, and in 1812, they carried their incursions into the British territories, and returned loaded with spoil. The fame of these successful exploits recruited their bands, and enabled them to extend their ravages. In October 1815, a force of 8000 Pindarees crossed the Nerbuddah in a north-west direction, and dividing into two parties, they penetrated to the Kistnah, though they were watched, and one party was surprised by a body of infantry and cavalry, which did them, however, little damage. They were only deterred from crossing into the Madras presidency by the swollen state of the river, along the fertile and populous banks of which they took their course, plundering as they went along, and committing every kind of enormity. In their return along the line of the Godavery and the Wurda, they passed the British positions, making good their retreat with an immense booty, and with utter impunity. A second expedition was soon planned, which, crossing the Nerbuddah, appeared on the western frontier of the district of Masulipatam, under the Madras presidency, on the 10th of March 1816. Next day they made a march of thirty-eight miles southward, plundering ninety-two villages, with every circumstance of unheard-of cruelty; and on the 12th they marched thirty-eight miles, plundering fifty-four villages. By the 17th May they had nearly all recrossed the Nerbuddah, loaded with spoil, and with scarcely any loss. During the twelve days that they had remained within the Company's territories, it was ascertained that 182 persons had been put to a cruel death, 505 were found severely wounded, and 3603 had been put to different kinds of torture.[1]

War with the Pindarees.

It now became necessary to adopt efficient means for protecting the country against these destructive visitations. For this purpose a defensive line of posts was extended along the Nerbuddah, and across the country for about 150 miles. This was, as usual, soon penetrated by the activity of the enemy, and various expeditions advanced southward for the purpose of plunder. By the singular activity of the different corps, and by a train also of fortunate accidents, almost all of these expeditions were intercepted, broken, and discomfited, so that very few of the plunderers made good their retreat. It was resolved, however, in the year 1817, to commence offensive operations; to attack the enemy in their native haunts, and either to exterminate them, or to drive them from the advantageous position which they occupied, in the very centre of India. The season of inaction was accordingly spent in making preparations for a great military effort; and, by the end of the rainy season of 1817, a numerous and well-appointed army was ready for the field. The plan of the campaign was, that the armies of the different presidencies should advance northward, and gradually converging to a common centre, hem in, on every side, the devoted territory of the freebooters.

War with the Peshwa.

But whilst this plan was in progress, it was interrupted, and part of the troops engaged in executing it were suddenly recalled, by the unexpected hostility of the native powers. Bajee Rao, the peshwa or prince of Poonah, who had long been impatient of the British yoke, availed himself of this opportunity to make a fresh attempt to recover his independence. With a view of more vigorously prosecuting the war against the Pindarees, all the troops had moved northward, with the exception of a brigade which had been left at Poonah; and it was to overpower this small body of troops that the peshwa's first efforts were directed. They were completely unsuccessful; he was repulsed at all points by the steadiness of the Company's troops. This action took place on the 5th of November. On the 13th, the British were joined by General Smith's division, which had advanced on the Godavery, on an understanding, that if he did not hear daily from the resident at Poonah, he should countermarch to that place. It was resolved to attack the enemy's camp next day; but it was found deserted. General Smith immediately commenced an unremitting pursuit of the peshwa, who was hunted from place to place by the different corps of the British army, until he at length deemed it prudent to surrender. He was deposed from his throne; a residence in a particular city was fixed upon for him; and a pension of about L.100,000 per annum assigned him for his support. His dominions were of course taken under the administration of the British.

War wit the Raja of Nagpoor.

The rajah of Nagpoor, Appa Saheb, who was held in the same thraldom by the British, pursued a similar course, and with the same results. On the 26th of November, at sunset, he attacked, with a great superiority of force, the brigade left at the residency, which was in consequence in great peril. A doubtful contest was maintained through the night, and next day the attack on the British was renewed with fresh vigour. Under every disadvantage those attacks were finally repulsed, and the weak prince, Appa Saheb, taking fright, sent to ask forgiveness from his enemies. The conditions offered him were, that his territories should be placed at the mercy of the British government; that he should give up all his artillery, disband his troops, and come in person as a hostage into the British camp; on an understanding that if he acceded to these terms, the former relations between him and the British would be restored; it being at the same time understood that he should cede part of his territory, and that due provision should be made for a greater degree of internal control over his future movements. Being threatened with an immediate attack, he came to the British camp with a few attendants. His troops, as if to shame their pusillanimous prince, fought an unsuccessful battle for his rights and independence; after which the city of Nagpoor, with its fort, was surrendered to the conquerors, and this second war was brought to a triumphant close. Appa Saheb, afterwards repenting of his spiritless conduct, began to plot new schemes, when he was arrested by the British resident, and detained in close confinement. He found means to escape in the summer of the following year, and making good his retreat to the hills, where he was joined by a band of irregular followers, he distracted the country for a time by desultory hostilities. Having thus fled from his dominions, the conquerors determined to invest Bajee Rao, a grandson of Raghojee Bhoonsla, with the sovereignty, and to take the internal administration wholly under their own control. It had been the professed intention of the Anglo-Indian government, according to its usual arbitrary mode of treating the native powers, to force the two independent chiefs, Scindia and Holkar, into an acquiescence with its views in regard to the Pindarees, and also the Patans, a species of infantry, better appointed, and more regularly disciplined, than the Pindarees, but associated together on the same unlawful principle of indiscriminate plunder. Scindia had been compelled to temporize, and finally to accede to the British propositions. The court and administration of Holkar were distracted by contending factions. The late prince, after the unfortunate issue of his war with the British, became deranged, and soon afterwards died. His heir, Mulhar Rao, was at the time under age; and Toolsye Bhye, the widow of Holkar, and now appointed regent, contended for supremacy with the Patan chiefs. Their views were entirely discordant, the queen-regent soliciting an alliance with the English, on condition of receiving a subsidiary force; a measure so strongly opposed by the military chiefs and the troops, that they conspired against Toolsye Bhye, and having seized her person, carried her to the banks of the river, where she was put to death. After this outrage, they prepared for war, and troops were concentrated in such hostile positions, that Sir John Malcolm judged it expedient to fall back. Having effected a junction with the corps under Sir J. Hislop, they attacked, on the 21st of December 1817, the army of Holkar, encamped at

---

[1] *Narrative of the Political and Military Transactions of British India under the Administration of the Marquis of Hastings.* By Henry T. Prinsep, chap. i. and v.

Mehedpoor, and advancing to close action under a severe fire of artillery, the enemy's troops gave way at all points, and the camp, artillery, and baggage, fell into the hands of the victors. Peace was sought and obtained by the Patan chiefs, who ruled in the councils of Holkar; they accepted the protection and alliance of the British; and thus they enrolled themselves amongst the dependents and tributaries of the new sovereigns of India.

The main object of the war, which was the destruction of the Pindarees, was not, in any material degree, impeded by these incidental contests. According to the plan proposed, the different divisions of the grand army proceeded northward, converging as they advanced for the purpose of surrounding the haunts of these freebooters, and preventing their escape. They were driven out of the province of Malwah, retiring as the British advanced; but were at length so effectually hemmed in, that in attempting to retreat they were intercepted at all points, and the greater part of them destroyed. The remainder were so humbled by fatigue and misery, that they were glad to submit upon any terms; and at length the three principal leaders surrendered on condition that their lives should be spared.

tlement the ıntry.

All open resistance being thus successfully put down, the more important task still remained of quieting and conciliating the country, overrun by lawless hordes of troops or banditti. The history of Hindustan is, from its earliest period, one unvarying scene of intestine violence, of war, rapine, rebellion, and bloodshed. For twenty years prior to the Pindaree war, these disorders had been increasing; and to still this intestine storm, to overawe the turbulent, and to settle on a permanent and equitable basis the conflicting claims to dignity, power, and property, which had arisen in a long period of trouble, when might was the test of right, was a task that required unusual prudence, firmness, and patience. This difficult and all-important duty now devolved on Sir John Malcolm, who to his glory as a warrior now added the still greater glory of a legislator and a statesman. Whilst he distributed his troops in such positions throughout the disturbed districts, as entirely to overawe the fiercer mercenaries and turbulent Arab soldiers, he conciliated the peaceable inhabitants by mildness, moderation, and justice. To all ranks, to the head of a village as well as to the sovereign of a kingdom, to the leader of a gang of robbers as well as to the commander of an army, he explained that his sole object was to establish the peace of the country. By kindness and conciliation he succeeded in reclaiming the Grassia, Rajpoot, and Bheel freebooters, and the discharged Patan mercenaries, accustomed to prey on the country. Persecuted and oppressed as outcasts and robbers, they were won by the generous confidence of Sir John Malcolm, who offered them pay in the British service, and employed the most notorious of the Bheels to guard his person and treasure, in which they proved invariably faithful. Thus the disorderly bands amongst the Pindarees and Patan soldiery, for many years the disturbers of India, were gradually converted into its industrious cultivators; and a great and happy change was effected in the habits of the people and in the aspect of the country. The several princes and rajahs of Central India were enriched by increased revenues and diminished expense. The troops maintained by Scindia were reduced from 39,000 to 22,000; and those maintained by the rebellious chiefs and tributaries, always ruinous to the country, were disbanded. His revenues were increased twenty-five per cent., and the expenses of collection reduced fifteen per cent. The revenues of Holkar were increased from four lacs in 1817, to sixteen lacs in 1819–1820. The condition of all the other inferior rulers and feudatories was improved in the same degree. "In 1817," says Sir John Malcolm, in his admirable work on Central India, "there was not one district belonging to Scindia that was not more or less disturbed; in 1821 there existed not one enemy to the public peace." Colonel Todd, the political agent of the British in the Rajpoot states, and who was present at the great pacification of 1818, describes, with his usual force, the desolate state of the country. From Jehaijpoor westward to Komulmer, a space of 140 miles, he mentions that "all was desolate; even the traces of the footsteps of men were effaced. The babool (*mimosa Arabica*) and gigantic reed, which harboured the boar and the tiger, grew upon the highways; and every rising ground displayed a mass of ruin. Bhilwara, the commercial entrepôt of Rajpootana, which ten years before contained 6000 families, showed not a vestige of existence. All was silent in her streets; no living thing was seen, except a solitary dog, that fled in dismay from his lurking place in the temple, scared at the unaccustomed sight of man." Odeypoor, the capital of Mewar, which formerly contained 50,000 houses, had not above 3000 occupied; the rest were in ruins, the rafters being taken for firewood. Money was scarce, and the prince was obliged to borrow at the rate of thirty-six per cent. In the tracks near the Vindhya range and the Nerbuddah, where the Pindarees, Gonds, and Bheels had their homes, hundreds of villages were to be seen deserted and roofless. Of 3701 government villages which belonged to Holkar, only 2038 were inhabited in 1817. In 1818, 269 villages were restored; in 1819, 343; and in 1820, 508. These villages exhibit a lively portrait of an Indian community; and it is remarkable, that on the proclamation by the British of protection and peace throughout India, these communities instantly revived in their original structure, with all their native functionaries, who re-assembled at once from the different countries into which they had been scattered by the wars and revolutions of the last twenty years. Well may Colonel Todd exult with a generous enthusiasm on the revival of this oppressed country from desolation and misery. The commercial mart of Bhilwara rapidly rose from ruin, and in a few months contained 1200 houses. "Bales of goods, the produce of the most distant lands, were piled up in the streets lately overgrown with grass; and a weekly fair was established for home manufactures. The most enthusiastic proofs were afforded, that neither oppression from without, nor tyranny from within, could expel the feeling for the *bassota*, the land of their fathers. Even now, though time has chastened the impressions, we should fear to pen but a tythe of the proofs of the devotion of the husbandmen of Mewar to the *solum natale*. It would be deemed romance by those who never contemplated humanity in its reflux from misery and despair, to the 'sweet influences' of hope; he alone who had witnessed the day of trouble, and beheld the progress of desolation, the standing corn grazed by Mahratta horse, the rifled towns devoted to flames, the cattle driven to the camp, and the chief men seized as hostages for money never to be realized, could appreciate their deliverance. To be permitted to see these evils banished; to behold the survivors of oppression congregated from the most distant provinces, many of them strangers to each other, and the aged and the helpless waiting the lucky day to take possession of their ruined abodes, was a sight which memory will not part with." After mentioning that on a lucky day three hundred husbandmen, preceded by music and banners, marched into Kupasun, to take possession of their properties, and that above three hundred towns and villages were simultaneously re-inhabited, he adds, in a strain of just exultation, "Well might the superstitious fancy that miracles are abroad; for even to those who beheld the work in progression, it had a magical result; to see the

Reviving prosperity.

waste covered with habitations, and the verdant corn growing on the fields, where lately they had roused the boar from his retreat. It was a day of pride for Britain. By such exertions of her power in these distant lands, her sway is hallowed; by Britain alone can this fair picture be defaced; the tranquillity and independence she has conferred, by her alone may be disturbed."[1]

Petty states of India.

After the contest was brought to a close, the country was still overspread with disorderly bands of Arabs, Mekranies (from Meckran in Persia), Mewassies, and Patans; and the general result of the arrangements now adopted was the expulsion of these disturbers of the country, and the restoration of the just rights and dignities of Scindia and Holkar, as well as of a crowd of petty feudatories and renters, who were before the prey of freebooters. The same system was extended to the Rajpoot states to the north-west of Malwah and the Chumbul river. The petty rajahs who occupied this country were continually at war; and the country was besides laid waste by the predatory bands of Ameer Khan, Holkar, and Scindia, who, on pretence of espousing the quarrels, invaded and plundered the territories of the different chiefs. These evils had risen to such a height, that they were all desirous of being admitted into a federal union with the British government, offering in some cases half their dominions for protection. In 1818 they were admitted into this union, of which the British are at the head. They agreed, in the event of any future differences amongst them, instead of appealing to arms, to submit their differences to the arbitration of the British government. In this manner their country, freed from the scourge of internal war, has progressively improved. The military adventurers who fled before the victorious armies of Britain, were reduced to submission by the wise and conciliatory measures of Sir D. Ochterlony, combined with skilful military movements. The Patan battalions, with about 3000 horse, were taken into the British service, the officers being dismissed with pensions. These measures have been followed by the happiest effects. The wretched peasantry have emerged from their hills and fastnesses, the usual refuges of the oppressed, and have occupied their deserted villages; the ploughshare is again at work on a soil undisturbed for years, except by the hoofs of predatory horse; and although the fierce habits of war may occasionally recur, yet the foundation of improvement is laid. The daring robber, moulded by time and the force of circumstances, will gradually exchange his wild and disorderly habits for those of the peaceful cultivator, and commerce and industry succeed to scenes of desolation and war.

Policy of the British.

A wise and beneficent policy on the part of the British would realize all those happy prospects. But Colonel Todd seems to doubt whether this line of policy will be adopted. He censures in strong terms the treaties which have already been concluded with the Rajpoot princes, by which they are laid under a heavy annual contribution, and their territories, to use Colonel Munro's expression, converted into rack-rent estates for the British. The rana of Odeypoor is bound to pay one half of his revenues for five years, and three eighths in perpetuity; which condition not only imposes a heavy burden on the cultivator, but lays the foundation for British interference in all the concerns of the tributary state, and for endless disputes in consequence, and finally, for the subjugation of the country. After observing that the dread of being incorporated with our empire prevails amongst this proud people, Colonel Todd observes, "With our present system of alliances, so pregnant with evil from their origin, this fatal consequence, far from desired by the legislative authorities at home, must inevitably ensue. If the wit of man had been taxed to devise a series of treaties with a view to an ultimate rupture, these would be entitled to applause as specimens of diplomacy. There is a perpetual variation between the spirit and the letter of every treaty; and while the internal independence of each state is the ground-work, it is frittered away and nullified by successive stipulations; and these positive and negative qualities continue mutually repelling each other, until it is apparent that independence cannot exist under such conditions. Where discipline is lax, as with these feudal associations, and where each subordinate vassal is master of his own retainers, the article of military contingents alone would prove a source of contention. By leading to interference with each individual chieftain, it would render such aid worse than useless. But this is a minor consideration to the tributary and pecuniary stipulation, which, unsettled and undetermined, leaves a door open to a system of espionage into the system of their revenue accounts; a system not only disgusting, but contrary to treaty, which leaves internal administration sacred. These openings to dispute, and the general laxity of their government, coming in contact with our regular system, present dangerous handles for ambition; and who so blind as not to know that ambition to be distinguished must influence every vice-regent in the East; while deeds in arms, and acquisitions of territory, outweigh the meek eclat of civil virtue, the periodical visitations to their kingdoms will ever be like the comet's, 'Foreboding changes to princes.'" The rapid progress of the British dominion in the East too fatally confirms the truth and wisdom of these admirable remarks.[2]

Runjee Singh.

The country of Lahore, or the Punjab, as far as the Indus, is occupied by the rajah Runjeet Singh, who, in the year 1805, when Lord Lake had an interview with him, seemed to be one amongst many petty chiefs. But between this and 1812 he had subdued the whole country, and was proceeding to extend his power over all the petty chiefs as far as the Jumna, when he was opposed in 1808 by a strong military detachment of British troops stationed at Ludiana. A treaty was concluded in 1809, by which it was mutually agreed that the rajah should not encroach on the territory to the north of the Sutledge, nor the British on the territory to the south of that river.

Siege o Bhurtp

The peace of India has since been interrupted by the Burmese war, and by the siege of Bhurtpore. The rajah, confiding in the strength of his fortress, committed several enormities in his government, such as the seizure of the infant rajah, and the murder of his uncle and followers; and he even treated the remonstrances of Lord Amherst with indifference or contempt. In these circumstances, the reduction of this formidable stronghold was essential to the glory of the British arms, on which former failures had left a stain. The siege was accordingly commenced with 25,000 efficient troops; and as no impression could be made by cannon on walls of clay sixty feet in thickness, they were thrown down by the explosion of a mine. The assault took place next day, the 17th January 1826, which was completely successful, with the loss of 163 killed, and 466 wounded. The principal works of the fortress have since been demolished.

Burme war.

The British rulers of India and the Burmese monarch had long been involved in mutual disputes, and these were brought to an issue in 1822, by a claim set up by the sovereign of the Burmese to the petty isle of Shapuree, in the province of Bengal, on the Chittagong frontier, and by aggressions on the British territory, which were repelled by a force stationed at Chittagong, whilst a large armament was sent to Rangoon, the naval arsenal of the Burmese empire, which was captured; and, after a series of hard-fought actions by the British, who endured much privation and distress, the monarch of Ava was compelled, in 1826, to sue for peace, by the near approach of the army to his capital.[1]

Pol al sys n of Ind

The wars and commotions of India have thus at length come to a close, and Great Britain remains the sole ruler of that vast empire. The native princes, rajahs, and petty feudatories of the country, hold their several dignities and stations in the great political system of which they form a part, under the guarantee of her sovereign authority. The nature of the subsidiary alliances of the British with the Indian states has been already described, namely, the furnishing a force, which is stationed in the dependent state for its protection, and the latter a territory equivalent to its maintenance, and further submitting, in its foreign relations and differences with other states, to the arbitration of the British government, though free from all control in its internal concerns. The powers with whom subsidiary alliances have been formed are the nizam or subahdar of the Deccan; the nabob of Oude; the Guicowar, whose dominions are in the province of Gujerat; Holkar, who has been deprived of all his dominions south of the Nerbuddah; the rajah of Nagpoor, reduced, since 1817, to insignificance; the rajahs of Cutch, of Mysore, of Travancore, and of Cochin. The protected states are so far reduced to dependence that they agree to maintain no correspondence with foreign powers of a political tendency without the privilege or consent of the British government, and not to go to war, but to submit all their differences with other states to the arbitration of the British. They are independent in their internal concerns, and have not, like the others, a British force stationed within their territories. They are bound to furnish a contingent of troops when required, which in the field act in subordination to the British commanders. These states are, 1*st*, in the north-west, Siccim and the Sikh and Hill states, on the left bank of the Sutledge: 2*d*, Rajpoot states; Bicanere, Jesselmere, Jeepoor, Joudpoor, Odeypoor, Kotah, Boondi, Serowey, Kishengurh, Dowleah and Pertaubgurh, Doorapoore, Banswarra: 3*d*, Jaut and other states on the right bank of the Jumna; Bhurtpore, Ulwar or Macherry, Kerowlee: 4*th*, Boondelah states; Sumpthur, Jhansi, Jaloun, Oorcha or Tehree, Dutteah, Rewah: 5*th*, States in Malwah; Bopaul, Dhar, Dewas, Rutlaum, Silana, Nursinghur, Amjherra, &c.: 6*th*, States in Gujerat; Pahlunpore, Rahdunpore, Rajpeepla, Loonawara, Soonth, the states in the Myhee Caunta, the Kattywar states: 7*th*, States on the Malabar coast (chiefly Mahratta); Sattarah, Sawunt Warree, Colapore, Collabba: 8*th*, Burmese frontier; Cachar, Jyntia. States not under British protection; Scindia, the rajah of Dholapore, Barree and Rajakera (formerly rana of Gohud), Runjeet Singh of Lahore, the ameers of Scind, and the rajah of Nepaul. Scindia, though not formally a protected or dependent state, is substantially under the control of the British, who now settle with many of his tributaries, collecting his revenue, and paying it over to him; so that they have secured their ascendency in all the western and southern districts of his dominions, which, in the event of a war, they might employ against him for his destruction. Of this, according to Sir John Malcolm, he is so sensible, that he has abandoned all idea of ever again opposing the British government.

Ca s of the i- tish c- cess

The rise of the British power, from small beginnings into so vast an empire, is one of those surprising revolutions in human affairs which gives to history the air of a romance. The managers of a trading company in London are now the lords of a kingdom ten times the size of England, and containing a hundred millions of inhabitants; they engage in war and make peace; they rule over kings and princes, dethroning some and setting up others in their stead; and in their counting-house in Leadenhall Street they regulate, not the chances of profit and loss, but the concerns of a vast empire. Yet the causes of this great revolution are simple and obvious. The extensive dominion acquired by the British in India is the consequence of long-continued military success; it is the fruit of victory in many a well-fought field, the triumph of European discipline and science over the rude valour of the hasty levies and imperfectly trained militia of the East. In the course of this long contest the British had frequently to contend with few against many, and their empire sometimes tottered on the verge of ruin, as in the invasion of the Carnatic by Hyder Ali. But the steadiness of the European infantry still repelled the irregular charges of the Mahratta horse, and triumphed in the end; and to this powerful instrument, namely, a well-disciplined military force, wielded by skilful hands, the British are indebted for the conquest of Hindustan. The extension of their empire in India was always discountenanced by the Directors at home, who issued their repeated and peremptory commands on the subject. Yet it might have been easily foreseen, that, the foundation once laid, the superstructure would naturally arise; that having made the first step, the British would not readily stop short in their course. The frailty of man has never been able to resist the allurements of ambition; the dazzling prize of extensive dominion has in all ages been pursued through the paths of blood; and it was scarcely to be imagined that the Company's servants in India would resist its temptations, more especially as there were many circumstances which gave a plausible colour to their ambitious views. The native powers, alarmed by the territorial acquisitions of the British, naturally combined against them as the common enemies of Indian independence. The British, on the other hand, convinced of their strength, and of the hatred and jealousy which they had excited throughout India, and easily yielding to the least surmise of hostile coalitions, often took up arms to avert distant and doubtful dangers; and victory being still the result of each new struggle, they assured their safety by the ruin of their enemies, and by the extension of their power. Thus the hostile designs of Tippoo rested upon mere suspicion, and he was overthrown when he was no longer formidable, and when he was thought to be an easy prey; and thus have all the independent states of Hindustan been successively crushed by their great rival, and war only ceased when no enemy remained to be conquered. Peace now reigns throughout the wide precincts of Hindustan,—of itself an unspeakable blessing, especially in India, so long the scene of ruthless war, massacres, and devastation; and this is no doubt the consequence of British ascendency. Happy, if, along with this blessing, we diffuse among the ignorant, superstitious natives, the arts, the knowledge, the improvements, and the enlightened morality, of Europe.

Internal policy of the British.

It will now be proper to give a brief account of the domestic policy of the Company as sovereigns of India, especially in those important departments in the civil administration of every country, namely, the revenue, the judicial establishments, and the police.

Land-tax under the Mogul empire.

Under the Mogul government, the public revenue was chiefly derived from a general land-tax, and the regular payment of this tax was the tenure by which property was held throughout the empire. The lands were possessed by different descriptions of owners or occupiers, under the titles chiefly of zemindars or polygars, the military chieftains of the Carnatic, talookdars, ryots, maliks, meerassadars, nair mulguenies, bhoomias, &c.[1] When Hindustan was brought under the sway of the British, they were necessarily ignorant of the manners and usages of the people, and of the peculiar structure of a Hindu community; and hence the nature of the tenures under which land was held, and of the different descriptions of land owners and occupiers, has been a standing subject of controversy amongst the Company's servants, some insisting that under the Mogul despotism, as over all the East, the sovereign is the sole proprietor of the lands within his dominions; that no private right of property has ever been recognised in any of the great monarchies of Asia; and that all grants of land are resumable at the pleasure of the prince. According to this theory, the zemindar is considered merely as a species of steward or factor, appointed by the government, to collect and superintend the land revenues; and after reserving a suitable portion for his own maintenance, to remit the surplus to the imperial treasury. The rights of the talookdars, an inferior description of holders, and the ryots, and other occupiers of land, were still more imperfectly understood by the English when they acquired the dominion of Bengal; but, under the idea of the sovereign's indefeasible right in the soil, they naturally considered them as tenants at will, to be dealt with like other tenants in the same situation, at the pleasure of the proprietor. This hypothesis of the sovereign's proprietary right was eagerly adopted by the English, and has been boldly followed up in practice. It has, as might have been expected, led to extensive confiscations of land, to great changes in the state of property, and to much distress and confusion, as will be afterwards narrated; and it will be proper, therefore, briefly to inquire how far this claim accords with any legal right, and still more with any principle of enlightened policy.

---

[1] For a full account of the operations of this war, see the article AVA.

Sovereign's proprietary right considered.

In a government purely arbitrary, where every man holds life and liberty at the mercy of the sovereign, it is extremely difficult to distinguish between the exercise of legal rights and the outrages of abused power. That the despotic rulers of the East might take possession of the land, or of any other description of property belonging to their subjects, and that this was their practice, can hardly be questioned. But might does not constitute right; nor by such acts of tyranny can they become lords of the soil in any legal sense, any more than of the lives and liberties of their subjects, because they often massacre and torture them at their pleasure. The law of conquest, which is the law of the strongest, gave to the Mahommedans possession of India, which they desolated with fire and sword, and took possession of the lands and properties of the inhabitants, who, according to their approved practice, might have been all put to the sword, as the redemption price of their blood. This was the only title which the Mogul emperor could have had to the lands within his dominions, namely, that he had seized upon them by force; and in countries long subject to Mahommedan rule, or to the Mahrattas and other domestic tyrants, all the ancient rights of the proprietors have accordingly been obliterated. But these acts of tyranny and spoliation can never be construed into legal precedents, nor can they ever confer any title; and it seems a gross abuse of words to call that a right which is merely a deed of violence.

The monarch or the emperor was no doubt styled, in the true strain of oriental flattery, the sole proprietor of the soil, and the lord of the universe; and this he may have been originally, in the same manner as the monarchs of Europe were under the feudal system. According to the feudal law, they were the supreme lords of all the conquered territories, which they granted as fiefs to their vassals, on condition of military service; and from the monarch a subordinate chain of vassalage extended downward to the lowest tenant. These lands were at first granted for a year, but afterwards for life; at length they became hereditary, and descended to the son, or to more distant relations; and thus they finally became a permanent property. But the form of the original tenure is still maintained. They still hold of the sovereign, to whom, at the death of each heir, a formal surrender is made of the property, and a new charter is granted as a matter of course. But this right of the crown, by which in former times the property was actually resumed at the death of the proprietor, has now become a mere legal fiction, an evidence only of the original tenure by which the property was held; and we may easily imagine the disorder and injustice that would be introduced into any European country by a conqueror, who, guided by feudal forms, in opposition to immemorial usage and fixed law, was to resume all property holding of the crown, or of any other superior. In like manner, in Hindustan, though the sovereign was styled the proprietor of all the lands within his dominions, and in legal theory might be so, it would be rash to infer from this the actual extinction of all proprietary rights. Under the Mogul government a heavy tax was, no doubt, laid on the land, which was the main source of the public revenue. But individual rights of property might nevertheless exist; and their non-existence has certainly never been satisfactorily proved; so far from it, that the advocates of the sovereign proprietary right seem to have nothing to oppose to immemorial usage, and to the principles of justice, but legal forms and the acts of despotic power.[2]

But the abstract question of right here merges into the higher question of policy. It would be the interest of a sovereign, even if he were proprietor of the soil, to commute his rights for a moderate and fixed assessment, which in the end would bring in the greatest amount of revenue. A land-tax which leaves a bare maintenance to the cultivator discourages agriculture, population, and the growth of capital; it is indeed an interdict on all improvement. Its produce cannot be increased except by the most ruinous extortions, though it will necessarily decrease with the desolation of the land, which it tends to promote. No country can be improved and cultivated where the rights of property are loaded by a public tax. Would the wastes of America, we may ask, be so quickly converted into fruitful fields, if the government were to come in for the largest share of the produce, if the owner were placed under the strict surveillance of the excise, and obliged to account for every particle of his crop. In Europe the church tithes have been justly complained of as a great obstruction to improvement. But a tax such as we have described, which, however it varied in its amount from a fourth, a third, or half the gross produce of the soil, generally left only a bare maintenance to the cultivators, is far more pernicious in its operation; and it is indeed owing to its pressure that so large a portion of Hindustan still remains a primitive wilderness. Mr L. Place, to whom was committed, in 1790, the settlement of the Jaghire, a tract of country in the Carnatic that had been ruined by the invasion of Hyder Ali, after mentioning the desolation of the country, and that the inhabitants would not cultivate any fields except under a secure tenure, adds, that "by granting them lands to them and their heirs for ever, so long as they continued in obedience to the circar (government), and paid all just dues, he was enabled to convert the most stubborn soil and thickest jungle into fertile villages."

---

[1] See Colonel Todd *On the Feudal System in Rajast'han*, vol. i. chap. i. p. 167. See also *Fifth Report*, p. 822–23, Extracts from Mr Thackeray's Report, dated 4th August 1807.

[2] The masterly reports of the Company's collectors in Southern India all concur in stating the hereditary rights of individuals in the land to be clear and unquestioned from the most remote ages. " In tracing their (the Hindus') past situation," says one of the collectors, " it is not to be discovered, that during the revolutions of many ages, from the reign of their first princes, until the final downfall of the Hindu authority, any questions ever existed, in any stage of the Hindu history, as to the right of the people to the lands of the country, excepting villages or lands totally waste, and that had escheated to government. On the contrary, they appear to have been transmitted to them, from the most remote era, down to the present time, without interruption; these rights are supported by usages, which could never have prevailed, but for their universal acknowledgment; and, in the repositories of their history and their laws, we find the right of the people to property in lands repeatedly acknowledged and preserved." (Extract from Report of Collector of Southern Polygar Peshcush, 29th December 1800, *Fifth Report*, Appendix, p. 828.)

d titles ng the dus.

It was extremely natural for those who had succeeded to the rights of the sovereign to exaggerate the extent of those rights, and to believe in the convenient doctrine of his proprietary title to the land. But although many ancient rights were unquestionably trampled down and for ever lost in the violence of the Mahommedan conquest, yet recent investigations have discovered, amidst the ruins of Hindu institutions, many relics of ancient manners, and the clearest titles of individual proprietors to the possession of the soil. In carrying into effect the permanent settlement by Lord Cornwallis of the land revenues in Bengal, the collectors were embarrassed by the claims of the petty talookdars, who insisted on a hereditary right of property in the soil; and the maliks, who with vehemence urged the same claims, and affirmed that the zemindars and talookdars had no deeds to show that could deprive them of their just rights. They claimed the land as their paternal inheritance, and refused to settle for the public revenue on any other terms than as proprietors. The collector was deeply impressed with the justice of their claims; and Mr Rickards, in his masterly work on Indian finance, affirms that the maliks were really proprietors, stripped of their rights by the usurpations and exactions of the zemindars and their aumils or collectors.[1] In the district of Dacca, the private rights of property were found to exist in their full force; even the unproductive jungle and waste around the town was claimed by individuals, "who," says the collector, "though they receive no profit from it, and are too indolent themselves to make it productive of any, will not suffer others to bring it into a state of cultivation without some recompense; and so very tenacious are they of it, that even in the suburbs of the city, which for three or four miles is almost an impenetrable jungle, infested by wild ferocious animals, a man cutting down a single tree will be sued by the proprietor for damages."[2] A clearer idea cannot possibly be conveyed of the rights of property, and of the solid foundation on which they rest in Bengal, as in all other countries. The accurate researches of Colonel Todd, who drew his information not merely from written records and deeds, but from the more durable tablets of stone found amidst the ruins of the fallen pile, have laid open the ancient tenures and institutions of Northern India; and in his lively delineation of those ancient manners we recognise all the peculiar features of the feudal system. There were in Rajast'han or Rajpootana two classes of landholders, the one the Grasya-t'ha-cour or lord, the other the bhoomia;[3] the first holding land by a grant from the prince on the condition of military service, "renewable," says Colonel Todd, "at every lapse, when all the ceremonies of resumption, the fine of relief, and the investiture, take place;"[4] the other an allodial proprietor, who holds prescriptive possession, who succeeds to his inheritance without any fine, though he pays a small annual quit-rent, and may be called upon for military service in the district where he resides, which is chiefly composed of the rocks and wilds that afford a refuge from oppression, and where the bhoomias, being numerous, form a species of local militia.

Landed property in the South of India.

In the southern countries of India, in Tanjore, Tinnevelly, Canara, Malabar, &c. where the Mahommedan rule had only been temporary or partial, the rights of property were not extinguished; they were indeed encroached upon, and were, as Mr Rickards observes, "in progress of actual extinction, and approached nearer and nearer to this term in proportion to the duration of Mussulman tyranny." The tyranny and exactions of Hyder Ali and his son Tippoo had nearly extinguished all proprietary rights in Mysore and in Malabar; and most of the Hindu landholders were compelled to seek refuge in Travancore. "I was," says Mr Rickards, "personally acquainted with some who, from the same causes, deserted their estates, and retired for safety into Coimbetoor."[5] But those rights were not obliterated, and the investigations of the British functionaries, skilled in the native languages and manners, brought to light in these countries the ancient condition of property, and the clearest titles of individual proprietors.[6] The notion of the sovereign's proprietary right to the whole

---

[1] See *Fifth Report*, p. 493, Copy of a Letter from the Collector of Shahabad to the Board of Revenue, dated 29th September 1789. Rickards, vol. i. chap. i. sect. iv. p. 368. *Mal*, says Rickards, is an Arabic word, denoting wealth, property, revenue, rent, particularly that arising from land; and *Malik* means master, lord, proprietor, owner of such rent.

[2] *Fifth Report*, Appendix, p. 495, Letter from the Chief of Dacca to the Board of Revenue, dated 23d July 1786. It was proposed that the government should clear away this jungle, and cultivate the land. But this "laudable plan," says Mr Day, chief of Dacca, cannot therefore be carried into effect, "without creating great dissatisfaction," as every seizure of private property necessarily does; yet he observes, that the "prejudice (*i. e.* the robbery) of a few individuals, should be no impediment to the adoption of a plan which has for its object the benefit of the community at large."

[3] The term *bhoomia* is, according to Colonel Todd, a most expressive and comprehensive name, importing absolute identity with the soil; *bhoom* meaning land. (Todd, vol. i. p. 168.)

[4] *Annals and Antiquities of Rajast'han*, by Lieutenant-Colonel James Todd, vol. i. p. 164.

[5] Vol. i. p. 283.

[6] See *Fifth Report of Select Committee*, p. 714, Report of Mr Place respecting the land tenures in the Jaghire; Report of Mr Hodgson on the revenues of Tinnevelly, *Fifth Report*, p. 832; Report on Revenues of Dindigul, p. 978. Mr Place at first agreed to the favourite theory that the sovereign was lord of the soil, and that the occupants of land in India were mere tenants at will. But on further inquiry, he was convinced that the *meerassadars* were hereditary proprietors. Report of Collector of Tanjore and Trichinopoly, 8th September 1805: "Immemorial usage," he observes, "has established, both in Tanjore and Trichinopoly, that the occupants, whether distinguished by the names of *meerassadars* or *mahajanums*, have the right of selling, bestowing, devising, or bequeathing their lands in the manner which to them is most agreeable." "It is fortunate that, at the moment when we are consulting on the means of establishing the property and welfare of the numerous people of these provinces, we find the lands of the country in the hands of men who feel and understand the full rights and advantages of possession; who have enjoyed them, in a degree more or less secure, before the British name was known in India; and who, in consequence of them, have rendered populous and fertile the extensive provinces of Tanjore and Trichinopoly. The class of proprietors to whom I allude are not to be considered as the actual cultivators of the soil; the far greater mass of them till their lands by means of hired labourers, or by a class of people termed *pullers*, who are of the lowest, and who may be considered as the slaves of the soil. The landed property of these provinces is divided and subdivided in every possible degree. There are proprietors of 4000 acres, of 400 acres, of forty acres, and of one acre."

produce of the land was interwoven with the Mogul system of finance, and the East India Company had always acted on the same maxims. Accordingly, Mr Place and others, when they entered on the management of the Jaghire, Canara, Malabar, &c. were prepossessed with the same ideas, and gave the most liberal interpretation to the Company's proprietary rights, considering the occupants and cultivators of the land as mere tenants at will. But they were soon undeceived by glaring facts. They found that the possessors of the land had the right of selling, bestowing, devising, or bequeathing their lands, in whatever manner they might deem expedient; that the lands, whether they belonged to villages, and were cultivated in shares by their common labour, or to individuals, were their absolute property, of which they could only be deprived by an act of violence. This proprietary right was termed *meerass*, a Persian or Arabic term for land;[1] and the proprietor a *meerassadar*. "Whatever may have been the origin of these rights," says the Fifth Report (p. 105), "they are regarded by the people as hereditary rights," and were, according to the Hindus, far more ancient than the Moorish conquest. Estates were found to consist of from 4000 to one acre of land; and where they were large, or were divided amongst a numerous proprietary, they were tilled by *parakudis* or *pyacaris*, who were paid for their labour, and who possessed hereditary rights of occupancy as cultivators. Common labourers were also occasionally hired; and slaves are numerous all over the country, attached to the soil, and in a state of villenage, as were formerly the cultivators in Europe. In Canara, the same rights of property exist in the land; and the proprietors are known under the appellation of *nair mul guenies*, who, like the meerassadars, have tenants in perpetuity, or *shud mul guenies;* and tenants at will, or *chalie guenies*. Of these tillers it is observed in the Fifth Report of the Select Committee on the affairs of the East India Company, that "the lands in general appear to have constituted a clear private property, more ancient, and probably more perfect, than that of England. The tenure, as well as the transfer, of this property, by descent, sale, gift, and mortgage, is fortified by a series of regular deeds, equally varied and curious, and which bear a very strong resemblance in both parts of the country. The proprietary right is either vested in individuals, or in copartnerships of persons, each of whom possesses an unalienable interest in the estate, proportioned to the share of the property of which he has become possessed."

There is another class of landholders in Malabar, denominated *jelmkars*, or *jenmkars*, who possess allodial rights, acknowledging no superior, and who were exempt from the government-tax.[2] When Hyder conquered the country, his first act was to declare half the produce of the soil to belong to the sovereign; and it was in this manner that in Hindustan all private rights were trampled upon and gradually obliterated. But these exactions of tyranny are not to be confounded with the legal claims of the state. Mr Hodgson, in his report on the revenues of Coimbetoor, justly observes, that whatever abuses took place under the Hindu or Mahommedan princes, "what was fair assessment, and what was exaction, was well known to the party governing and those governed."[3] From all this concurring evidence, it is clear that the sovereign's proprietary right in the soil was in Hindustan, as in Europe, more nominal than real; that prior to the Mahommedan conquest the land was divided amongst individual proprietors, and that the bhoomia of Rajpootana, the malik of Bengal, the meerassadar of Southern India, the nair mul guenies of Canara, and the jelmkars of Malabar, were all hereditary landholders, with legal rights, of which they could only be dispossessed by the violence of despotic power.

The Mahommedan conquest subverted most of the ancient rights and titles of the Hindu landholders, and introduced into Bengal the title of zemindar or landholder, from the Persian word *zemin*, land; respecting whose rights and duties so wide a difference of opinion has prevailed. Without entering further into this controversy, which, as respects the zemindar, is more a speculative than a practical question, it may be observed, that the zemindars had lived for centuries in great splendour on the produce of their lands, which had quietly descended under the existing tenure through successive generations; that they had the power to sell, to alienate, or to mortgage; and that as long as they paid the annual tribute to government, they enjoyed secure possession of their lands. Under a despotic government arbitrary ejectments might no doubt occur; but these were rare, and they were universally regarded, both in law and in usage, as the illegal outrages of abused power. It is admitted on all hands that these rights belonged to the zemindars; and the only point that still remains in dispute, and it does not appear very material, seems to be, whether, according to the theory of the Mogul constitution, the receipt of the land-tax by the sovereign, or of his allotted share of the produce by the zemindar, entitled the one or the other to the character of proprietor of the land.

The zemindars, being bound to the state for the revenue, were necessarily invested with the power of collecting the land-tax from the subordinate landholders and tenants. They united, in this manner, legal authority with the possession of property, whilst, as judges and magistrates, they administered both civil and criminal justice, and were held responsible for all crimes committed within their respective boundaries. These powers they frequently abused, and oppressed the inferior landholders, the talookdars and the ryots, the hereditary cultivators, or, as others consider them, the proprietors of the land, by the most cruel exactions. It was to the principal landholders that government looked for the discharge of its demands, whilst the inferior occupants and tenants were bound each to his immediate superior for their several proportions of the stipulated tax.

There were various other tenures by which lands were held in Bengal, namely, the Jaghire, Altumgha, Muddud Mash Ayma, and others. The first were grants of land on the condition of military service, or for the support of garrisons or any other public establishment, especially of a military nature. This would appear also to have been the conditions of the zemindary tenure, as Mr Rickards states that the zemindars of Bengal are expressly mentioned in the

---

[1] This term of *meerass* was introduced by the Mohammedans. "Swastrium," says Mr Hodgson, "is the Sanscrit word, and is generally used by the Brahmins; and *caneatchy* by those Shudras (cultivating castes) who may not have adopted the general term *meerass*." (See *Fifth Report*, Appendix, p. 832, Extract from Hodgson's Report on the Revenues of Tinnevelly, 24th September 1807.) Caniatchikedar is possessor or proprietor, and fully answers to jelmkar. (See p. 833, *Fifth Report*, Mr Hodgson on the Revenues of Dindigul, 28th March 1808.)

[2] *Jelmkar* or *jenmkar* means an allodial proprietor; the term *jenm* meaning properly allodial right.

[3] *Fifth Report*, p. 834. "Neither the Hindu nor Mussulman government appear (supposing their right in the soil as proprietors to be indisputable, and proprietary right to be a right to demand what the proprietor pleases for his land) ever to have exercised the right. What was fair assessment, and what was exaction, was well known to the party governing and those governed. It is true, where, as under Tippoo Sultaun's reign, exaction had no limit, landed property could have no value; but where fraud could not counteract oppression, a hope of change for the better, or inability to resist, produced submission, till the load became too heavy to bear, and emigration the only source of relief."

Ayeen Akberry as furnishing their several contingents of cavalry, infantry, and artillery. The Altumgha grant, according to the terms of it, was in perpetuity. The other grants were for the support of learned men, or religious establishments. Many of the public functionaries of the Company denied the validity of these grants; they estimated the average loss, as it was called, as if there could be any loss where there never was any right, on these grants in Bengal and the ceded provinces at two and a half millions sterling, and contended that they were resumable, and were often actually resumed, at the pleasure of the prince. Colonel Todd, however, mentions, that in Rajpootana this right of resumption had fallen into disuse. "The right to resume," he observes, "may be presumed to exist; while the non-practice of it, the formalities of renewal being gone through, may be said to render the right a dead letter;" and, quoting a passage relative to the fiefs in Europe, that they were first moveable or resumable at pleasure, then perpetual or for life, and finally hereditary, he adds, "this is the precise gradation of fiefs in Mewar, a division of Rajpootana. There is reason to believe that these grants were in a progress to permanency all over India." But all permanent property in land was discountenanced by the policy of the British in India, who were perpetually picking holes in the tenures by which it was held, even where the deed of grant expresses in the plainest terms that it is perpetual, "from generation to generation."[1]

Div n of t cou y int -lage

The country of Hindustan is divided into villages or districts, each comprising some hundreds or thousands of acres of arable and waste land. Every village is a separate community or township, and has its own establishment of public officers and tradesmen. These consisted of the *potail*, or head inhabitant, whose business it was to superintend the affairs of the village, to settle disputes amongst the inhabitants, to attend to the police, and to the collection of the public tax; the *curnum*, to whom it belonged to keep an account of the cultivation and produce of the land, to register the proprietors of the village, and to attest all deeds of sale, transfer, or assignment; the *boundary-man*, who preserves the limits of the village, or gives evidence of them in case of dispute; the priest, the schoolmaster, the astrologer; the smith, the carpenter, the potter, the washerman, the barber, the cowkeeper, the doctor, the dancing-girl, the musician, the poet, who were each rewarded for their labours out of the produce of the village lands. The amount of their shares on the gross produce is estimated at five and a half per cent. The collectors were allowed ten per cent., and the remaining proportion of the crop was divided between the sovereign and the cultivator, in the proportion of ten elevenths to the former, and one eleventh to the latter. "Under this simple form of municipal government," says the Fifth Report, "the inhabitants of the country have lived from time immemorial. The boundaries of the villages have been but seldom altered; and though the villages themselves have been sometimes injured, and even desolated, by war, famine, and disease, the same name, the same limits, the same interests, and even the same families, have continued for ages. The inhabitants give themselves no trouble about the breaking up and division of kingdoms; while the village remains entire, they care not to what power it is transferred, or to what sovereign it devolves; its internal economy remains unchanged; the potail is still the head inhabitant, and still acts as the petty judge and magistrate, and collector or renter of the village." So deeply attached are the Hindus to their native villages and local manners, that, however they may be scattered by the desolation of war, their affections still centre in one common and cherished spot; insomuch that, in 1817, as is mentioned by Sir John Malcolm, and as has already been noticed, when peace was re-established in Central India, by the expulsion of the Pindarees and other freebooters, who laid waste the country, the inhabitants and officers of the villages re-assembled from every quarter, and the resurrection of these communities into life and action seemed to have been the work of an instant.

Land-tax.

The land-tax of the village is collected by the potail, assisted by a train of petty officers or under collectors, the putwarries, the peons, the pykes, and others, whose salaries form a deduction from the gross rent. The potail pays his collections to the zemindar, from whom they were received, under the Mogul government, by a higher officer, and finally remitted to the imperial treasury. The accounts of the *curnum*, or the *canongoe*, were also transmitted through various gradations of accountants, who superintended and checked the collection and receipt of the public revenue. In the year 1573, during the reign of Akbar, when the Mahommedans had completed the conquest of Hindustan, Rajah Torrel Mull, minister of finance to the emperor, from the accounts furnished by the canongoes and collectors of the revenue paid by the ryots, formed a general rent-roll for all the country, as well as a scheme of division, fixing the separate proportions of districts and villages. The revenue thus settled, and usually called *tumar jumma* (rent), or standard assessment, is estimated by Sir John Shore at

[1] Colonel Munro, a great authority on all Indian questions, in a paper of remarks on a decision of the chief justice of Madras respecting a jaghire estate that was resumed by the Company, argues, from the arbitrary practices of Indian princes in taking away these rights, that no such rights exist, although they are defined in the clearest terms. "The grant," he observes, "is in the usual form,—'to be enjoyed by him and his descendants *for ever, from generation to generation.*' He is authorized to divide it among his descendants; and the local officers are required to consider the perwannah 'as a most positive peremptory mandate, and not to require a fresh sunnud every year.' The terms employed in such documents, 'for ever,' 'from generation to generation,' or, in Hindu grants, 'while the sun and moon endure,' are mere forms of expression, and are never supposed, either by the donor or the receiver, to convey the durability which they imply, or any beyond the will of the sovereign. The injunction with which they usually conclude—'Let them not require a fresh sunnud every year,' indicates plainly enough the opinion that such grants were not secure from revocation." (In Consultation, 15th March 1832.) The language here may be a "mere form of expression," yet it is impossible to frame in words a clearer legal title; and the doubt is, whether the subversion of such a title, however common amongst the despotic princes of Hindustan, ought not to be regarded as a tyrannical act rather than a legal precedent. No landed proprietor would, with such a title, surrender his estate, except to the power of the strongest. Custom may have rendered such acts familiar to the prostrate people of Hindustan; but if words like these are to be held as mere official forms, it is clear that no legal title to property can exist in India. Sir Thomas Munro mentions several examples of land held under common jaghire grants descending through several generations. He still insists, however, that, by the invariable custom of the country, they are resumable at the pleasure of the prince, though it seems extremely doubtful how far the practice of a despotic government in resuming lands can be received as a precedent against such a clear legal title.

The arbitrary taxes termed Abwabs, added to the original standard assessment, consisted of duties on the transit of goods through the different chokies or toll-bars of the country, of taxes on cattle and stock of every description; of a capitation tax; of a tax on shops, manufactures, or stock in trade; and of fines and other arbitrary exactions; and, in proportion to the demands made on the zemindar, he was empowered to augment the contribution of his tenants. The standard revenue of Torrel Mull, amounting to L.1,202,979, appears to have been all that the country could bear; for, inconsiderable as was the augmented revenue of Jaffier Khan, it was only obtained by the most cruel tortures inflicted on the zemindars, many of whom he confined in pits filled with ordure, which he termed in derision Bykaut, or Hindu Paradise. In the reign of Meer Cossim, who was set up by the English, to whom he promised large sums as the price of his elevation, these oppressions were carried to a still greater height. The policy was to ascertain, by exact money, the produce of the land; and the whole surplus, after allowing a bare maintenance to the cultivator, was swept into the treasury.

English invested with the sovereignty of Bengal.

Although the ascendency of the English had for some years been thoroughly established in Bengal, and although they were formally invested in 1765 with the sovereignty of the country, its affairs were still administered in the name of the native prince, and according to the forms and policy of the ancient constitution. Justice was still dispensed by the native courts, and by the nabob's officers; the revenues still flowed through the same channels into the public exchequer; and all transactions with foreign powers were carried on under the same authority as formerly. But such was the increasing power of the English, that the government, as far as regarded the protection of the people, was dissolved. Neither the nabob nor his officers dared to offer any opposition to their sovereign will; and the tribunals of justice, so far from being a refuge to the oppressed, became subservient to the rapacity of the gomastahs, or Indian agents, employed by the Company's servants, and were converted by them into most efficacious instruments for oppressing and plundering the people.

The directors had been long dissatisfied with the proceedings of their servants, and with the produce of the land revenues, which had fallen far short of their expectations, and they now resolved to put an end to the double administration of the nabob and the Company; and, dispensing with the empty name of the former, to take upon themselves, ostensibly as well as really, the entire care and management of the land revenues. The dewanny of Bengal, Bahar, and Orissa, or the office of collector of the public revenues, which in the East implies the right of sovereignty, was conferred in perpetuity on the East India Company by a grant from the Mogul Shah Aulum, dated the 12th of August 1765. The assessment imposed on the country by Cossim Ali is stated by Sir John Shore to have been mere "pillage and rack-rent;" and it was an assessment on paper, as, out of the sum of L.2,882,724, there remained a balance undischarged of L.1,987,054, notwithstanding the cruelty with which the collection had been enforced. It was found necessary to reduce the assessment, in 1763-64, to L.1,991,785, out of which the sum realised was only L.857,070.[1] In 1765-66, the first year of the Company's administration, the assessment was 16,029,011 rupees, equal to L.1,803,263, of which 14,704,875 rupees (equal to L.1,803,263) were actually collected. In 1765 the assessment imposed amounted to L.1,692,237, and in 1766 and 1767 it amounted to L.1,713,677, from which deductions were afterwards made, as it was found impossible to collect it. Yet the sum actually realised was greater than ever was extorted from the country by all the cruelties of Jaffier Khan. But the methods by which it was collected were most ruinous. The landholders, failing almost universally in their engagements, were left to the mercy of the revenue-officers, by whom they were grievously oppressed. In many parts, the villages were deserted by the cultivators, and the land was left desolate. All these evils were still farther aggravated by a grievous famine which prevailed in Bengal in the year 1770, by which it is computed that about one third of the inhabitants perished. But, in the midst of all this misery, the revenue was still violently kept up to its former standard. The deficiencies occasioned by the famine were re-assessed on those who survived this calamity; and so strictly were they levied, that the land revenue for that year exhibited an increase above that of the year preceding. The ruinous effects of this heavy exaction are stated at length in the different letters from the governor-general to the directors. In a letter, dated the 3d of November 1772, he observes, "It was naturally to be expected that the diminution of the revenue should have kept an equal pace with the other consequences of so great a calamity; that it did not, was owing to its being violently kept up to its former standard." He then describes the method by which this was accomplished, which was by "an assessment upon the actual inhabitants of every inferior division of the lands, to make up for the loss sustained in the rents of their neighbours, who are either dead or have fled the country." "The tax," he continues, "not being levied by any fixed rate or standard, fell heaviest on the wretched survivors of those villages which had suffered the greatest depopulation, and were of course the most entitled to the lenity of government. It had also this additional evil attending it, in common with every other variation from the regular practice, that it afforded an opportunity to the farmers, or shiedars, to levy other contributions off the people under colour of it, and even to increase this to whatever magnitude they pleased, since they were in course the judges of the loss sustained, and of the proportion which the inhabitants were to pay to replace it." To the same effect, Mr Middleton, one of the superintendents of the public revenue, observes, "When a very considerable portion, supposed even a third of the whole inhabitants, had perished, the remaining two thirds were obliged to pay for the lands now left without cultivators. The country has languished ever since, and the evil continues enhancing every day. The first remedy, without the adoption of which all other measures will be fruitless, is an universal remission of some considerable portion of the revenue throughout the provinces. Such remission should have been made immediately on the famine. Its not taking place then has made it more and more necessary every day; and the longer it is delayed, the more ruinous the consequences must be to this country and its revenue."

To correct these evils, supervisors, chosen from the Company's servants, were in 1769 stationed in different parts of the country, to superintend the native officers in the collection of the revenue and in the administration of justice; and two councils were appointed over the supervisors, one at Moorshedabad and another at Patna. These supervisors were instructed to procure information respecting the amount of the land revenues, the manner of collecting them, the amount of the cesses or arbitrary taxes, the origin and progress of those modern exactions, and also to inquire concerning the regulations of commerce and the administration of justice. The reports made by these supervisors concurred with all the other evidence received as to the wretched and oppressed state of the natives. "The nazims," they observed, "exacted what they could from the zemindars and great farmers of the revenue, whom they left at liberty to plunder all below; reserving to themselves the prerogative of plundering them in their turn, when they were supposed to have enriched themselves with the spoils of the country."

---

[1] See Sir John Shore's Minute, *Fifth Report*, p. 176.

It was now resolved to make a settlement of the land revenues for five years commencing from the year 1772. For this purpose, a committee of the board, consisting of the president and five members, named the "Committee of Circuit," was appointed, who were to make a journey through the country, and were empowered to receive proposals for a new lease of the lands, first from their ancient possessors, and if their offers were deemed unsatisfactory, they were to be let by public auction to the highest bidder. These persons proceeded in their circuit through the country, publicly advertising and letting in farm, for the highest rent that could be obtained, the estates of such as hesitated to contract for the assessment proposed. A great proportion of the landed property throughout Bengal was thus exposed to auction; and, in the general sale, the former owners and the great nobility of the country were outbidden by adventurers, to whom property was acceptable on any terms; and were generally dispossessed of their lands, from the surplus produce of which a provision was assigned them by the indulgence of the revenue committee.

The supervisors who had been stationed in the different districts were invested with the necessary powers for the collection of the revenue, and were henceforth denominated collectors. A native officer was to be joined with them under the title of duan, to confirm and to check accounts, and to assist in all those multifarious details which were intelligible only to a native. Various regulations were adopted to check the exertions of the collectors; but the governor and council express their regret that it was not in their power wholly to remedy this evil. Under the Mogul government, the duty of collecting the revenues and of administering justice was united, as formerly mentioned, in the person of the zemindars. The new scheme for the management of the revenues subverted this ancient order of things. The zemindar was superseded both as collector and as judge, and his place was supplied by two courts, the one for civil, called the Dewanny Court, the other, called the Fonjdarry Court, for criminal proceedings, established in each district. In the criminal court the new collector of taxes was to act as president, to be assisted by two Mahommedan officers, the cauzee and the muftee, and by two Mohlavies, as interpreters of the law. The civil court consisted, in like manner, of the collector as president, assisted by the duan and other officers of the native court. Two supreme courts were, at the same time, established at Calcutta, for the review of the inferior courts, the one for civil cases, being called Dewanny Sudder Adawlut, and the other the chief court of criminal justice, or Nizamut Sudder Adawlut. To one of these all capital cases were reported, and were ultimately referred to the governor and council, who, finding the labour too great, restored, in 1774, this branch of administration to the nominal nabob, and carried back the court to Moorshedabad. It appeared that, for a long period before this, the administration of criminal justice was wholly at a stand. In the new arrangements all disputes about property not exceeding ten rupees in value were referred to the head man of the district to which the parties belonged.

In considering those regulations, the question naturally occurs, how these supervisors, who were now to act in the double capacity of collector and judge, became qualified for the discharge of such important functions. In all other countries, it is only by a previous course of laborious preparation that any one is qualified for the office of a judge; and to appoint an unqualified person would be reckoned both dangerous and absurd. But how much more dangerous and absurd was it to appoint uninstructed persons to act as judges in a foreign land, with whose language they are but imperfectly acquainted, and of whose laws, manners, and customs, they are thoroughly ignorant? If, among a comparatively rude people, the mode of proceeding be loose and arbitrary; if there be no books of written law, or of precedents to govern judicial decisions, which must consequently depend on the imperfect lights and analogies afforded by manners, religion, or customs, the incapacity of a foreigner for the discharge of such nice duties becomes even more glaring. By disposing of the administration of justice in this manner, it was clear that the judicial duties would either be neglected, or that they would still be performed as before, and with no increased chance of amendment by native officers. This new arrangement was, therefore, like many others, a useless innovation on the established practice of the country. There is another weighty objection to the union in one person of the duties of collector and judge, namely, that it was in the collection of the duties that the grossest oppression had been committed; the powers of the collectors being frequently perverted to the most iniquitous ends. Under this new project, those who sought redress from the courts of justice met with their oppressor in the capacity of judge. He judged in his own case, and of complaints brought against his own conduct. Justice was in this manner an empty name, unless it was supposed that the judge would pronounce himself an oppressor.

Under the five years' lease on which the land revenues had been farmed in 1772, the country was grievously overtaxed. The revenues fell into a heavy arrear the very first year, and the lands were let on a progressive rent. To collect the outstanding balances, and to force up the revenue to its standard, a host of extortioners was, under the name of aumils, or collectors, let loose upon the afflicted country. But the rents contracted for by the farmers of the revenue were greater than they could pay, and, notwithstanding all their efforts, the arrears continued to increase. On the five years' lease, they amounted to a sum equal in value to L.1,454,277, which was judged to be wholly irrecoverable; while, during the same period, the sums remitted, even under the rigorous management of public farmers, amounted to L.1,336,451. Nor was this the only evil arising from the mal-administration of the Company's servants. The zemindars, who are admitted on all hands, even by those who advocate the sovereign's right to the possession of the soil, to have lived in splendour on their hereditary possessions; in all cases to have possessed the powers of magistracy within their district, and, where the territory was large, to have exercised a species of sovereignty; were either despoiled of their estates, or, where they were induced, by a hereditary attachment to their possessions, to engage for the rent proposed, they were overwhelmed with taxes which they could not pay, and were thus involved in poverty and ruin. Where the zemindar was himself the farmer of the revenue, he exercised the same extortion on his inferiors which was applied to himself; where a money-jobber, having no interest whatever in the property of the tenants, was the farmer, there was no limit to his extortion and cruelty.

The defects in this system for the administration of the land revenues soon began to disclose themselves; and the rulers of India, whose government was one continued innovation, immediately resolved to make another considerable change in the state machinery which they had just set in motion. They abolished the superintendence of the collectors; and the country, with the exception of Chittagong and Tipperah, being formed into six grand divisions, viz. Calcutta, Burdwan, Moorshedabad, Dinazepore, Dacca, and Patna, a council was appointed for each of the last five, consisting of a chief and four senior servants, to whom were transferred the powers and duties of the collectors. They were to preside in the courts of justice, and to superintend the collections; and, in subordinate districts, they delegated their powers to naibs or aumils, who were natives, and who were appointed, like their superiors, to collect and to judge in all cases under the value of 1000 rupees. The empty privilege of appeal was, as formerly, reserved to the unsuccessful suitor in the provincial courts; and, to superintend the whole collections of the country, a grand revenue-office was established at the presidency. The district of Calcutta was placed under the peculiar superintendence of a committee of revenue, consisting of two members of the council and three inferior servants. These regulations, which were declared to be temporary, and only preparatory to something more permanent, failed as usual in all their important objects. The defective administration of justice amongst the natives was admitted and complained of by all parties, and the peace of the country was in consequence disturbed by the general prevalence of robbery and other enormous crimes. The truth is, that the new arrangements had subverted the ancient institutions and local manners of the country, and had thus left a void in its internal economy which the government was in vain endeavouring to fill up.

The lease of the lands expired in 1777; and, after various suggestions and consultations, it was resolved that the rent should be regulated by the average collections of the three preceding years, and that the lands should be let, not by auction, but by an agreement with their ancient possessors in preference to other competitors. The liberal views of Mr Francis, who proposed that, in lieu of the monopoly of salt and opium, a moderate duty should be imposed on those articles, and that a long series of oppression should thus be terminated, by giving freedom to trade, were rejected by the governor-general. In pursuance of the plan proposed, the lands were let from year to year until the necessary arrangements could be completed for the system which was now to be adopted of a permanent land-tax.

The attention of the British parliament had frequently been directed to the state of our Indian possessions, and to the transactions of the resident government; and, in 1784, a new system, of which we have already given an account, was established in Britain for the control of the local administration, under which Lord Cornwallis, who was chosen governor-general, was specially directed by the act of parliament, as well as by instructions from the directors and the board of control, "to inquire into the alleged grievances of the landholders, and, if founded in truth, to afford them redress; and to establish permanent rules for the settlement and collection of the land revenue, and for the administration of justice, founded on the ancient laws and local usages of the country."

Lord Cornwallis, on his arrival in India, did not deem matters fully ripe for the execution of the proposed plan, namely, the permanent settlement of the land revenue. On this important subject he found that the most intelligent of the Company's servants differed widely in opinion. Neither the nature of the land tenure, nor the rights of the different orders of people who shared amongst them the produce of the soil, were well understood. All that was distinctly known was the amount of the revenue; but whether it was too high or too low was still a disputed point amongst the English in India, although the country was visibly declining under the weight of assessment. In such diversity of opinion, the governor-general, anxious to proceed with caution, delayed for a little the plan of a permanent settlement. He let the lands, in the mean time, from year to year, through the agency of the district collectors; and information on which to found a more durable arrangement was diligently sought from every source.

Perma- nent se- tlemen of Lor Cornw

In 1799, Lord Cornwallis had resolved on the permanent settlement of the land revenues. This he conceived to be essential to the relief of the country, the condition of which he described to be wretched in the extreme. "I am sorry," he observes, "to be obliged to say, that agriculture and internal commerce have for many years been gradually declining; and that at present, excepting the class of shroffs and banyans (bankers and merchants), who reside almost entirely in towns, the inhabitants of these provinces are advancing hastily to a general state of poverty and wretchedness. In this description I must even include every zemindar in the Company's territories, which, though it may have been partly occasioned by their own indolence and extravagance, I am afraid must also be in a great measure attributed to the effects of our former system of management." "I may safely assert," adds he, "that one third of the Company's territory in Hindustan is now a jungle, inhabited only by wild beasts." In pursuance of his plan, Lord Cornwallis entered into a permanent settlement of the land revenues for ten years, which was afterwards declared unalterable; and the zemindars of Bengal, Bahar, and Orissa, were formally constituted legal and perpetual proprietors of their respective estates, on the payment of a fixed rent to the state. The ten years, or, as it is called, the *decennial settlement*, was completed in every district in 1793.

Its defe

In regard to this measure, there cannot be a doubt, that in abolishing a land-tax, increasing at the discretion of the government with the produce of the land, Lord Cornwallis acted upon a just principle. But the advantage of a permanent tax depends on its amount. If it be a moderate tax, its permanency is an advantage; but not so if, as in this case, it was exorbitant, higher than the land could bear, and inconsistent with the progress of cultivation. The legislators of India had not yet acquired the necessary knowledge of the country for such a measure. They had no data on which they could, with any certainty, adjust the tax to the capacity of the soil; and, after long discussions, it was at length fixed at the average amount of the collections for the last three years. In the division of the produce, accordingly, two fifths were, as before, allotted to the ryots, after deducting the expense of collections; of the remaining three fifths, constituting the rent of the estate, ten elevenths were taken as the government share, and one eleventh left to the zemindar. If we suppose, therefore, an estate of which the gross produce is L.1000 a year, the respective shares of the three claimants will be, L.400 for the ryots, L.540 for the government, and the remaining L.60 for the zemindar. In scarcely any instance, however, were these proportions practically enforced. But the tax was exorbitant. During the three preceding years, the average collections of which had furnished the standard of the assessment, it had been a general complaint that the country was overtaxed; and to this cause was ascribed its misery and decline. From this high standard of taxation no systematical reduction has ever been made. Arrears, which had been long accumulating, and which could not be recovered, had indeed been remitted; but every method of extortion had been practised, in order to realize as large a revenue as possible; and the country was now charged with a permanent assessment, founded on the actual revenue of those years, which was exorbitant, and greater than the land could bear; and this radical defect, even if there had been no other, would have ensured the failure of the plan. The zemindar, who was bound, in the first instance, for the public tax, depended, for the means of discharging it, on the produce of his rents; and the state, by imposing an immoderate tax on him, laid him under the necessity of plundering all below him.

There was another defect in the decennial settlement, that it provided no security for the under-tenants and ryots in the hereditary privileges which they claimed in the soil. As they varied in different places, and depended on different rules, the subject appeared to involve details too intricate for European management; and the important task of settling with the ryots was, therefore, devolved upon the zemindars, with a mere general recommendation to be guided by the custom of the place, and to give the ryot a written copy of his lease. According to this plan, it was the great proprietors only who had any permanent interest in the lands, while the inferior proprietors and tenantry were at the mercy of the principal landholders, who might exact from them whatever they pleased. The under-tenants and cultivators, in this ill-defined state of their rights, had no interest whatever in the improvement of the soil, being well assured that they would in no case be left more than a bare maintenance; and this was one among the other errors of the settlement, that it was made entirely with the zemindars, who were notoriously ignorant, oppressive, and corrupt. Maliks and other inferior landholders were crushed, and the just titles of the talookdars and ryots were extinguished; they were placed in the power of the zemindars, on whom alone the government relied for the improvement of the country; though no country was ever yet improved by its great lords, who are generally inactive, wasteful, and improvident. The putwary or hereditary officer of the village was now made a servant of the zemindar; and the office of canongoe, the hereditary village accountant, was abolished, and his land resumed, that is, seized by the government. Though humanely intended, therefore, the plan was calculated to entail ruin upon the higher classes of landholders, by the tax which it imposed on them; while by necessitating them, and at the same time giving them the power, to oppress all below them, in order to satisfy the exorbitant demands of the state, it necessarily had the effect of extending this ruin downwards to the lowest tenant. Its effects have entirely corresponded to this view of its principle.[1]

Co-
qu es of
the x.

It soon appeared, that, in order to realize the revenue, it would be necessary to sell the lands; and this evil once begun, continued to increase. The revenue was not punctually paid, and, for the recovery of outstanding balances, lands to a great amount were at stated times exposed to auction. In the year 1796–97, the lands advertised for sale bore a rent of 2,870,061 sicca rupees (L.332,927), and those actually sold yielded an annual rent of 1,418,756 rupees (L.164,576). In 1797–98, the quantity of lands sold bore a rent of 2,274,076 rupees (L.255,833), and it is observed in the Fifth Report, p. 56, that "among the defaulters were some of the oldest and most respectable families of the country;" "the dismemberment of whose estates," continues the Report, "at the end of each succeeding year, threatened them with poverty and ruin, and, in some instances, presented difficulties to the revenue officers in their endeavours to preserve undiminished the amount of the public assessment." In order to check those evils, several alterations were made from time to time by Lord Cornwallis. But they appear to have been unavailing; and, in the year 1802, in a report from one of the collectors, we have the following melancholy picture of the state of the country:—" 'All the zemindars,' it is observed, 'with whom I ever had any communication, in this and in other districts, have but one sentiment respecting the rules at present in force for the collection of the public revenue. They all say that such a harsh and oppressive system was never before resorted to in this country; that the custom of imprisoning landholders for arrears of revenue was, in comparison, mild and indulgent to them; that though it was no doubt the intention of government to confer an important benefit on them, by abolishing this custom, it has been found by melancholy experience, that the system of sales and attachments, which has been substituted for it, has, in the course of a very few years, reduced most of the great zemindars in Bengal to distress and beggary, and produced a greater change in the landed property than has perhaps ever happened, in the same space of time, in any age or country, by the mere effect of internal regulations.'[1] In another part of the same document, the collector, after commenting on a regulation then recently introduced, observes, 'Before this period (1799), complaints of the inefficacy of the regulations were very general among the zemindars, or the proprietors of large estates; and it required little discernment to see that they had not the same powers over their tenants which government exercised over them. It was notorious that many of them had large arrears of rent due to them which they were utterly unable to recover, while government were selling their lands for arrears of assessment.' The collector adds, 'Farmers and intermediate tenants were, till lately, able to withhold their rents with impunity, and to set the authority of their landlords at defiance. Landholders had no direct control over them; they could not proceed against them, except through the courts of justice; and the ends of substantial justice were defeated, by delays and costs of suit.'" To the same purpose Sir Henry Strachey observes, "That the men of opulence are now all men of yesterday; that the greatest men formerly were the Mussulman rulers, whose places we have now taken, and the Hindu zemindars. These two classes are now ruined and destroyed."[2]

Waste
lands re-
assessed.

It was the intention of Lord Cornwallis to include in the permanent settlement of the land-tax in Bengal, all the waste lands, which were fertile and extensive, and which, yielding, when improved, a valuable produce, would enable the zemindar to pay the exorbitant tax upon the cultivated parts. The Europeans at this time did not know the fertility and the vast extent of those lands; and when it was discovered that the zemindars were enriching themselves by the cultivation of their untaxed wastes, it seems, as Mr Rickards observes, to have excited a notion amongst the British that they had got too good a bargain; and an error of this nature, on the side of liberality, was so monstrous an anomaly in the Company's policy, as behoved to be corrected with all due speed. Accordingly, doubts were suggested respecting the right of the zemindars to these waste lands, though they all laid claim to them as part of their assessed estates, and though it does not appear how the mere fact of their non-cultivation should invalidate or in any degree affect the title to the land.[3]

---

[2] See Answers to the Interrogatories of Government, dated 30th Jan. 1802.

[3] Mr Hodgson, in his Report on the Revenues of Tinnevelly, observes, "If the *meerassadars* (proprietors) should be unable or unwilling to procure *pyacarries* (cultivators) to cultivate that part of the meerassee (estate) which is waste, and the circar (government), or

Inquiries were from time to time made, and in 1815 commissioners were appointed, apparently with no other view than to find a flaw in the titles of the zemindars, and to resume or to seize upon these waste lands, the cultivation of which was so great a source of wealth. Thus it appears that it was no more safe to grow rich under the rule of the British in India, than under any of the native despotic states; and the too luxuriant prosperity of the thriving zemindars was accordingly pruned by the tax-gatherer's rapacious hand. It was suggested by one of those commissioners in 1817, whose inquiries, the further they were pursued, involved him in greater difficulties, that all the waste lands should, without more ado, be declared the property of government, leaving to the zemindar the tardy and uncertain remedy of proving his title to the satisfaction of those who were despoiling him of his property. The greatest difficulties were everywhere experienced in carrying this scheme of spoliation into effect. In Bahar and Benares the commissioner declared the unassessed lands to be everywhere claimed as a portion of the zemindary estate. It is clear that the permanent settlement of the land-tax in 1793 was intended by Lord Cornwallis as a full discharge of all the public dues. It was a solemn deed, by which all doubtful and conflicting claims were for ever set at rest; and to open up this settlement at the distance of twenty years, and to harass the landholders with new and undefined demands, was a breach of faith, a cruel mockery of private rights, calculated to inflict a deep wound on the prosperity of the country. Such vexatious inquiries, conducted by those who had an interest in the confiscation of the lands, terminated as might have been expected. Those which were exempted from taxation by the permanent settlement of 1793 were now resumed and assessed; and the zemindar had his remedy in a suit against the government before the British revenue courts, which generally gave judgment against him. It is mentioned in evidence before the Lords' Committee, that the proprietor of a great estate in the Sunderbunds, who had brought into cultivation an extensive waste, was called upon, notwithstanding the permanent settlement of his land-tax, to pay an additional tax on the produce of this land. He disputed the claim; but being cast in a suit before the revenue courts, he was subjected to a ryotwar settlement, and compelled to pay fifty times more than the original rent.[1] Thus the tax was not only exorbitant, but provision was made for continuing it at a rack-rent, so that there was no prospect of relief under any circumstances to the oppressed country; and thus we find extortion to be still the true feature of the Company's government. It is this grinding system of taxation, this continual desire for an improving revenue, the standard by which the zeal of the Company's servants is judged of, and promotion regulated, that defeats all the blessings that might otherwise flow from European rule; that spreads pauperism far and wide, and is the standing source of misery throughout the country.

Delay
justice

The ruin of the zemindars was partly occasioned by another cause, namely, the want of any effectual method of enforcing their claims against the small tenants. The public officer was empowered to proceed against defaulters by a summary process, and to attach and sell, by public auction, the zemindar's land for the discharge of arrears; whilst against the under-tenants the zemindar had to seek redress by an ordinary suit at law, which was both tedious and expensive. To heighten this evil, the courts of justice were overloaded with a long arrear of undecided causes, so that no decision could be expected before the lapse of years. There were in the district of Burdwan above thirty thousand undecided suits; and no decision could be expected within the ordinary duration of human life. The zemindar, in this manner, whilst he was compelled to pay, by the prompt and efficient process of government, was left to seek redress from his tenants through a labyrinth of endless litigation; and the knowledge of this impediment to justice gave great encouragement to the tenants to refuse payment of their rents. The ruin of the zemindar, therefore, was the inevitable consequence of this summary process to which he was exposed, while he could have no similar recourse on his tenants; and these regulations were universally complained of, and on the justest grounds. In an address from one of the collectors to the board of revenue, in behalf of the zemindar of Burdwan, who had in vain applied for redress to the civil courts, it is observed that he (the zemindar) begs leave to "submit to your consideration, whether or not it can be possible for him to discharge his engagements to government with that punctuality which the regulations require, unless he be armed with powers as prompt to enforce payment from his renters, as government had been pleased to authorize the use of in regard to its claims on him; and he seems to think it must have proceeded from an oversight, rather than from any just and avowed principle, that there should have been established two modes of judicial process under the same government; the one summary and efficient for the satisfaction of its own claims, the other tardy and uncertain in regard to the satisfaction of claims due to its subjects; more especially in a case like the present, where ability to discharge the one demand necessarily depends on the other demand being previously realized."

Oppression of ryots.

The system which impoverished the zemindars proved equally ruinous to the ryots. It was the practice of the zemindar to contract for a certain rent with a land farmer, who subdivided the land into smaller portions, and let it to a variety of inferior tenants. To this head farmer it appears that a written agreement was given, according to the regulations; but the under-tenants were left, without any security, to the mercy of their superiors. It is well known, and admitted by the servants of the Company, that the ryot, even when he receives written agreements from the zemindar, is liable to indirect oppressions which no law can remedy; and though, owing to the expense and delay in the administration of justice, he could retaliate on the zemindar, by refusing payment of his rents, this privilege could be of little advantage to him, whilst it tended still farther to widen the breach between the landlord and the tenant, and to add to the hatred, strife, and violent distraction of interests by which the community was now, as it were, torn in pieces. To remedy the grievances which the zemindars suffered from the evasion of payment by their tenants, it was enacted in 1799, that they might have recourse to the same summary process against defaulters, as was used by the government against themselves. They were empowered to seize the property of their tenants for arrears, previous to any legal judgment, or any proof of the justice of their claim. This regulation gave to the zemindars the power of unbounded oppression, against which the ryot had no redress, as he was effectually shut out of the courts of justice by the

---

the circar's representative, a zemindar or mootahdar, should assign the land to be cultivated to a stranger of his or their procuring, the meerassadar would consider himself proprietor of the land, claim his *sawmy bogum* (a deduction for himself of about 13½ per cent. on the gross produce), and not consider his title invalidated by his temporary inability." (See *Fifth Report*, p. 832.)

[1] See Minutes of Evidence before Lords' Committee, 26th February 1830, Evidence of Mr Mangles, p. 49.

enormous expenses of law proceedings.[1] It was undoubtedly just that the zemindar should have the same efficient process for enforcing payment as was used against himself; but such was the unhappy condition of India, under the unskilful management of strangers, that every plan of reform seemed only to increase the general disorder. Her rulers wanted intelligence for the delicate task of domestic legislation; their schemes were crude and inapplicable, nor could they ever mould the various and jarring interests of the Indian community into any consistent scheme of civil order; so that, though they were continually patching their imperfect work, it still bore the same incongruous character, and the cure of one evil was constantly followed by an irruption of other and worse evils from some other quarter.

The state of society which prevailed in Hindustan arose from the mixed operation of a peculiar system of laws, customs, manners, religion, and policy; and such an artificial structure required to be nicely and skilfully handled, instead of which it was lacerated in all its delicate parts by the rude hand of foreign interference. The English were ignorant even of the language of the people whom they had brought under their sway, and whom they now attempted to govern; and though they might know generally that the public revenues were derived from an impost on land, they were entirely inexperienced in the usages of the country, and in the financial details of the Mogul government. With what effect, therefore, could they interfere in such complicated details? how could they decide between the claims of justice and of fraud? how could they judge of cases connected with the peculiar usages of the country, and with all those minutiæ of local manners with which no foreigners can ever become thoroughly acquainted? The Company's servants, involved in such a labyrinth of complex concerns, possessed no clue to guide them to any equitable issue. Supposing their views to have been honest, they wanted intelligence to give them effect; and although they could enforce submission to their decrees, the country, under their usurped and ill-directed authority, presented one vast scene of anarchy and oppression. The directors in Europe readily ascribed all these evils to the misconduct and rapacity of their servants, which they heavily censured; and, in their correspondence with India, they express the most just, humane, and enlightened sentiments, and a sincere desire to promote the happiness of their subjects. But if they had only said to their servants "lower the assessment," these three words would have been of more avail than volumes of fine sentiment. The truth is, that extortion has all along been the vice of the Company's government. The eastern maxim of the sovereign's proprietary right to the soil was too readily adopted into their European creed, and was the ground and the excuse of immoderate assessment. The new sovereigns of India could never relinquish the idea of profit, and the wealth of India was now expected to swell the balance-sheet. The land and labour of the country were to be laid under contribution for the benefit of the mercantile proprietors in Europe. The glory of a sovereign consists in the felicity of grateful millions, and this is the only true and legitimate end of all government. But the East India Company were intent on profit, on enriching themselves at the expense of their subjects; and the duty of the servants to their masters consisted in sending home a large investment. They were to possess themselves of as large a quantity as possible of the produce of the country, giving nothing in return, and to send it to Europe to be shared amongst the proprietors; and it was, accordingly, the boast of successive administrations how well they had succeeded in this matter; not how happy they had made their subjects, but how much of their property they had taken from them and sent to Europe.

Judicial system of Lord Cornwallis

The institutions of Lord Cornwallis, for the administration of civil and criminal justice, appear to have been equally unsuccessful with his finance measures; and it soon appeared, as has already been stated, that the new courts of judicature had more business than they could manage, and such an arrear of undecided cases accumulated that the course of justice was nearly stopped. In this dilemma, the costs of suit were raised for the purpose of discouraging litigation; and this expedient being found ineffectual, they were raised a second time. To place justice out of the reach of the poorer and more numerous class, by laying a heavy tax on it, was indeed an easy and effectual method of discouraging litigation. It was, in fact, a denial of justice, a direct refusal to hear the complaints of the poor, who might, therefore, be harassed for ever after with impunity. Notwithstanding this discouragement, however, the evil went on increasing, and at last amounted to an almost total dissolution of civil order. As no decision was to be procured before the regularly-constituted tribunals, every man began to arm himself in his own quarrel, and the country thus became the scene of bloody affrays between armed individuals, unhappily left without any other resource for the decision of their differences. In some of those conflicts 4000 or 5000 persons were arrayed on each side, and many lives were lost. In a letter of the court of directors, dated October 1814, it is observed, "As to affrays respecting the possession and boundaries of lands and rents, this has been long a serious evil, and must, we conceive, have existed in a greater or less degree in every part of the country." "These affrays," continue the directors, "which often lead to homicides and woundings, have been very naturally ascribed by several of the judges to the difficulty of obtaining judicial redress."[2] In the district of Tirhoot, where the public peace had been frequently disturbed by those private feuds, the judge for the division of Patna observes, that they chiefly "arose from the accumulated arrears of suits," and "that the parties finding a delay in obtaining redress, had resorted to force."[3] Mr Melville, also a judge in the division of Dacca, expresses himself to the same purpose. "With respect to affrays," he observes, "attended with homicides and wounding, it is known that those disorders arose from attempts to retain by force possession of lands, or rents of lands, to which the different parties alleged separate claims." The same person afterwards states, that "in Chittagong, they (meaning these quarrels) had not only been frequent, but violent; that the police authority had been often resisted, and in one instance overpowered; that it would be wrong to disguise the length of time a claimant must wait, with the sacrifices he must make, before the decision of a civil court can be obtained."

Penal judicature and police.

We shall now briefly advert to the system of penal judicature and police established by Lord Cornwallis; the object, in this case, being to give security to the people by the suppression of crimes. With reference to this object, however, the scheme has notoriously failed. Since the year 1793, India has become a prey to disorders of every sort, and to the worst of crimes. The crime of robbery, accompanied with murder, rose to a most alarming height, and was prosecuted with a degree of union, perseverance, and cruelty, inconceivable to those who live in the civilized communities of Europe. Robbery is a regular profession, which is handed down from father to son; and the decoits, or gang-robbers, are formed, as the title implies, into powerful confederacies, and make their irruptions on the peaceful country with a force which it is vain to resist. They are described by Mr Hastings as "a race of outlaws, who live from father to son in a state of warfare against society, plundering and burning villages, and murdering the inhabitants." In the year 1772, the robbers are mentioned by the committee of circuit, and stated to be "not like robbers in England, individuals driven to such courses by sudden want; they are robbers by profession, and even by birth; they are formed into regular communities, and their families subsist by the spoils which they bring home to them."

---

[1] All the collectors invariably bear testimony to the oppressions of the zemindars after the passing of the regulation of 1799.

Increase of crimes.

All the reports of the judges employed in the administration of criminal justice concur in representing the deplorable prevalence of the atrocious crimes of gang-robbery and murder. Sir Henry Strachey, writing on this subject in 1802, observes, that the crime of decoity (that is, robbery by gangs) has increased greatly since the British administration of justice. Another judge, writing on the same subject in 1808, observes, "That decoity (gang-robbery) is very prevalent in Rajeshahye has been often stated. But if its vast extent were known; if the scenes of horror, the murders, the burnings, the excessive cruelties, which are continually perpetrated here, were properly represented to government, I am confident that some measures would be adopted to remedy the evil. Certainly there is not an individual belonging to the government who does not anxiously wish to save the people from robbery and massacre." (Mill, vol. iii. p. 311.) He afterwards adds, that such is the state of things which prevails all over Bengal; and as to his own particular district, he expresses his persuasion that no civilized country ever had so bad a police. To the same purpose Mr Dowdeswell, the secretary to the government in 1809, observes, in a report which he drew up on the general state of Bengal, "Were I to enumerate only a thousandth part of the atrocities of the decoits, and of the consequent sufferings of the people, and were I to soften that recital in every mode which language would permit, I should still despair of obtaining credit, solely on my own authority, for the accuracy of the narrative." "Robbery, rape, and even murder itself," continues he, "are not the worst figures in this horrid and disgusting picture. An expedient of common occurrence with the decoits, merely to induce a confession of property, supposed to be concealed, is to burn the proprietor with straw or torches, until he discloses the property, or perishes in the flames. And when they are actuated by a spirit of revenge against individuals, worse cruelties, if worse can be, are perpetrated by these remorseless criminals. If the information obtained is not extremely erroneous, the offender, hereafter noticed, himself committed fifteen murders in nineteen days; and volumes might be filled with the atrocities of the decoits, every line of which would make the blood run cold with horror." (*Fifth Report*, p. 603.)

It would far exceed our limits to trace in detail the cause of those evils which necessarily arose out of the very nature of the government now established. The truth is, the British were never qualified to act as legislators in India. They were too ignorant of the habits, manners, and character of the people, to meddle with their institutions, on which, however, they were continually innovating. By altering the old mode of settling the land revenues, they compromised the rights of the different classes of landholders and occupiers. Strife and contention immediately ensued, litigation burst upon society like a flood, the civil courts were overwhelmed with suits which they could not decide, and the people, desperate from a denial of justice, were involved in furious affrays with each other in prosecution of their rights, or, being driven from their lands, they had recourse to robbery for a subsistence. Business was thus, from various sources, accumulated in the criminal courts, which being encumbered with the delay, the expense, and all the tedious formalities of the English practice, proceeded with their decisions at much too slow a pace for the wants of the country; and the evil in this manner daily increased. The mischief of this delay was twofold: 1*st*, It allowed criminals, during the long interval between their apprehension and trial, to prepare the certain means of their escape, by the suborning of false witnesses, who, in the gross dissolution of morals in Hindustan, were always to be readily procured, and in any number; and, 2*dly*, It entailed a grievous hardship on the innocent, great numbers of whom were crowded into jails with the worst of felons, there to wait until the tardy hand of justice should bring them relief.

Defect police.

The inefficient state into which the police had fallen, was also one cause of the general prevalence of crimes. By the ancient institutions of the Mogul government, ample means were provided for the preservation of the public peace. In every village a permanent body of guards and watchmen was maintained, whose business it was to assist in all the subordinate details both of the revenue and police, to convey the rents of the ryot to the district collector, to watch those ryots who were in arrear, to guard their crops from depredation, to act as guides and protectors to travellers, to collect information of any offences committed, and to report the arrival in the villages of suspicious persons. For these various services they had grants of land rent-free, or on very easy terms. Besides this standing force of guards and village watchmen, the zemindar, who was at the head of the police, and was held responsible for all crimes committed within his boundaries, had under his orders a large body of *pykes*, or armed constables, whom he could call out in aid of the police service, either for the apprehension of offenders, or to prevent breaches of the peace. These establishments, though they had fallen into a state of decay at the time of the permanent settlement in 1793, and though they were frequently perverted from their original purposes, yet existed in all parts of the country, and the police force was found to be in great efficiency and strength. The zemindary of Burdwan, a tract of country seventy-three miles long by forty-five broad, which was in the highest state of cultivation, and well stocked with inhabitants, maintained a body of 2400 village watchmen, who were distributed under their respective chiefs amongst the different villages, for the double purpose of protecting the inhabitants and of procuring information; besides 19,000 *pykes*, or armed constables, who were liable to be called out, under the orders of the zemindar, in aid of the police. Instead of improving upon those ancient establishments which had taken root in the country, which were interwoven with the frame and texture of Indian society, and which were, generally speaking, efficient, though frequently perverted from their original purposes, Lord Cornwallis demolished the whole structure. According to his new scheme of police, the zemindary constables were disbanded, and their lands, which were allowed them in lieu of pay, were resumed, that is, were seized by government. The country was divided into districts of twenty miles square, over which a native police officer or darogah was placed, with fifteen or twenty armed men under his orders; he was assisted also by the village watchmen, and such of the zemindary constables as were still retained in the public service. It was soon found, however, that the new police officers could not effectually call out this array in aid of the civil power. They wanted the personal consideration of the zemindars, who had long been looked up to with respect and reverence as the hereditary aristocracy of the country. The system, therefore, proved eminently inefficient; nor were the officers employed under the new plan found to be less corrupt than the disbanded constables of the zemindars. The merits of the plan appear to be pretty fairly estimated in the Fifth Report (p. 71), in which it is observed, that the head police officers, and "the inferior officers acting under them, with as much inclination to do evil, have less ability to do good, than the zemindary servants employed before them." How vain was it to imagine that any better materials could be found for the regulation and government of the country than those which the country itself afforded. To complain of them was to complain of the general state of society out of which they were produced; and to throw them away because they were corrupt or otherwise imperfect, evinced an ignorance of the legislator's province, which is not to create materials, but to make the best use of those which are provided to his hand. Herein, then, consisted the error of the British legislators. They cast from them the only efficient instruments which were to be found for the government of the Indian community, while they had nothing to substitute in their place; and their plans, when tried in practice, were accordingly found to be idle theories, at variance with the whole frame and order of the society for whose use they were intended.

Pr lence of g- rob ry.

The pernicious consequences of thus rashly subverting the ancient establishments of the country were soon displayed in the alarming increase of crimes. The disbanded zemindary constables, whose lands were seized, were deprived of the means of living, and they necessarily betook themselves to theft and rapine for a subsistence. The country became infested with gangs of robbers and murderers, whose horrid cruelties struck terror into the peaceable inhabitants, whilst lesser crimes also became more frequent. The police was inadequate to the detection of offenders, the courts of justice to their conviction; and, amongst other evils, a host of false witnesses now arose, amid the general corruption of morals, who swore in the teeth of each other, perplexing all judicial proceedings, and confounding the innocent with the guilty. For remedy of these complicated evils, various expedients were resorted to. Amongst others, a feeble attempt was made to revive the ancient powers which the zemindars had over the police; but this was attended with so little success, that it was abandoned in 1810. In 1808 a superintendent of police was appointed, with a view, as was stated, of concentrating, in his office, all the information which might be obtained from different quarters, and of giving unity and vigour to the measures adopted for the apprehension of offenders; and, as a last resource, a regular establishment of police spies, called *goyendas*, was organized, and placed under a species of superintendents called *girdwars*, the office of the first being to point out the robbers, that of the latter to apprehend them. Notwithstanding all these measures, crimes of every description appear to have gone on increasing; and in a minute of Lord Minto, dated November 1810, it is observed, "That a monstrous and disorganized state of society existed under the eye of the supreme British authorities, and almost at the very seat of that government to which the country might justly look for safety and protection; that the mischief could not wait for a slow remedy; that the people were perishing almost in our sight; that every week's delay was a doom of slaughter and torture against the defenceless inhabitants of very populous countries." The directors, in whose letter of the 28th of October 1814 this passage appears, confirm the truth of the statement by the following brief observation: "That this representation of the late governor-general is not too highly coloured, would appear from the minute of Mr Lumsden, and the reports of Mr Secretary Dowdeswell, forming also part of the proceedings in regard to Mr Ernst."[1]

Spies.

The new scheme of employing spies, however useful in some cases, was in other respects highly detrimental to the peace of the community. Those spies, and more especially their superintendents (*girdwars*), became, in many cases, the pests of society. They took advantage of the power which they possessed of apprehending suspected persons, to extort money from them; and frequently, under threats of immediate apprehension, they laid under contribution all classes indiscriminately. It is stated, in a letter of the directors, dated October 1814, on the authority of Mr Dick, a circuit judge, that "whole villages are put under contribution, or subjected to the rapacity and spiteful machinations of the vilest members of society."[2] In some cases the innocent were brought to trial, and convicted, on suborned evidence, procured by these wretches.

Incapacity of European judges.

Amongst the other causes of these evils may be enumerated the incapacity of Europeans to officiate as judges in a society so peculiarly constituted as that of India. This is a fact which is deeply regretted by all the most experienced servants of the Company, from Sir John Shore downwards. Europeans are sent out to India with the sole view of amassing a fortune. They have no interest in the country from which they draw such important benefits; they know nothing of its habits and manners, never mixing with the natives in their ordinary business or amusements, and never attaining to more than a theoretical knowledge of their characters; yet they soon begin to officiate as judges, but how miserably ill appointed for such an office their own experience quickly teaches them. They soon find the difficulty of appreciating or understanding even the most ordinary transactions of a society, with the rules and principles of which they are entirely unacquainted. What is intelligible by intuition to a native, is a mystery to them; and it is easy to conceive how these difficulties must be accumulated on them in any case involving a long train of circumstantial or contradictory evidence. It is not, as every one knows, on the mere naked testimony of a witness, that a judge entirely relies; it is the tone, the manner, the living evidence of expression and character, which impresses upon testimony the stamp of truth, which carries conviction to the mind, and saves a judge from the miserable dilemma of being blown about by every wind of opposite evidence. These discriminations are, however, far too nice for a European judge in an Indian court, and he frequently knows not what to believe. He cannot, by any judicious cross-examination, extort the truth from contradictory witnesses. In any train of questions involving the peculiar usages of the country, his stock of knowledge is soon exhausted. A story which hangs together in all its main circumstances, may yet be inconsistent in some of its minute and delicate points. But a European can never detect inconsistencies which are wrapt up in the veil of local manners, and hence he lies at the mercy of every perjured witness who chooses to practise upon his ignorance. The truth of this statement is illustrated and confirmed by the concurring reports of many of those who have acted in this trying situation. Sir Henry Strachey, whose reports to the supreme government abound in most just, enlightened, and comprehensive views of Indian society and manners, observes, that "nothing is more common, even after a minute and laborious examination of evidence on both sides, than for the judge to be left in utter doubt respecting the points at issue. This proceeds chiefly from our very imperfect connection with the natives, and our scanty knowledge, after all our study, of their manners, customs, and languages. Within these few years, too, the natives have attained a sort of legal knowledge, as it is called; that is to say, a skill in the arts of collusion, intrigue, perjury, and subornation, which enables them to perplex and baffle us with infinite facility." "We perhaps judge too much by rule; we imagine things to be incredible because they have not before fallen within our experience. We make not sufficient allowance for the loose, vague, and inaccurate mode in which the natives tell a story; for their not comprehending us, and our not comprehending them. We hurry, terrify, and confound them with our eagerness and impatience." "We cannot," adds the same discriminating observer, "study the genius of the people in its own sphere of action. We know little of their domestic life, their knowledge, conversation, amusements, their trades and castes, or any of those national and individual characteristics which are essential to a complete knowledge of them. Every day affords us examples of something new and surprising; and we have no principle to guide us in the investigation of facts, except an extreme diffidence of our opinion, a consciousness of inability to judge of what is probable or improbable." "The evil I complain of is extensive, and, I fear, irreparable. The difficulty we experience in discerning truth and falsehood among the natives, may be ascribed, I think, chiefly to our want of connection and intercourse with them; to the peculiarity of their manners and habits, their excessive ignorance of our characters, and our almost equal ignorance of theirs." The following passage, from the same document, gives a striking view of the inefficiency of European judges: "The evidence on every trial convinces us, that innumerable robberies and murders, that atrocities of the worst conceivable kind, are committed, and that very often the perpetrators are before us; yet do we find ourselves, from causes of the nature above described, constrained to let them loose again to prey on society, or, at the utmost, to direct that they be discharged, on giving security for their good behaviour." "The judge of circuit is from day to day engaged in trying large gangs for robbery and murder, and letting them go; and the country continues to be overrun with them, to a degree truly deplorable."[1]

New measures.

The directors of the Company in Europe, as soon as they were informed of these vices and disorders in their Indian government, displayed the most praiseworthy zeal in their endeavours to remove them. Far from blaming the freedom with which they were exposed, or seeking, by palliations, to evade the truth, they listened to the representations of their servants; and, in many cases, followed their judicious and enlightened suggestions. One of their first cares was to re-establish the vigour and efficiency of the police. It was soon found that the system established in 1793, not being connected in any degree with the institutions or local manners of the country, was ill adapted to its end; and that the subversion of the ancient establishments, on the ruin of which it was founded, had been attended with the worst effects, and had paved the way for all the disorders and evils with which the country had been afflicted. Hence it has been the policy of the government to restore the ancient institutions of the country, and to revive for the public service the ancient array of village watchmen and zemindary constables, formerly disbanded. In many cases their efforts have been attended with success. A new energy has been infused into the police; and this, joined to the activity of the local magistrates, has had the effect of greatly diminishing the crime of gang-robbery, as well as other crimes. This fact is placed beyond a doubt by the records of criminal justice, from which it appears, that in Bengal the atrocities which formerly spread terror throughout the peaceful country, have been greatly diminished in number by the vigilance of the police and the great exertions of the local magistracy.

[1] Answers to Interrogatories of Government, 30th January 1802, *Fifth Report*.

In 1807, gang-robberies amounted to 1481
In 1824, to.................................234

Decrease...1247

In 1807, wilful murders amounted to...406
In 1824, to.................................30

Decrease...376

In Kishnagur, formerly notorious for gang-robberies, they decreased from 329 in 1808, to 10, their amount in 1824.

These records present a satisfactory view of the decrease of crime under the British rule in India; and it is ascribed, not to any improvement in the morals of the people, but to the great efforts of the magistracy, and to the increased efficiency of an improved police, in which the native officers are remarkably active.

Judicial establishments.

The judicial establishments of Bengal consist of,

1st, A high court of appeal, termed the Sudder Dewanny Adawlut; and the Nizamut Adawlut, or the chief civil and criminal court, which sits in Calcutta. A chief judge presides, with a salary of L.6000 a year, assisted by three puisne judges with L.5000 each. This court has power to revise the sentences of the inferior courts, and to mitigate them if excessively severe; to suspend provincial judges; and to receive appeals from the inferior courts. Its construction of the regulations or edicts issued by the governor-general is final.

2d, There are six provincial courts of appeal in Bengal, with a chief and puisne judge in each, for the trial of civil cases, in which the matter in dispute exceeds 10,000 rupees in value. They may try suits not exceeding 5000 rupees, if the plaintiff desire their decision. In the case of appeals their decision is final, except in special cases.

3d, There are twenty commissioners of circuit in Bengal, who combine revenue with judicial functions. They are criminal judges, who hold sessions of jail delivery at least twice in each year, who have also the direction and control of the magistrates, revenue officers, and police. They have each a salary of L.4000 a year.

4th, The city and zillah or district courts amount to forty-nine in Bengal. They have a judge, magistrate, and registrar, or, where the business is not extensive, a judge and magistrate, or a magistrate and registrar. These courts take cognizance of affrays, thefts, burglaries, &c., try original suits to the value of 20,000 rupees, decide appeals from registrars in cases not exceeding 500 rupees in value, and from sudder aumeems (native judges) and moonsifs. By a regulation of the governor in 1832, three zillah judges may be invested by the governor-general with power to hold sessions and jail delivery. From the zillah courts an appeal lies to the provincial courts; and, by a regulation in council, it was declared competent for the governor-general to establish in any part of the presidency a native court, to be superintended by a native judge; and also, by a regulation passed on the 11th of September 1821, he was empowered to authorize any judge of circuit to assemble native juries in criminal cases. Many distinguished persons in the service of the Company, and thoroughly acquainted with the Hindu character, have long recommended the employment of natives in the administration of civil and criminal justice. Native courts of justice have accordingly been constituted, and it would appear that they had satisfactorily executed their duties; for we find, in consequence of the heavy accumulation of suits in the zillah and city courts, a regulation of the governor-general, dated the 27th of December 1827, extending their powers to suits in which British subjects are engaged, to the amount of 1000 rupees, which were formerly excepted from their jurisdiction. In 1832 an extensive establishment of zillah and city courts was begun. A regulation passed in that year by the supreme council of Bengal ordains, that such of the natives, of whatever caste or religion, as are found qualified, by their attainments and good character, are to be employed in the zillah (district) and city courts, as civil and criminal judges, with liberal salaries, and, more recently, as assessors on the bench, along with European judges.

A similar plan of judicature is in force at Madras and Bombay. At Madras Colonel Munro, when he was governor, was extremely anxious for the introduction of the trial by punctayet, or native juries; and a regulation, dated the 31st of August 1827, was issued for allowing native juries to be assembled in criminal cases.[1] The office of a native judge was also constituted for the trial of criminal cases, by a regulation issued the 31st of August 1827. By the governor and council of Bombay a regulation was issued in 1830, extending the jurisdictions of native courts to all original suits, of whatever amount.

At each presidency there is a supreme or king's court, with a chief judge and two puisne judges, a master in equity, registrar, an established number of attorneys and barristers, at the discretion of the judges; and at Calcutta a Hindu and Mahommedan law officer is attached to the court. The jurisdiction of this court extends over the presidency, with certain exceptions not well defined; and in certain cases a jurisdiction is claimed beyond the presidency, though it has been doubted whether such claims rest on any sure foundation of law. There are at Calcutta and Bombay courts of requests for the recovery of small debts, the recorders of which are Europeans.

Tenures.

The zemindary settlement was extended to Benares in 1795. It was introduced into the ceded territories of Oude in 1801 and 1803. The country was divided into seven districts, with a judge and magistrate and collector in each; and a court of appeal and circuit, with a suitable establishment of officers, fixed at the town of Bareilly. The lands were let at first for three years on increasing annual rents, by which the tax was raised from its amount in 1801, of 13,523,474 sicca rupees (L.1,600,000), to 19,161,486 rupees, being an increase on the existing tax of more than 40 per cent. and a foretaste to the oppressed peasantry of the blessings they were to derive from British rule. In 1805 it was proposed to extend the permanent zemindary settlement to the provinces acquired from Scindia and the rajah of Berar, being the Doab, and a tract on the right bank of the Jumna, the province of Cuttack, and of Bundelcund on the right bank of the Jumna above Allahabad. Objections, however, having been made to this measure, the lands have been let since 1810 to the zemindars, on leases of five years; and the assessments have as usual been enormously increased, from 19,426,787 rupees (L.2,266,457), the amount in 1807, to 31,427,494 (L.3,666,540) in 1818–1819. But here, as in all other cases, the revenue has been improved at the expense of the country; and accordingly we find Lord Moira regretting the sale of lands in these provinces for outstanding balances, and the evasion of the copartnery rights by which these estates were held, at "the expense," he adds, "of the well-being and peace of the district, which it invariably disturbs."[2]

---

[1] It is remarkable that these enlightened regulations of Colonel Munro, for improving the condition of the natives, were disapproved of by two out of the three judges of the Sudder Dewanny Adawlut, and by ten out of the twelve judges of the courts of circuit; by several of the other members of the council at Madras, namely, Sir G. T. Walker, who alleged, and with some appearance of reason, the corrupt morals of the natives. This was, however, a difficulty to be overcome.

[2] Rickards' *India*, vol. i. p. 399.

The ancient territories attached to the presidency of Madras contained two descriptions of land-tenures, namely, the lands occupied by the zemindars or polygars, and the Havelly lands under the immediate management of the government. In letting these lands, it was the practice either to receive from each cultivator his tax in kind, in which case it was necessary to maintain a large establishment of revenue officers, or to let the lands to a revenue farmer, on whom extensive powers were necessarily conferred, and consequently ample means of oppression. Another mode of settlement was with the head inhabitants of the villages, who contracted for the public tax, which they collected from the ryots. The ancient possessions attached to the presidency of Madras were, the Jaghire, which had been desolated by the invasion of Hyder Ali in 1780, and the Northern Circars. The revenues of the Jaghire had been collected by village settlements from 1789 to 1802–3, when it was divided into sixty-one estates of from 2000 to 5000 pagodas of annual rent, and sold to the highest bidder. The permanent settlement was introduced into the Northern Circars in 1802 and 1803. The assessment in some of the zemindaries exceeded a lac, or 100,000 pagodas, though it did not include the sayer duties, which consisted of imposts on houses, implements of agriculture or trade, on merchants, artificers, &c. This assessment was not framed on any accurate knowledge of the resources of the country, but any error that was made was on the side of excess. It was the poor peasantry who suffered for the ignorance of the collectors, who were determined not to underrate the lands.

Quidquid delirant reges, plectuntur Achivi.

The Jaghire, in 1784, had not recovered from the devastation of Hyder's invasion; it still remained a monument of the miseries of war; and to all these calamities was now superadded, Mr Rickards justly observes, " a revenue administration, the basis of which was the exaction of a land-tax from the wretched remaining inhabitants, equal to one half the gross produce of the soil."

The modern possessions of the Madras presidency are by far the most extensive, and comprise the Carnatic and Mysore; the whole peninsula of India, in short, south of the Toombudra and Kistnah rivers. Most of these lands, except such as are held by the polygars or zemindars of Southern India, had been farmed out in extensive tracts by the native rulers to individuals, by whom they were subset to the head men of the villages, who collected the tax from the cultivators. This mode of farming the revenues was after some time given up for the village or *mouzawar* settlement, according to which the intermediate agency of the renter or farmer was superseded by that of the government collector, who contracted for the whole assessment with the head man of the village. This plan of village settlements was again abandoned for the *ryotwar* or the *kulwar* settlement, which only differed from the village settlement in this, that it substituted the government collector for the head man of the village, and thus abolished all intermediate agency between him and the ryot. In the village settlement, the great farmer or revenue speculator was superseded in his agency by the potail or head man of the village; in the ryotwar settlement, the potail or head man of the village was superseded by the government collector, who undertook the duty of settling individually with each ryot for his rent. With this view an exact scrutiny was instituted into the whole produce of the country. Every field was surveyed, measured, and re-measured; its name was entered in the register, and where it had no name it received one; red land was to be distinguished from black land; trees, rivers, wells, forts, open villages, were to be all specified; the inhabitants to be enumerated; their cattle, buffaloes, sheep, goats, &c., in short, every thing taxable, was to be brought to account in the ryotwar survey.[1] The assessors followed in the train of the surveyors, and a host of revenue officers was spread over the harassed country. The object of this severe scrutiny into the produce of the land, was to ascertain the highest assessment which it could possibly bear. It was not to lighten the burdens of the poor ryot that his means were so rigidly inquired into, but to find out how much he could pay without being utterly ruined. " The survey valuation," it is observed in the Fifth Report of the Select Committee (p. 120), "regulated on the principles which have been described, rather constituted the *maximum* of assessment, than the absolute demand upon the cultivator for that assessment."[2] This *maximum* of assessment is what is also called the *standard rent*, or jumma. " Alterations in the assessment," says the Report, " were also occasioned by the gradual increase made to it, as the circumstances of the cultivators and the state of agriculture improved, in order to raise it to what was considered the *standard rent*." Thus it was obviously a scheme for racking the country. From the survey a maximum or standard assessment was calculated, that is, the highest assessment which the country could possibly bear; and this, though not immediately taken from the ryot, was the standard to which it was understood that his assessment would be ultimately raised as his circumstances improved. It was the reward that awaited his successful cultivation of the land; and in this case he had little encouragement to sow, when another was to reap. " Under this mode of adjusting the rents of a village," it is said in the Fifth Report, " the ryot knew before he set his oxen to the plough, and dropped his seed into the ground, what was the utmost limit of rent that he could be called upon to pay; and that the advantage of additional labour upon his field would be all his own, as well as the advantage of additional produce in an abundant season. He also knew that in an unfavourable season an abatement would be made in his favour if his diminished means rendered him unable to satisfy it. He further knew, that if the potail required him to pay more than the sum at which his rent was finally fixed by the collector, he had only to prefer his complaint." (P. 121.) When the standard rent, as it is called, was greater than the ryot could pay, being calculated not on the produce, but on the producing capacity of the soil, of what advantage was it to him that it could not be raised higher? He did not, as is here stated, know either that the advantage of additional labour upon his field, or that the additional produce in an abundant season, would be all his own, as the assessment was raised with his improving circumstances; and the extra produce of an abundant year was taken to compensate the remissions of a bad year.[1] Besides, as the harvest advanced, the revenue officers again spread over his fields to gauge the produce and to fix the annual rent. When the crop failed to a great amount, the deficiencies of one village were re-assessed on the neighbouring villages; so that the ryot was far from "knowing, before he set his oxen to the plough, and dropped his seed into the ground," the utmost limit of rent he had to pay; and with regard to any complaints against the potail, the directors observe, "it is vain to say that the ryots are protected against harassing and vexatious proceedings by courts of justice; for the loss of time and the expense incident to a legal process, and the delay in decision, will in nine cases out of ten prevent the ryot from appealing to the court."[2] The revenue board at Madras observe on the ryotwar settlement, "the system then was, to *make as high a settlement as it was practicable to realize;* if the crop was good, the demand was raised as high within the survey rate as the means of the ryot would admit; if the crop was bad, the last farthing was notwithstanding demanded, and no remission was allowed, unless the ryot was totally unable to pay the rent. On this point the most severe scrutiny was instituted; for not only was the whole of the collector's detailed establishment of servants employed in an investigation of his means, *but his neighbours were converted into inquisitors, by being themselves made liable for his failure,* unless they could show that he was possessed of property."

---

[1] See Instructions to Surveyors, by Colonel Munro, the great patron of the ryotwar settlement, *Fifth Report*, Appendix, p. 787.

[2] William Chaplin, Esq. who was employed as registrar under Sir T. Munro in the Ceded Districts, after mentioning that a survey, classification, and assessment was undertaken by Sir T. Munro in the year 1801, and completed in 1806–7, gives the following conclusive evidence respecting the nature of the assessment:—" Was the assessment fixed the highest assessment which it was thought fit in any case to exact for the land? Yes. It was a maximum assessment, which was never expected to be wholly raised; it was a maximum assessment, beyond which no collection was ever to be made afterwards; it was an assessment, the total of which was avowedly too high at the time to be realized, without occasional and partial remissions; and it was recommended afterwards to be reduced. Was any abatement made? No abatement was at that time made. A discretionary abatement was every year made by the collector, whenever there was a partial failure of the crops, from drought, or from the poverty of the inhabitants. Still the sum demanded was the maximum assessment? The sum demanded was the maximum." (See Minutes of Evidence before the Lords' Committee, 30th March 1830, p. 176.)

It is thus obvious that the much boasted ryotwar settlement is, like all the other continually changing plans introduced by the East India Company's servants, an elaborate scheme of extortion, founded on the idea of the proprietary right of the sovereign to all the lands within his dominions. But, besides the land-tax, amounting to forty-five or fifty per cent. on the gross produce of the soil, there are other taxes, called *sayer*, *moturpha*, or *weesabundy*, being taxes on the profits of merchants, traders, manufacturers, craftsmen, taxes on houses, shops, looms, tolls, mechanical and agricultural implements, all which are embraced in the collector's survey, and appear to have been rigidly exacted. "The mode of settling the moturpha on looms," says one of the collectors, "has hitherto been very minute; every circumstance of the weaver's family is considered; the number of days which he devotes to the loom, the number of his children, the assistance which he receives from them, and the number and quality of the pieces which he can turn out in a month or year; so that let him exert himself as he will, his industry will always be taxed to the highest possible degree." Colonel Munro has described the tax on house-rent, or, as he calls it more properly, a tax upon income, to be levied in a manner the most arbitrary, and which offends against every principle of taxation. It extends to the poorest class of labourers, who pay one or two rupees, though their hut is not worth more than from five to ten rupees. This tax Colonel Munro points out as a source of increasing revenue; and when he found it higher in one district of the ceded provinces than another, he equalized the tax, not by lowering, but by raising it everywhere to the same level, and even suggested that it might be increased "as the circumstances of the country improve;"[3] so that it would appear as if there were no end to the demands of the state, thus prowling into the recesses of domestic industry, and casting as it were its evil eye on every species of increasing wealth. This rigid scrutiny, not so much into the actual resources, as into the productive capacity of the soil, was with a view to a permanent settlement of the land-tax; and this permanent settlement was prospective, as the tax was to keep pace with the improvement of the country.

The ryotwar settlement was substituted for the village settlement in the southern parts of the peninsula, in Salem and Kistnaghery, amongst the Carnatic polygars or military chieftains of the country, and in Ramnaud and Dindigul; and in 1802 and 1804 the permanent settlement with the zemindars or polygars was introduced, the land being divided into estates, and sold to individuals under the burden of the standard rent, to which the actual rent had not yet risen. The country had previously been the scene of great confusion, from the rebellion of the polygars; the land-rent had risen 117 per cent., from 168,305 to 344, 682 pagodas; and the *standard* rent, now fixed, was, as usual, higher than the country could bear. The estates of the landholders were accordingly brought to sale for arrears of rent, and the lands which had been purchased were mostly resumed by the government. The province of Dindigul is in particular described by Sir Thomas Munro himself, as being in 1821 in a state of deplorable disorder and oppression from high taxes. A keen but very useless controversy has been maintained amongst the Company's servants regarding the respective merits of the zemindary, the village, or ryotwar settlements. But it is not the mode of levying the tax, but the amount, which is the grievance, and the standing source of misery all over India. The permanent settlement having been discontinued in 1804 by order of the directors, was not extended to the other territories under the presidency of Madras.

In the country known under the name of the Ceded Districts, being ceded to the Company by the nizam in 1792, extending south-east from the Toombudra river as far as the Eastern Ghauts, equal in extent to Scotland, and containing about two millions of inhabitants, the ryotwar settlement was introduced by Colonel Munro in 1800, and continued till 1807–8. During this period the land revenues were raised from 1,006,593 pagodas (L.402,637), to 1,517,272 (L.606,909); and in 1808–9 they amounted to 1,802,570 (L.721,038), of which the sum of 1,669,908 pagodas (L.667,963) consisted of land revenue. The ryotwar was superseded by the village settlement, which comprised three years from 1809, after which, in 1811–12, commenced a decennial settlement of the Ceded Districts. The country was oppressed by this heavy assessment; and under the village settlement the head men of the villages (potails) declined to contract for the rent. Speculating renters were accordingly introduced, whose severe exactions increased the general distress, and numbers of the ryots emigrated to Mysore. In 1817 it was determined again to try the annual ryotwar settlements, when the decennial village settlements would expire in 1820–21; and Sir Thomas Munro, now governor of Madras, prepared to carry into effect the views of the directors. Many humane and excellent regulations were passed to prevent the oppression of the ryots; and the benevolent intentions of the court of directors may be traced in their various despatches on the subject. But still the only mode of relieving the country was to lessen the amount of the tax, and without this, no regulations, however wise, will ensure the prosperity of the subject.

---

[1] Colonel Munro himself states this to be the rule of settling. "Were it even possible," he observes, "to estimate exactly the actual loss in every year, it would not follow that it ought to be remitted; for the same cultivators who have lost this year may have gained the last; and as no extra assessment was laid upon their profit, no remission can now fairly be claimed for their loss. Whatever may have been the crop, *should it have even been less than the seed*, they should always be made to pay the full rent, if they can, because good and bad seasons being supposed to be equal in the long run, the loss is merely temporary, and the making of it good is only applying to the deficiency of a year of scarcity, the funds which have arisen from one of abundance." (See Extracts of Proceedings of the Board of Revenue at Fort St George, 19th May 1803, *Fifth Report*, p. 748, 749.)

[2] Rickards' *India*, vol. i. p. 482.

[3] See *Fifth Report*, Appendix, p. 942, Extract from the Report of the Principal Collector of the Ceded Districts, 15th August 1807.

In the southern division of Arcot the ryotwar system was introduced in 1805–6, by Mr Ravenshaw, who gives a melancholy picture of the state of the country. "The miserable appearance of the villages," he observes, "a great portion of the inhabited houses of which are without roofs; and of the inhabitants, a great number of whom are clothed in the garb of extreme misery; must touch the heart of one who has any spark of sensibility for his fellow creatures." From this state of extreme depression the country gradually revived, and the revenue improved under the judicious management and moderate assessment, of which the collector was a strenuous advocate.

On the western coast of India, the provinces of Malabar, Canara, Coimbetore, &c. were subjected to the rigorous survey of the ryotwar settlement. In Malabar, the collectors under the Bombay government, on the notion of the sovereign's proprietary right to the lands, claimed fifty per cent. on the gross produce, which it was impossible to realise, though the clearest rights of property were trampled under foot, and the prejudices of the country deeply wounded, by the sale of lands, the consequence of over assessment, and by the ruin of the ancient aristocracy.[1] A rebellion was the consequence, which was rigorously and with all due severity put down, and the province transferred to the Madras government, whose collector, we are told, in 1801–2, effected a sudden rise of about fifty per cent. in the land revenue, by adopting rates of assessment inconsistent with long-established local usage, and from which it was soon after found expedient to recede.[2] The lands were over-assessed; in many cases, after they were sold, the proprietors were thrown into prison, and there kept for years, by the severity of the collector.[3] A ryotwar survey of the province was undertaken by the principal collector, who, being obliged to leave the province, its revenues were successfully administered by the new collector Mr Warden, by whose judicious advice a fresh survey was averted for a time, as inconsistent with the customs of the country, and the existing state of property. In 1833, against the earnest remonstrances of the inhabitants, a strict ryotwar survey was begun, of the most inquisitorial nature, not only into the produce of land, but into the profits and all the implements of trade and manufactures. The absurdity and injustice of this assessment, and the hardship which the people suffered from the monopolies on timber, tobacco, salt, &c. appear, from the evidence given in 1830 before the Lords' Committee on the affairs of India, to have been very great. By the timber monopoly, which was the source of great complaints, the price was raised so as to stop ship-building. In many parts the timber on an estate constituted its chief value; and the government monopoly therefore amounted to an extinction of the rights of property, and was the cause of unspeakable discontent and distress. A conservator of the public forests was appointed; and as the distinction between public and private property was often doubtful, the proprietors and occupiers of land were prevented from cutting down wood even for the most necessary purposes, under pretence that it belonged to the Company, though by his orders all the wood on their estates might and often was cut down.[4] This monopoly was abolished in 1823 by the advice of Sir Thomas Munro, who, though he administered a bad system, acted on this as on other occasions with the most enlightened humanity. The monopoly of salt was equally grievous to the inhabitants, and occasioned dreadful complaints. The landholders depended in many cases on the manufacture of salt for paying the rents of their lands. They were accordingly ruined by the suppression of the salt pans in Malabar, the compensation given them being very inadequate; and it was besides estimated that 6438 persons were thrown out of employment.[5] Tobacco, almost a necessary of life in the moist climate of Malabar, where the fall of rain is 140 inches, three times more than in the adjoining province of Coimbetore, or on any part of the Coromandel coast, was raised 800 per cent. by the monopoly. One of the collectors, Mr Baber, made strong representations against these enormous abuses, by the continuance of which he was afraid that the people would be driven into rebellion. Tobacco was in consequence smuggled into the country from Coimbetore by gangs of contraband traders, of bad character, and ripe for any villany.[1] The revenue was raised from 217,619 pagodas, its amount in 1800–1, to 638,488.

The province of Canara was committed to the management of Colonel Munro, who, by his vigilant administration, restored tranquillity in the country. Yet Colonel Munro, with all his great qualities, was a strict assessor; and the rent imposed upon this district must have been high, as, though he mentions that he disapproved of the numerous additions made to the ancient land-rent by Hyder and Tippoo, and says, "had such an assessment as that introduced by Hyder and Tippoo existed in ancient times, Canara would long ago have been converted into a desert," yet he adds, "I did not think myself at liberty to depart widely from the system which I found established, as it is the same as that which exists in all the provinces which the Company have acquired in the last and former wars. I have made no other reduction in the assessment of Tippoo Sultan than such as was absolutely necessary in order to ensure the collection of the rest. I considered myself merely as a collector, who was to investigate and report upon the state of the country, but who was to leave it to the board to decide as to the expediency of lowering the assessment."[2] The zemindary settlement has never been extended to any portion of the territories under the Bombay presidency, nor to the districts ceded on the Nerbuddah and by the rajah of Berar in 1826; the greater part of these territories being all assessed by villages.

---

[1] See Lords' Committee, Evidence of T. H. Baber, Esq. Have there been any sales of land for arrears of revenue? Very considerable. So much so, that almost an entire revolution has taken place in property within the last thirty years. When a tenant of a small estate failed to pay, did the collector immediately sell that portion of his estate? No. In the first instance his person was liable, then his moveable property; every article of every description, every thing which could be laid hold of, was seized and sold; and that failing, then the land; even slaves have been sold, the same as cattle. 31st March 1830.

[2] *Fifth Report*, Appendix, p. 798, Extract from the General Report of Revenue at Fort St George, 5th October 1808, on Malabar revenues.

[3] See Evidence of T. H. Baber, p. 206.

[4] The cruelty of this monopoly, and the misery and vexation which it occasioned to the inhabitants, are forcibly described by Sir Thomas Munro in a minute which he drew up on the subject. After pointing out the situation of the ryot when he had the complete control over his wood of every kind, he observes, "But what is his situation now? He cannot cut down or sell a bit of wood on his own property, for the most ordinary purposes; he cannot even remove the young teak plants which spring up from seeds scattered by the winds, though they are injurious. Though he cannot himself cut down his own trees, the conservator cuts them down at pleasure, both on his hills and in his fields and gardens, and makes him pay duty on the wood; and he not only levies duties, but he confiscates property. A monopoly, or even any restriction, on the cutting of wood, is, in Malabar, vexatious and oppressive in the highest degree. Wood is wanted in large quantities for every purpose, for boats, houses, barns, and granaries. In a country where the fall of rain during the five monsoon months is from a hundred to a hundred and sixty inches, and sometimes nearly fifty inches in one month, it is almost impossible to make any building water-proof. The houses of all the more substantial rayets (cultivators) have a double roof, or two stories: in the lower the family resides; the upper serves as a lumber-room, but its chief use is to defend the lower, and carry off the water. The barns and granaries are necessarily constructed in a still more substantial manner, because a great part of the grain is reaped in the rainy season, during short intervals of sunshine, and, in order to be dried instantly, carried into the barns, which are made large for that purpose. The principal public buildings were formerly covered with copper, as the only means of completely excluding the water. The copper was stripped off and coined into money by Tippoo Sultan; but we go beyond him; he only deprived them of copper, but we of their roofs, or, what is the same thing, we prevent them, by our restrictions, from replacing them. These harsh measures have had their natural result; clamour and confirmed aversion and discontent, if not open resistance."

[5] See Evidence before Committee of Lords, by T. H. Baber, Esq. p. 214, April 1830. Commissioner Græme, in his letter to the board of revenue, 31st August 1830, mentions other frauds connected with the salt monopoly. He says that the government, on purchasing salt, are in the habit of pressing it down with hands and feet in the wooden measure; but when they sold it, of filling it up as light as could be, which made a difference of 20 per cent.; and other differences of measurement made an additional 20 per cent. See also Rickards, himself a principal collector in the province at the time, vol. i. sect. xvi. p. 542, et seqq.

Re nue an axa- ti

The other sources of the East India Company's revenue are the monopolies of salt and opium, custom duties both by sea and land, though the latter, from the obstructions which they occasion to trade, are in the way of being abolished; a stamp duty on conveyances, contracts, leases, policies of insurance, and deeds of every description; also on judicial proceedings. The mint, in which a seigniorage of two per cent. is charged on the coinage, and the post-office, yield an inconsiderable revenue. Of these various modes of taxation, the monopolies of salt and opium are the most objectionable. The opium monopoly was formerly a source of fraud and oppression, the cultivator being compelled to raise this article on pain of losing his land, and, in the event of a deficient produce, though occasioned by adverse seasons, being liable to punishment unless he made up the quantity, which he could only do by buying at a higher price than he expected to receive. Other frauds were practised by the collector or his agents, such as making pecuniary advances to the ryots in a light currency, and in using light weights in the weighing of the produce.[3] These frauds were inquired into and checked by the humanity of Lord Cornwallis in 1788. Treaties, as has been already mentioned, were entered into with the native princes for extending the opium monopoly to their territories. But these treaties, at the request of the princes, to whose subjects they were a continual source of vexation, were relinquished; and the trade in opium being now free, except in the Company's territories, the monopoly can scarcely be so profitable, owing to the reduction of price in the China market, from the competition of opium from Malwah and other provinces. The profits of the opium monopoly amounted in 1828–29 to L.1,930,891.

The monopoly of salt, which is so necessary to give a relish to the insipid food of the poor Hindu, is a still more pernicious device for raising money, and was formerly the source of great oppression; the molungees or salt-workers in Bengal being one half of them (the Adjura molungees) held under a species of bondage, and compelled to work at half the rate of wages received by the Ticka molungees, who worked by free compact.[4] This injustice was also inquired into and redressed by Marquis Cornwallis. Still the restraint under which such a monopoly lays the industry of the country, and the high price to which it raises a necessary of life, is a serious oppression, more especially as a revenue of equal amount might to a certainty be raised by a tax on the article with a free trade. The following table contains the latest account of Indian taxation:—

Direct Taxation.

Land-revenue	L.12,895,366
Farms, licenses, and tax on professions,	152,780
Sayer and Abkaree	861,196
Territories on Nerbuddah	457,923
Burmese cessions	117,326
Mysore and other subsidies	392,355
Ava, Bhurtpore, &c.	491,249
Marine receipts	77,787
	L.15,445,982

Indirect Taxation.

Salt sale, and licenses	L.2,700,147
Customs (sea and land)	1,869,634
Opium	1,930,891
Post-office	135,617
Tobacco	85,128
Mint receipts	19,414
Stamps	368,431
Judicial	126,464
	L.7,235,726

Mercantile character of the East India Company.

It will now be proper briefly to revert to the mercantile character of the East India Company; to give some account of its cash transactions and its commercial privileges, together with the general result, as it appears in the present state of its affairs.

The capital stock of the Company was originally L.2,000,000, and by successive enactments was increased as follows:

In 1708	L.2,000,000
1786	800,000
1789	1,000,000
1794	1,000,000
	L.6,000,000

Part of this capital was subscribed at a rate greatly exceeding the nominal amount. In 1794 there was paid for one million of stock the sum of L.2,027,295; and the whole amount paid into the Company's treasury for capital stock amounts to L.7,780,000.

As long as the attention of the Company was confined merely to trade, the annual dividend, which, from the year 1708 to 1766, varied from five to ten per cent. may be taken as a tolerably fair criterion of the profit gained. The acquisition in 1765 of the sovereignty and revenues of Bengal gave rise amongst the proprietors to the most extravagant anticipations of wealth, and, on the faith of these, the dividend, as already mentioned, was raised to ten, and afterwards to twelve per cent. But these expectations proved fallacious, and it was, in 1773, lowered to six per cent. It was afterwards raised to eight, and in 1793 to ten and a half per cent. Ever since the acquisition of the sovereignty of Bengal, it was not so much from *trade* as from *revenue* that the Company's profits were expected to arise. It was by the remittance of a large sur-

plus revenue from India that the proprietors hoped to be enriched. These hopes, however, have not been fulfilled. A large and increasing revenue has indeed been collected, but it has been invariably followed by an increase of charge and of debt. The constant increase of the charge is a standing subject of complaint in the correspondence of the directors with their servants in India, whom they frequently accuse of the grossest profusion and corruption, reproaching them with the enormous expense of their establishment, and urging them, in the most earnest manner, to retrenchment and economy; whilst the servants, on the other hand, always hold out the fairest promises of their future management, and flattering statements of revenue, to be regularly overturned by the increasing charges of the succeeding year.

When Lord Clive was sent out to India in 1765, it was for the purpose of securing the Company's revenue from the profusion and mismanagement of corrupt servants, against whom the clamour in this country was loud and general. No amendment, however, took place, and the directors continued their complaints. During the ten years administration of Mr Hastings, which commenced in 1772 and ended in 1783, the Company were deeply involved in the wars and politics of India, the effect of which, on the finances, appears to have been to increase both the revenue and the charge, and in the same proportion to accumulate debt. In 1772 the revenues of Bengal, Bahar, and Orissa amounted to L.2,373,650, and the charges to L.1,705,279; producing a surplus of L.668,371. The India debt amounted to L.1,850,166. In 1785 the revenues of Bengal, Bahar, and Orissa, including the new revenue of Benares, amounted to L.5,315,197, and the charges to L.4,312,519; thus producing a surplus of L.1,002,678; to counterbalance which, however, the debt in India was increased to L.10,464,955. With the management of their affairs in India the directors seem never to have been satisfied; for we find them about this period complaining that certain late revenue regulations were made, "rather with a view of creating lucrative posts for a certain description of men, than with any design either of increasing the revenue or of promoting commerce." In the same strain we find them complaining, in a letter to Lord Cornwallis, of a disposition in their servants to "innovation and experiment, without urgent necessity or apparent cause, new institutions, and almost instant deviations from them, multiplication of offices, and increase of salaries." These, they continue, "are always introduced with flattering schemes of increase to the revenue and diminution of expense, which has hardly, in any instance, been realized by the event." In consequence of this constant increase of expense, though the Company's revenues were increased, the surplus revenue was diminished. In the same letter the directors state that it was one million less than in the year 1766, when the Bengal revenues were acquired.

In 1793 the revenues amounted to L.8,225,628, and the expense to L.7,007,050, thus yielding a surplus of L.1,218,578; and the debt was reduced to L.7,971,665. This state of the Company's affairs became the subject of the most extravagant declamations both in parliament and elsewhere. The old delusion of Indian wealth, nearly as absurd as the South Sea bubble, was successfully revived; annual remittances of treasure were anxiously expected and confidently promised; and the expected surplus was most gravely appropriated by acts of parliament to its appointed ends. Mr Dundas was the principal actor in this solemn farce, in which, being probably credulous himself, he imposed on the credulity of others, boasting that India would be a vast source of wealth to the Company, and to the nation. But these predictions were soon falsified by the event. The surplus of Indian revenue, for the appropriation of which so many wise provisions were passed, soon vanished, and in 1797 a deficiency appeared, which continued till 1810. The revenues had, in the mean time, increased from L.8,225,628, their amount in 1797, to about 15½ millions sterling; but, instead of any surplus being remitted from India to Europe, there appears a balance against India, from 1797 to 1807, to the amount of L.1,629,701; whilst, during this period, there was sent from England to India, more than was received, a sum of L.5,691,689. This was the sum, therefore, which England lost during those ten years by its connection with India. From another account also, it appears that, from 1793 to 1816, England remitted of cash to India L.8,824,067 more than was received. (See *East India Annual Accounts laid before Parliament*, p. 19.) In 1811 the revenues began again to exceed the charges, and in the three following years there was a large surplus of nearly three millions sterling in each year. In 1816, 1817, and 1818, this surplus continued to be above two millions annually; and it is stated by Mr Prinsep, in his narrative of the last Indian war, that there was actually accumulated in the different treasuries of the Company, bullion to the amount of eight millions sterling. Here, then, was an opportunity of making a large remittance to the directors in Europe. But of this large accumulation of treasure they received not one shilling. The Indian government was involved in a series of new wars, in the carrying on of which not only was all this wealth expended, but an additional sum of about four and a half millions sterling was borrowed; so that the Indian debt, which in 1814 amounted to about twenty-nine millions sterling, was raised to nearly L.34,775,792, its amount in April 1818. Mr Prinsep, however, in his interesting account of the administration of Marquis Hastings, still confidently held out the hope of a surplus revenue; and he founded his expectations, 1*st*, on a reduction of expense in consequence of the peace recently concluded; and, 2*dly*, on a great increase of revenue from the late extension of the Company's territories. But so far from any surplus of revenue being realized, we find the whole produce of the taxes collected throughout the extensive dominions of the Company, amounting to L.22,019,310, regularly swallowed up in the increasing charge; so that, on the seventeen years ending 1830–1831, the annual deficit amounts to L.18,994,036, as will appear from the following table:—

1832[2]										

---

[1] Deficit of L.852,217.

[2] The year embracing 1832–33 not made up.

The commercial monopoly of the East India Company was granted by William III. in the year 1698, and it was confirmed by 9 and 10 William III. c. 44. The legislative enactments regarding the territorial possessions of the Company commenced in 1767. In that year it was agreed that, in consideration of an annual payment of L.400,000, the territorial possessions should remain in possession of the Company for two years, and afterwards for five years from the 1st of February 1769. There was paid to the public, under these two acts, from 1768 to 1775, the sum of L.2,169,398. In 1773 the affairs of the Company were much embarrassed, and they presented a petition to parliament soliciting a loan for four years, and a sum of L.1,400,000 was accordingly lent; and at this time parliament first assumed the regulation of the Company's affairs. The dividend was restricted to six per cent. till this loan should be repaid, and afterwards to seven per cent. It was enacted that the directors should be elected for four years, six of them, being a fourth part, to vacate their office annually by rotation; the qualification to vote in the court of proprietors to be raised from L.500 to L.1000. A new court of judicature was at the same time established at Calcutta, consisting of a chief justice and three principal judges, appointed by the crown; and a superiority was given to Bengal over the other presidencies; an appropriation was made of the revenues and profits of the Company, and they were required to make half yearly statements of their debts, and of the profit and loss incurred on their trade and revenues. The loan of L.1,400,000 having been discharged, two other acts were passed, by which the territory was continued to the Company for one year. In 1781 an act was passed continuing the territorial revenues and privileges of the Company till the 1st of March 1791, and then to be taken away only on a three years' notice; providing also that the Company should pay annually L.400,000 to the public, besides three fourths of any surplus revenue that might accrue.[1] Under this act the Company paid to the public L.400,000 in satisfaction of all claims up to the 1st March 1781. But of the annual sum of L.400,000 which was afterwards to be paid, the public received only L.300,000; and in 1783 the Company were allowed to borrow L.800,000, and out of this borrowed money to pay a dividend of eight per cent. By the act of 33 Geo. III. c. 52, passed in 1793, the British territories in India, together with the exclusive trade, were continued to the Company for twenty years; and the Company agreed to pay L.500,000 annually, unless prevented by war expenditure. But only two payments were made, of L.250,000 each, under this act, in 1793 and 1794. In 1814 the charter of the Company was renewed for twenty years; the trade to India opened under certain limitations, with the exception of the trade to China, the monopoly of which, with all the territorial revenues, was continued till 20th of April 1834. In 1833 a new act was brought forward by Mr Grant, for the future administration of the vast dominions of the Company, and for the general regulation of their affairs. By this act the commercial privileges of the East India Company were abolished, and the trade to India and to China was thrown open to all British subjects. The government of India was still vested in the directors of the company, in conjunction with the board of control, according to the provisions of Mr Pitt's bill. It was declared lawful for all British subjects to settle in any part of the East India Company's dominions throughout India without any license, merely making known to the chief officer of the customs their names, places of destination, and their business; to hold lands for a term of sixty years, and in perpetuity by a grant from the governor-general; and all classes in Hindustan, of whatever religion, colour, caste, or country, are declared equally eligible to all public offices. The value of the Company's stock is guaranteed to the proprietors at the rate of L.100 for every L.5. 5s. of annual dividend. For this purpose a fund of two millions is set apart, to accumulate at compound interest, until it amount to twelve millions, the price of six millions of stock at ten per cent., and the dividend is in the mean time to be paid out of the territorial revenues. The whole capital of the East India Company, amounting to L.7,780,000, having been in this manner lost, the inhabitants of Hindustan are taxed to make up the loss. For more than forty years a dividend of ten and a half per cent. has been paid upon East India stock, though in the course of this long period not a shilling of profit has ever been made. So far from it, the Company's affairs have been every day sinking deeper into embarrassment, and a pretended dividend has been paid with borrowed money, by which the original value of the stock has been nearly doubled in the market, and at this high value it is to be redeemed at the expense of the Hindus, who, though they had no share in the profits, are thus brought in to bear the loss. It may be doubted, however, whether any other arrangement would have been practicable. The error was in allowing so large a dividend to be paid with borrowed money; and this evil having gone so far, and many proprietors having purchased stock on the faith of the existing dividend, it would have been a bold measure to have at once annihilated the value of the stock to the amount of twelve millions. The reform of judicial proceedings, and the compilation of a uniform code of laws for Hindus and Mahommedans as well as European subjects, a great and important undertaking, forms part of this comprehensive and enlightened plan for the government of India. Owing to the recent extension of the British empire towards the north, it has been found expedient, for the more efficient administration of these distant territories, to erect a fourth presidency and council at Agra, with the same powers as the other presidencies, and subject also to the supreme authority of the president and council of Bengal.

The following is the latest statement of the Company's affairs:

Territorial and Political Debts Abroad.

Total debts in India bearing interest	L.41,204,416	
Debts in India not bearing interest	11,496,162	
Total territorial debts abroad, 1st May 1831	L.52,700,578	
Territorial and political debts at home	8,497,204	
		L.61,197,782
Commercial debts abroad, 1st May 1832	L.719,499	
At home	1,208,995	
		1,928,494
Commercial bonded debt bearing interest	L3,527,437	
Not bearing interest	15,417	
		3,542,854
Carry forward		L.66,669,130

---

[1] On this clause Colonel Munro justly observes, "This is converting India into a rack-rent estate for England."

Brought forward			L.66,669,130
Territorial and Political Credits Abroad.			
Consisting of cash and bills receivable, &c. at Bengal, Fort George, and Bombay		L.9,018,281	
Stores in the several departments, 1st May 1831		7,098,683	
Debts, including arrears revenue		9,268,484	
Amount of securities purchased by commission for reduction of Indian debt		2,783,624	
Bills of exchange	L.522,139		
From which is deducted on various accounts	519,617		
		2,522	
		L.28,171,594	
Exports of military stores, cargoes, bills of exchange drawn on government, bullion, dead stock, buildings in India L.400,000, buildings of colleges at Halesbury, &c.		1,407,929	
		L.29,579,523	
Commercial Credits Abroad.			
Cash, goods, merchandise at the several presidencies, Cape of Good Hope, China, Canada, Halifax, and debts	L.1,416,246		
At Home.			
Value of goods, cargoes, ships, East India House, warehouses, debt due from public cash	20,230,903		
		21,647,149	
			51,226,672
Balance deficient			L.15,442,458

The East India Company consists, according to the latest calculation, of 3579 proprietors, who meet in a general court and vote. A proprietor of the Company's stock, provided it has been in his possession for twelve months, to the amount of L.1000, has one vote; of L.3000, two; of L.6000, three; and of L.10,000, four votes; 396 proprietors hold stock under L.500, and are not qualified to vote. The total number of voters is estimated at 2600. The proprietors meet every quarter. Their powers were limited to the election of directors, to the framing of bye-laws, and to the control of salaries or pensions exceeding L.200 a year, or gratuities exceeding L.600. In the court of directors and the board of control is vested the sovereignty of India; they regulate by their supreme authority the policy of the resident government, and the court of proprietors has no power to interfere with their orders.

India is divided into the four presidencies of Bengal, Madras, Bombay, and Agra. The presidency of Bengal is the head of the government, and the president is styled the governor-general. He exercises the executive and legislative powers within his presidency; the regulations which he issues having the force of laws, though subject to the revision of the directors and the board of control at home. Formerly these ordinances were not valid until they were publicly exposed for fourteen days, then registered by the king's supreme court, and afterwards subjected to a further ordeal at home. By the new charter of 1833 these restraints on the powers of the governor-general have been removed, and by his authority in council he can even make laws for the regulation of the supreme courts. The business of the executive is divided among five boards; 1*st*, that of revenue; 2*d*, that of customs, salt, opium; 3*d*, that of trade; 4*th*, the military; and, 5*th*, the medical board. There are three boards at Madras, namely, the first and the two last, and one at Bombay. These boards make suggestions, or present drafts of regulations in their respective departments; and all their minutes are laid before the government monthly, and transmitted home for the consideration of the directors and the board of control. The council of the governor-general consists of five members, three of whom are taken from the servants of the Company of three years standing, but the fourth not from the Company's servants; and all are appointed by the directors, subject to the approbation of the king. The commander-in-chief forms the fifth member. In all state questions the governor-general may act without or even against the advice of his council, on his own responsibility. In virtue of his commission as captain-general, he may head the military operations in any part of India. The chiefs of the other presidencies possess the same authority within their respective districts, but may be controlled in all matters of general policy by the governor-general, who has the power of declaring war and of making peace, and of entering into treaties with foreign states; and who may suspend the governors of the other presidencies, proceed thither, and, assuming the supreme authority, sit as president in their councils.

Indian army.

Each presidency has its separate army, commander-in-chief, and military establishment. But the commander-in-chief of the supreme government has a general authority over the military force in the other presidencies. The total armed force in British India is above 200,000. This force consists, 1*st*, of the king's infantry and cavalry; 2*d*, of the East India Company's European engineers, artillery, and infantry; and, 3*d*, of the Company's native artillery, cavalry, and infantry. The European troops in India amount, according to the latest accounts, to 30,864; the native troops to 181,517, highly distinguished by their valour, good conduct, and discipline. The complement of European officers to each regiment is, one colonel, one lieutenant-colonel, one major, five captains, eight lieutenants, and four cornets or ensigns. Of native officers there is a subahdar and jewadar to each company. But no native can ever attain a rank equal to the youngest European ensign. The number of European officers in India was, by a late return, 5531. The expense of the Anglo-Indian army, at each of the three presidencies of Bengal, Madras, and Bombay, in 1830, was, respectively, L.4,329,537, L.3,216,275, L.1,849,510. The Indian marine is inconsiderable, consisting of one frigate, with ten or twelve smaller vessels, and two armed steamers. The British ecclesiastical establishment in India consists of seventy-six European chaplains, who are under the charge of a diocesan at Calcutta, with L.5000 a year, and three archdeacons at each of the presidencies, with a salary of L.2000 a year. By the new charter of 1833 a bishop is to be stationed at each presidency, with a salary of L.2400. There are also Scottish Presbyterian churches at Calcutta, Bombay, and Madras.

Conclusion.

From the preceding view which we have given of the British administration of India, it will be seen that the inhabitants have suffered many serious evils from a foreign yoke; and that the land-tax levied by the East India Company is the standing obstacle to improvement. It is this tax which retards the progress of cultivation, and consequently of population and capital; and is the cause of large tracts of wilderness being still found in a country naturally fertile. All the different collectors in India, and amongst others Colonel Munro, are of opinion that, but for this obstacle, population would increase even faster in Hindustan than in America. Those provinces of India, however, such as Bengal, which have been long under the sway of the British, now exhibit, notwithstanding the high assessment, sensible marks of improvement. The ancient order of landholders, the zemindars, as well as the inferior tenants or occupants, have many of them no doubt been crushed under the pressure of taxation, and have mostly disappeared; but in their place, under the protecting influence of the British government, a middle order has arisen, who have acquired wealth by industry. In the great towns commerce has flourished; large capitals have accumulated, and in many cases have been employed in purchasing the forfeited lands of the zemindars. A new race of proprietors has thus arisen, more enterprising and industrious than the great lords to whom they have succeeded; and by their industry and exertions the land has been improved, and cultivation slowly extended over the jungles and wastes of the lower provinces. With the progress of commerce and of wealth, rice, the great staple of the farmer, has risen in price, and at the same time the wages of labour; a sure criterion of the improving condition of the people. In the interior of Bengal and the upper provinces, the towns are improving both in size and in appearance; and the equal protection extended to all classes by the British rulers has diffused throughout India a sense of security never before experienced under the despotic rulers of former times, and far less amidst the massacres, the pillage, and the intestine disorders, which from time immemorial have afflicted India, and more especially during the last twenty years preceding the Pindaree war. These evil days have passed away; India is now freed from the scourge of internal war, by the decided ascendency of the one great ruling power; and peace, which now reigns over all Hindustan, is of itself so great a blessing, as to compensate in some degree the evils of foreign rule. The European sovereigns of India have committed great errors, first, in discouraging the colonization of the country by Europeans, and, secondly, in the rigorous exclusion of the natives from every place of power, honour, or emolument. In their jealousy of colonization, the East India Company have evinced all that narrow spirit of monopoly by which they would hold possession of the country by any means, however exceptionable. The hereditary aristocracy of India having been ruined by the rigid exactions of the government, the want of their natural influence has been severely felt in all the details of domestic policy. The business of the revenue, the magistracy, and police, fell, as has been shown, into almost irreparable disorder; and these evils were, by all the most experienced servants of the Company, and by the directors at home, ascribed to the degradation and ruin of the ancient gentry and landholders, who had great authority and respect among the people, and who were universally looked up to as the guardians of civil order. On this subject, Mr Stuart, judge in the Benares division, in a report to government, reasons with great force and clearness, and observes, that the extinction of the aristocracy "may be traced throughout the country as one principal source of the disorders which prevail." (*Fifth Report*, p. 574.) These disorders would have been most effectually remedied by a body of Europeans naturalized in the country, who would have filled up the void in society occasioned by the ruin of the zemindars, and would have diffused amongst the natives the arts, the sciences, the literature, and enlightened morality of Europe; they would have improved the general aspect and condition of Hindu society; and their descendants, familiar with the laws, character, manners, and language of the natives, would have been qualified to act as the rulers and legislators of the country. Owing to the exclusive policy which has been followed, the government of India has been composed of a small body of foreigners, who engross from their rightful owners every part of honour or profit. The standing policy of the Company has been to exclude the natives from every fair object of ambition. Their rise in the army was limited to the command of a platoon of Sepoys; in the civil service to some petty office, alike insignificant in its functions and its pay. A proscription so universal was calculated to produce the most unfavourable effects on the national character. By narrowing the sphere of ambition, we diminish the incentives to active exertion, we take away from mankind the motives which prompt them to cultivate their faculties, we weaken the animating principle of all improvement, we relax the moral tone of society, and thus pave the way for the progress of vice and disorder. All accounts accordingly agree that the state of morals in Hindustan has not been improved under the rule of the English. "The decline of morality," says Lord Moira, in his judicial minute, dated the 2d of October 1815, "is stated to be a subject of reproach against us by all the natives whom birth or education have inspired with concern for the good order or well-being of society." Mr Stuart, whose reports on the state of India abound in the most masterly views of the state of property and manners, expresses this opinion in the strongest terms: "As we proceed," he observes, "these provinces will soon present the singular spectacle of a great empire, the government of which rigidly excludes its subjects from every object of fair ambition, which, in the pursuit, could stimulate men to cultivate their faculties, or, in the possession, enlarge their understandings and elevate their minds." "My speculations," he adds, "may have perhaps misled me, but I am persuaded that very unfavourable effects from these causes may already be traced in the habits of our native subjects; and their long continuance must, I think, infallibly end in reducing the whole population to one ignorant, grovelling, litigious, and profligate herd." Colonel Munro, one of the most distinguished officers in the Company's service, decidedly censures the illiberal policy of exclusion; and describes the natives as more patient and laborious than Europeans, as better accountants, as more efficient men of business; and he expresses his surprise that "men of respectable talents should recommend the abolition of Indian and the substitution of European agency to the greatest possible extent. With our limited number of servants," he observes, "we could not do the work of natives, with ten times the number we could only do it ten times worse."[1] The just and liberal views of Colonel Munro and others have been approved of, and the natives have been for some years admissible to civil offices, and to act as civil and criminal judges; and this tardy justice to the natives may be expected to produce the best effects. They are now summoned to sit in the punctayets (native juries), to try in some places criminal, in others both civil and criminal questions. And this enlightened policy has been still further confirmed by the great and memorable measure introduced into parliament by Mr Grant in 1833, for abolishing the commercial privileges, and regulating other complicated concerns, of the East India Company. The free admission of the natives, of whatever religion or caste, to all offices, and of British settlers into any part of India, there to acquire property or land, or to carry on any trade or profession, is calculated to promote the lasting advantage of India, establishing as it does the principles of freedom, not upon the mere arbitrary regulation of the supreme council, which may be recalled, but on the solid authority of a British act of parliament, which no inferior power can disannul.

---

[1] See Copies of several Minutes of Council at the presidencies of Madras, by Sir T. Munro, Mr Græme, Mr Lushington. Judicial Consultation, 3d July 1827.

Under this liberal and comprehensive law, the Magna Charta of Indian freedom, the British merchant may transfer his capital, and his superior intelligence and industry, to the most remote parts of Hindustan; he may engage in trade, in manufactures, or in agriculture; and this free intercourse of India with Britain must in time produce important effects on the character and manners of the people. Hindustan appears, indeed, to be on the eve of a great moral revolution. The spirit of improvement has long slumbered amongst that singular people; and the division of the people into castes, and those superstitions to which they are attached with a blind devotion, are unfavourable to its progress. But the influence of European manners now begins to be seen; and, considering that the Hindus are a conquered people, long bowed under a foreign yoke; that, on the other hand, power, dominion, honour, and promotion, belong to the British; it is no wonder that the prostrate and servile Hindu should be induced gradually to forsake the manners and superstitions, and even the language, of his forefathers, for the enlightened views and purer faith of his victorious preceptors. This great and signal revolution is already begun. The manners, the customs, the language of Britain, are beginning to take root in India. They have been adopted by many natives of distinction, by zemindars, as well as by the rajahs and princes of the country; and from their example they are spreading amongst the other classes. Hindu children of both sexes crowd the British seminaries established at Calcutta; the rising generation resort to the colleges, and are instructed in English literature and science; they frequent the medical and surgical schools; and there is a growing disposition to adopt the free and liberal manners, and all the other improvements, of modern Europe. This moral change, which is already begun, will soon, by the free influx of Europeans, reach the remotest parts of Hindustan. Capital will be introduced, agriculture will be promoted, and improved modes of labour will be adopted. And all these changes will be brought about, not by any violent subversion of existing institutions, but gradually, through the quiet influence of moral causes.

Amongst other sources of improvement in Hindustan, may be reckoned the laudable zeal of the government for the instruction of the people, by the institution of colleges and schools throughout the country, in which are taught all the different branches of literature and science. It was stipulated by the charter in 1814, that a sum of L.10,000 should be annually applied to the purposes of education; which sum has been augmented by the liberality of the government to L.21,884, to L.66,563, and to L.44,330, its amount in 1830. In the Mahommedan College at Calcutta, the pupils are instructed in natural philosophy, theology, law, astronomy, mathematics, geometry, arithmetic, logic, rhetoric, oratory, grammar, in medicine and surgery, and in the English and Arabic languages. There is also a college for the cultivation of Sanscrit and Hindu literature; besides the Anglo-Indian college for instruction in the English languages. Colleges have been established at Delhi and Agra, and primary and elementary schools are dispersed over the whole country. In many cases, the native schools, generally ill conducted, have been improved under the superintendence of the British. In the presidencies of Bombay and Madras numerous schools have been established for the instruction of the natives in all the elementary branches of education; in geography, in mathematics, and in the English language, the knowledge of which is gradually extending amongst the Hindus. And with these institutions for the education of the people is now combined that mighty engine the press, which, though opposed in its first efforts, and rigorously persecuted, has in India, as in all other countries, finally broken down all the restraints of despotism, and achieved its own freedom. It is not above twenty years since one newspaper only was published in Calcutta. In 1833 eight daily newspapers, political and commercial, issued from the Calcutta press; two three times a week, one twice a week, and seven weekly newspapers, some political, others commercial; besides fourteen newspapers in Bengalee or Persian, and monthly, quarterly, and annual publications. At Bombay and Madras political intelligence is dispersed in various journals, some in English, others in the native languages; and throughout the provinces English newspapers are established; whilst at the different courts, at Delhi and at Meerut, the journals are numerous and daily increasing. To those various sources of improvement may be added the missionary labours, which are ardently pursued all over India; in the establishment of schools, in the sending out of preachers, and in the printing and dispersing of the sacred volume and other works in the native languages, on which large sums of money have been expended. Such are the various institutions which are in progress for the civilization of Hindustan, and which are destined ere long to produce important results, not only in that country, but throughout the whole extent of Asia. But those great moral changes which affect the condition of society are in their nature slow and gradual; they cannot be hastened forward, more especially amongst such a people as the Hindus, whose minds are enthralled by the force of their peculiar habits and religion, by immemorial usages, and by the deep-rooted prejudices of ignorance. We cannot expect that long-established habits will be suddenly relinquished, or that fixed impressions will at once yield to the voice of truth. But Great Britain has at last, and in earnest, undertaken the task of instructing her Indian subjects; the foundation is laid; the work of improvement is begun; the seeds of knowledge have been widely dispersed over the congenial soil, and they will assuredly spring up, and in due season yield the desired increase. (F.)

HINGHAM, a town of the county of Norfolk, in the hundred of Forehoe, ninety-six miles from London, situated at the source of the river Yare. The land around is fertile, and there is a market on Thursday. The inhabitants amounted in 1801 to 1203, in 1811 to 1311, in 1821 to 1442, and in 1831 to 1539.

HINNOM, or the *Valley of Hinnom*, in *Ancient Geography*, a place which lay to the south of Jerusalem. It was also called the *Valley of Tophet*, and was remarkable for the cruel and barbarous worship of Moloch, being the place where parents made their children pass through the fire in honour of that idol.

HINZUAN, one of the Comora Islands, situated between Madagascar and the continent of Africa, and otherwise called Anzuame, Anjuan, Juanny, and Johanna.

Hinzuan resembles, according to Sir William Jones's description of it, a vast amphitheatre, of which a general notion may be formed by conceiving a multitude of hills infinitely diversified in figure and magnitude, and thrown together with artless symmetry in all conceivable positions. A series of mountains forms the background. One of these is pointed, about half a mile above the level of the sea, and not more than three miles from the shore; and the whole are richly clothed with fruit trees of exquisite verdure. Beyond this there is another range, partly barren and partly verdant. Nearer the shore there is a vast multitude of cliffs, which push their verdure almost to the water's edge. The rows of palm trees with which it abounds give an enchanting beauty and variety to the scene, and almost appear to have been planted by design. The north side of the island shoots out into two points, which are twenty-six miles distant from each other, with a large bay between them. It is justly considered as a proper place of refreshment for vessels bound to and from the East Indies, yielding limes, lemons, oranges, and many other valuable antiscorbutics.

HIPPARCHUS, the most celebrated astronomer of antiquity, was a native of Nicæa, a city of Bithynia. We have no means of discovering the exact date of his birth or of his death, but we find from Ptolemy that his observations of the heavenly bodies extended from B. C. 162 to 127. His observations were principally taken in the island of Rhodes; but we know nothing of his private history, excepting that he was remarkable for unwearied industry and great love of truth. He seems to have first directed his attention to the rising and setting of stars; and whilst engaged on this subject he composed a commentary on the work of Aratus, and discovered many mistakes, which the latter, or rather Eudoxus, whom he copied, had made in respect to the position of stars. It was not, however, till a much later period that he discovered that the aspect of the heavens had undergone a considerable change since the observations of Eudoxus had been made. His anxiety to arrive at the truth induced him to subject the whole science of astronomy as then known to the strictest examination; and with this view deemed it a matter of the utmost consequence to the success of his ulterior objects, that he should fix with precision the equinoctial and solstitial points, as well as the time which the sun took to pass from one of these points to the other, or, in other words, the exact length of the year. He compared his own observations with those which had been made before his time, and he discovered that the period of 365 days six hours, which had hitherto been considered as the true length of the solar year, was too great by about five minutes. He was the first to perceive that the stars appeared to have a movement parallel to the ecliptic, and he established this doctrine in a work on the retrogradation of the equinoctial points. It was impossible in those early times to calculate with precision the exact quantity of this movement, as he had no observations with which to compare his own except those of Timocharis and Aristillus, who had lived only a short time before. He imagined, however, that it could not be more than 36″ a year, though it is now known that it is in reality 50″. This important discovery would have been sufficient to have immortalized his name, but he possesses many other titles to the admiration of posterity. He was the first to discover the means of determining the inequality of the movement of the sun, or what is called the apparent eccentricity of the solar orbit. He observed that the four parts into which the year is divided by the solstices and equinoxes are by no means equal, the sun occupying ninety-four days and a half in passing from the vernal equinox to the summer solstice, and only ninety-two and a half from the same solstice to the autumnal equinox. It was evident, therefore, that the sun remained 187 days in that part of the ecliptic which lies between the equator and the north pole, and only about 178 in the other part. The only way in which he could account for this apparent inequality of the sun's motion, was by supposing that the earth was not placed exactly in the centre of the circular orbit of the sun, and that his distance from the earth is therefore subject to variation. The distance of the earth from the centre of the orbit is called the *eccentricity;* and it produces an equation between the real and apparent motions, which is called the *equation of the centre.* Hipparchus determined the magnitude of this equation in terms of the radius of the ecliptic, and fixed the position of the line of the apsides, or that which joins the two opposite points of the orbit at the greatest and least distance from the earth. With these data he constructed the first tables of the sun which are mentioned in the history of astronomy. With equal industry and acuteness Hipparchus laboured to bring the still more difficult theory of the moon to a more scientific form. By comparing a great number of observations of eclipses recorded by ancient writers with his own, he was enabled to determine more accurately the period of the moon's revolution relatively to the stars, to the sun, to her nodes, and to her apogee. He calculated with remarkable precision, for the time when he lived, the distance of the moon from the earth, as well as the size of the sun and moon.

The appearance of a new star in the heavens induced Hipparchus to undertake the formation of a catalogue of all the stars visible above his horizon, to fix their relative positions, and to mark their configurations, in order that posterity might be able to detect any changes which might take place in the aspect of the heavens. His catalogue contained 1080 stars. He also invented the planisphere, or method of representing the starry firmament on a plane surface, which afforded the means of solving the problems of spherical trigonometry in a manner often more exact and more commodious than the globe itself. He was the first who demonstrated the methods of calculating triangles, whether rectilineal or spherical; and he constructed a table of chords, from which he drew nearly the same advantages as we derive at present from the tables of sines. Geography is also indebted to him for the happy idea of fixing the position of places on the earth by means of their latitudes and longitudes, and he was the first who determined longitude by the eclipses of the moon. His writings have all unfortunately perished, except a commentary on the poem of Aratus, and a work entitled *Asterismi.* They were first published at Florence, 1567, and afterwards by Petavius in his *Uranologium*, with a Latin translation, Paris, 1630. See Delambre, *Histoire de l'Astronomie Ancienne*, tom. i. p. xxi.; Marcoz, *Astronomie solaire d'Hipparque soumise à une critique rigoureuse, et ensuite rendue à sa vérité primordiale*, Paris, 1828. The views of Marcoz are ably controverted by Letronne in the *Journal des Savans*, 1828 and 1829, January; also by Littrow in the *Vienna Jahrbuch*, 1830, January and March.

HIPPOCENTAUR (composed of ἱππος, horse, κεντεω, *pungo*, I spur, and ταυρος, bull), in *Antiquity*, a fabulous monster, supposed to be half horse and half man. The hippocentaurs seem to have differed from the centaurs in this, that the latter only rode on bullocks, and the former on horses, as the names themselves indicate.

HIPPOCRATES, the greatest physician of antiquity, was born in the island of Cos, in the eightieth Olympiad, and flourished during the Peloponnesian war. He was the first who laid down precepts concerning physic; and, if we may believe the author of the life, which goes under the name of Soranus, he derived his materials from Hercules and Æsculapius. He was first a pupil of his father Heraclides, then of Herodicus, then of Gorgias of Leontium, the orator, and, according to some, of Democritus of Abdera. After being instructed in physic and in the liberal arts, he lost his parents, upon which he left his own country, and practised physic all over Greece, where he was much admired on account of his skill. He was publicly sent for, along with Euryphon, a man superior to him in years, to Perdiccas, king of Macedonia, who was then thought to be consumptive; but Hippocrates, as soon as he arrived, pronounced the disease to be entirely mental, as in truth it proved. Upon the death of his father Alexander, Perdiccas fell in love with Philas, his father's mistress; and this Hippocrates discerned by the great change which her presence always wrought upon him. The cause of his malady being thus ascertained, a cure was soon effected.

Being entreated by the people of Abdera to come and cure Democritus of a supposed madness, he proceeded thither; but, upon his arrival, instead of finding Democritus mad, he discovered that all his fellow-citizens were so, and that Democritus was the only wise man amongst them. From this philosopher he heard much, and learned a great deal of philosophy; a circumstance which has led Cornelius Celsus and some others to imagine that Hippocrates was the disciple of Democritus, though it is probable they never saw each other till this interview, occasioned by the Abderites. Hippocrates also received public invitations to other countries. Thus, when a plague attacked the Illyrians and Pæonians, the kings of those countries begged him to come to their assistance. He did not comply with their request; but learning from the messengers the prevailing direction of the winds, he concluded that the distemper would at length reach Athens; and having foretold what would happen, he applied himself to devise means for mitigating the evil when it should occur. So ardent indeed was his love of Greece, that when his fame had reached Persia, and Artaxerxes entreated him through the Persian governor of the Hellespont to come to him, at the same time promising him great rewards, he refused to go. He also delivered his country from a war which was just ready to break out, by prevailing upon the Thessalians to come to the assistance of his countrymen, a service for which he received the sincere acknowledgments of the Coans. The Athenians also conferred great honours upon him. They admitted him next to Hercules in the Eleusinian ceremonies, conferred on him the freedom of the city, and voted a public maintenance for himself and his family in the Prytaneum or council-house at Athens, where none were maintained at the public charge excepting such as had done public service to the state. He died amongst the Larissæans, at a very advanced age, having, according to some, outlived the usual term of human life, and attained upwards of a hundred years of age.

A complete bibliographical account of the editions, general and partial, of the works of Hippocrates, would occupy many pages; for, independently of the numerous Greek and Latin editions, almost all the modern languages have been enriched with translations of the different treatises of the Greek physician. The number of special editions of his principal works is prodigious. Thus, there have been more than thirty of the Protestation, as many of the book on the Nature of Man, and of that on Airs, Waters, and Places; about fifty on the Books of Epidemics; more than seventy of the Prognostics, and upwards of three hundred editions, with almost as many commentaries in all languages, of his Aphorisms, " ce chef-d'œuvre de l'ésprit humain." The following classification is made on the principle recommended by Erotian, the eldest glossator of Hippocrates, and adopted and improved by Foes: 1. Greek Editions, Venice, 1526, in folio, Aldus and Asulanus; Basil, 1538, in folio, Froben, a more complete and exact edition than the preceding: 2. Greek and Latin Editions, Venice, 1588, in folio, Mercuriali; Frankfort, 1595, 1621, 1624, and 1645, in folio; Geneva, 1657, in two vols. folio; Leyden, 1665, in two vols. 8vo; the Variorum edition, Vienna, 1743–1749, in two vols. folio, Stephen Mack: 3. Latin Editions, Rome, 1525, in folio, Calvo; Rome, 1549, 1610, 1619, in folio; Basil, 1526, in folio; Venice, 1545, in folio, the version of Cornarius; Basil, 1588, in folio; Venice, 1575, in folio, Marinelli; Frankfort, 1596, in 8vo, Foes; Altenburg, 1806, in three vols. 8vo, Pierer, with a learned dissertation on the state of medicine before the time of Hippocrates: 4. Greek and French Edition, Paris, 1811, 1815, in four vols. 12mo: 5. Numerous editions in French and other modern languages.

HIPPOCRENE, in *Ancient Geography*, a fountain of Mount Helicon, on the borders of Bœotia, sacred to the Muses. Some of the poets, as Ovid, make Hippocrene the same with Aganippe.

HIPPODROME, HIPPODROMUS (composed of ἱππος, *horse*, and δρομος, *course*), in *Antiquity*, a list or course where chariot and horse races were performed, and horses exercised. The Olympian hippodrome or course was a space of ground of six hundred paces in length, surrounded with a wall, near the city Elis, on the banks of the river Alpheus. It was uneven, and in some degree irregular, on account of the situation; in one part there was a hill of a moderate height, and the circuit was adorned with temples, altars, and other embellishments. Constantinople had a famous hippodrome, which was begun by Alexander Severus, and finished by Constantine. This circus, called by the Turks *Atmeidan*, is four hundred paces in length, and above a hundred paces in breadth. At the entrance of the hippodrome there is a pyramidal monólith obelisk of granite, about fifty feet in height, terminating in a point, and charged with hieroglyphics. The Greek and Latin inscriptions on its base show that it was erected by Theodosius; the machines which were employed to raise it are represented on it in basso-relievo.

HIPPOLYTE, ST, a city of the arrondissement of St Vigan, in the department of the Gard, in France, situated on the river Bidourle, at the foot of the Cevennes, containing 650 houses and 5479 inhabitants, who carry on many tanneries, and considerable manufactures of silk, woollen, and cotton goods.

HIPPOLYTE, *St*, a town of the arrondissement of Colmar, in the department of the Upper Rhine, in France, on the river Eckenbache. It contains 500 houses, and 1994 inhabitants, some of whom dig good coals in the vicinity.

HIPPOLYTUS, a son of Theseus and Hippolyte, and celebrated in fabulous history for his virtue and his misfortunes. His stepmother Phædra fell in love with him, and when he refused to pollute his father's bed, she accused him to Theseus of offering violence to her person. Her accusation was readily believed, and Theseus entreated Neptune to punish the incontinence of his son. Hippolytus fled from the resentment of his father; and as he pursued his way along the sea shore, his horses were so frightened at the noise of sea calves, which Neptune had purposely sent there, that they ran amongst the rocks, in consequence of which his chariot was broken and his body torn in pieces. Temples were raised to his memory, particularly at Trœzen, where he received divine honours. According to some accounts, Diana restored Hippolytus to life.

HIPPOMANES, a sort of poison, famous amongst the ancients as an ingredient in love-charms. The word is Greek, ἱππομανες, composed of ἱππος, *a horse*, and μανια, *fury* or *madness*. At the end of Bayle's dictionary there is a very learned dissertation on the hippomanes, and all its virtues, both real and pretended.

HIPPONAX, a Greek poet of Ephesus, son of Pythes and Protis (Suid.), who seems to have flourished in the times of Crœsus and Cyrus, B. C. 546 (Marm. Arund.), which agrees sufficiently with the statement of Pliny, that he lived about the sixtieth Olympiad (B. C. 540). He was thus about half a century subsequent to Archilochus, to whose history that of Hipponax bears a strong resemblance. Hated by the tyrants of his country, Athenagoras and Comas, he was obliged to fly, and proceeded to take up his residence at Clazomenæ, another city of Ionia, where, according to some, he died of hunger and want. In the history of poetry he is celebrated as the inventor of a species of iambic verse, which is called choliambi, because the line is imperfect. It is said that we are indebted for its invention to the circumstance of his dispute with two sculptors of Ephesus, Bupalus and Anthermus, who had exposed the poet to the ridicule of his countrymen by a hideous and grotesque representation of him. The poet took ample revenge on the sculptors by a lampoon of so cutting a character that they are said to have hanged themselves. (Plin. xxxvi. 5; Ælian. V. H. x. 6; Hor. Epod. vi. 11; Callimach. Fragm. xc.) The quality for which he was most distinguished was bitterness; and, in allusion to this, it is said that his grave was strewed with thorn bushes instead of vine branches and ivy. (Alcæus Messen. Anthol. Palat. vii. 536.) Besides the choliambi, he wrote also poetry in regular iambic measure. Little of the poetry of Hipponax has been preserved; only a few lines quoted by scholiasts and grammarians have been transmitted to us, but these have been carefully collected by Welcher, *Hipponactis et Ananii Iambographorum Fragmenta*, Göttingen, 1817.

HIPPOPODES, HIPPOPEDES, or *Hippopodiæ* (composed of ἱππος, *horse*, and πους, *foot*), in *Ancient Geography*, an appellation given to a certain people on the shores of the Scythian Sea, who were supposed to have had horses' feet. The hippopodes are mentioned by Dionysius (*Geogr.* v. 310.), Mela (lib. iii. cap. 6), Pliny (lib. iv. cap. 13), and St Augustin (*De Civit.* lib. xvi. cap. 8). But it is conjectured that they received this appellation on account of their swiftness. Pennant supposes them to have been the inhabitants of the Bothnian Gulf, and that they were the same people as the *Finni Lignipedes* of Olaus. They wore snow-shoes, which, he thinks, might fairly give the idea of their being, like horses, hoofed and shod.

HIPPOPOTAMUS, the RIVER-HORSE. See MAMMALIA.

HIRCUS, in *Astronomy*, a fixed star of the first magnitude, the same with Capella.

HIRE, PHILIP DE LA, one of the most laborious and most useful of the French geometricians, was born at Paris in the year 1640. His father, who was painter to the king, designed to bring up his son to the same profession, and with this view taught him drawing and such parts of the mathematics as are intimately connected with it. At the age of twenty he visited Italy to enlarge his knowledge of his favourite art, and resided in that country about four years. But the study of the mathematics, which he continued to prosecute on his return to his native city, afterwards engaged his whole attention; and the publication of some works having procured him a high reputation, he was chosen a member of the Academy of Sciences in the year 1678. When the minister Colbert conceived the design of constructing a better map of France than any at that time to be met with, Lahire was nominated, in conjunction with Picard, to make the necessary observations; and this engaged his attention for some years in the different provinces. In the year 1683 he was employed in continuing the meridian line which had been commenced by Picard in 1669. He continued it from Paris towards the north, whilst Cassini carried it on towards the south; but on the death of Colbert, which happened the same year, the work was discontinued. He was afterwards employed, in conjunction with other eminent philosophers, in taking the necessary levels for the grand aqueducts about to be constructed by Louis XIV. The works published by Lahire are very numerous; and as he was professor of the Royal College and Academy of Architecture, he must have been constantly employed. He had the circumspection and prudence of an Italian, which made him appear reserved in the estimation of his versatile countrymen, yet he was regarded by all as an honest and disinterested man. Lahire died in the year 1718, at the advanced age of seventy-eight. His principal works are, 1. Nouvelle Méthode de Géometrie pour les Sections des Superficies Coniques et Cylindriques, Paris, 1673, in 4to; 2. De Cycloïde Opusculum, ibid. 1676, in 4to; 3. Nouveaux Eléments des Sections Coniques, les Lieux Géometriques, la construction ou affection des Equations, ibid. 1679, in 12mo; 4. La Gnomonique, ou l'art de tracer des cadrans, ibid. 1682, in 12mo; 5. Sectiones Conicæ, in ix. libros distributæ, ibid. 1685, in folio; 6. Tabulæ Astronomicæ, Ludovici Magni jussu et munificentia exaratæ, ibid. 1702, in 4to; 7. L'Ecole des Arpenteurs, avec un Abrégé du Nivellement, Paris, 1689, in 8vo, reprinted in 1692 and in 1728; 8. Traité de Mécanique, où l'on explique tout ce qui est nécessaire dans la pratique des Arts, ibid. 1675, in 12mo; 9. A great number of *Mémoires*, in different journals, and in the Collection of the Academy. Lahire was besides the editor of the *Traité du Nivellement* by Picard; of the *Traité du Mouvement des Eaux* by Mariotte, and joint editor with Boivin and Thévenot of the *Veteres Mathematici Græc. et Latin.* 1693, in folio.

HIRSCHBERG, a city, the capital of a circle of the same name, in the Prussian province of Silesia. It stands at the influx of the Zachen into the river Baber. It is well built and fortified, and contains four Catholic churches and one Lutheran, 944 houses, and 6458 inhabitants. It is the great market-place for the sale of the linen cloth of Silesia. The city has declined much in prosperity from the falling off of that branch of industry, which has been encroached on by cotton goods. Long. 15. 36. 35. E. Lat. 50. 54. 39. N.

HIRTIUS, AULUS, a noble Roman who attended on Cæsar in his wars against the Gauls, and, when he returned to Rome, became the devoted friend of Cicero. He accompanied him to Tusculum, where he studied the art of declamation under that accomplished orator (Cic. *Fam.* vii. 33); and when Cæsar returned from his successful expedition against his enemies in Africa, he was employed by Cicero to make his peace with the conqueror. Hirtius continued a firm friend to Cæsar, and on his death became an equally determined opponent of the ambitious views of Antony. He was elected consul B. C. 43, with Pansa, and, after his recovery from a severe illness, proceeded with his colleague to relieve Brutus, who was besieged in Mutina by Antony. They gained the battle, and put Antony to flight; but Hirtius fell in his attack on the camp (Phil.

vii. v.; *Fam.* x. 33; Liv. *Ep.* 119). He is supposed by some to have been the author of the eighth book of Cæsar's Commentaries, and also of the Alexandrine, African, and Spanish wars; though the truth of this statement was doubted even in the age of Suetonius.

HISPANIA, called *Hesperia Ultima*, as being the westernmost part of Europe, and also *Iberia*, from the river Iberus. The name *Hispania* is of Phœnician origin, the Phœnicians, who settled several colonies on the coast, calling it *Spanjah*, from the great number of rabbits in the country. It has the sea on every side, except on that next to Gaul, from which it is separated by the Pyrenees. The Romans at first divided it into the Farther and Hither Spain, which were governed by two prætors. In that state it continued till the time of Augustus, who divided Farther Spain into Bætica, which he left to be governed by a proconsul, and into Lusitania, which he added to his own provinces; calling Hither Spain *Tarraconensis*. Hispania was anciently celebrated for its fertility. The people were of a warlike turn; and their bodies being formed for hardships and labour, they preferred war to peace, and were remarkably prodigal of life.

HISPANIOLA, called also St Domingo. See St Domingo.

HISSAR Ferozeh, a large district of Hindustan, in the province of Delhi, situated between the 28th and 30th degrees of north latitude, on the western side of the river Jumna. The country is fertile, but labours under a scarcity of water, which detracts from its fertility. It is only watered by one small stream, namely, the Sursutty. In order to supply the means of irrigation, one of the Afghan emperors, who lived in the fourteenth century, caused two canals to be cut, one from the Sutledge and the other from the Jumna, both of which joined at the city of Hissar, whence they are supposed to have been divided into a number of branches, so that the water was nearly all distributed over the lands, and the remainder fell into a lake called Bhedar. Under the influence of this extensive irrigation the country became fertile, and yielded two abundant crops in the year; and, from this circumstance, a part of it received the name of Hurriana, or the verdant mead. All these great works are now ruined; but the country still produces horses, camels, and cattle. The inhabitants are chiefly Jauts, with the exception of a few Rajpoots; there are also villages of Rajpoots who have embraced the Mahommedan religion. This district imports matchlocks, swords, coarse white cloth, salt, sugar, and a small quantity of rice and spices. The exports are horses, camels, bullocks, and ghee. The chief towns are Hissar, Hansy, and Ferozeh. During the prosperity of the Mogul government, this district was considered the personal estate of the heir apparent to the throne. It is now parcelled out amongst a number of native chiefs. The town of Hissar is the capital of the district. It was built by Sultan Feroz, who gave previous directions for the digging of the two canals above mentioned; after which he laid the foundations of the town and fortress, which he built of stone brought from the neighbouring hills of Nosa, and was completed in less than three years. Long. 75. 53. E. Lat. 28. 41. N.

HISTORY.

History, in general, signifies an account of the remarkable events which have happened in the world, arranged in the order in which they actually occurred, together with an explanation of the causes to which they were owing, and of the different effects they have produced as far as can be discovered. The word is Greek, Ἱστορια, and literally denotes a search of curious things, or a desire of knowing, or even a rehearsal of things we have seen, being formed from a word which properly signifies to know a thing by having seen it. But the idea now attached to the word is much more extensive, and it is applied to the knowledge of things derived from the report of others. Its origin is from the verb *ἰσημι, I know;* and hence it is that, amongst the ancients, several of their great men were called *polyhistores*, or persons of various and general knowledge. Sometimes, however, the word History is used to signify a description of things, as well as an account of facts. Thus Theophrastus calls the work in which he has treated of the nature and properties of plants, an History of Plants; we have also a treatise of Aristotle, entitled an History of Animals; and to this day the descriptions of plants, animals, and minerals, are called by the general name of Natural History.

But that which chiefly merits the name of history, and which is here considered as such, is an account of the principal transactions of mankind since the beginning of the world; and this is naturally divided into two parts, *civil* and *ecclesiastical*. The first contains the history of mankind in their various relations to one another, and of their actions, for their own benefit, or that of others, in common life; the second considers them as acting, or pretending to act, in obedience to that which they believe to be the will of the Supreme Being. Civil history, therefore, includes an account of all the different states which have existed in the world, and likewise of those men who in different ages have most eminently distinguished themselves either for good or evil actions. This last portion of civil history is usually termed Biography.

1. CIVIL HISTORY.

History, though apparently incapable of any natural division, will yet be found, on a nearer inspection, to resolve itself into the following periods: 1. The creation of man; 2. The deluge; 3. The commencement of profane history, when the fabulous relations of heroes and demigods were expelled from historical narratives, and men began to relate facts with some regard to truth and credibility; 4. The conquest of Babylon by Cyrus, and the destruction of the Babylonian empire; 5. The reign of Alexander the Great, and the overthrow of the Persian empire; 6. The destruction of Carthage by the Romans, when the latter had no longer any rival capable of opposing their designs; 7. The reign of the Emperor Trajan, when the Roman empire reached its utmost limits; 8. The division of the empire under Constantine; 9. The destruction of the western empire by the Heruli, and the settlement of the different European nations; 10. The rise of Mahommed, and the conquests of the Saracens and Turks; 11. The Crusades; and, lastly, all the space intervening between that time and the present.

First period.

Historians and chronologers are not agreed as to the number of years which have elapsed since the creation of the world. The compilers of the *Universal History* determine it to have taken place 4305 years before Christ, so that, according to them, the world is now (1835) in the 6140th year of its age. Others think it was created only 4000 years before Christ, so that it has not yet attained its 6000th year. Be this as it may, however, the account of the creation rests wholly on the truth of the Mosaic history; and this we must of necessity admit, because we can find no other which does not either abound in the grossest absurdities, or involve us in absolute darkness. The Chinese and Egyptian pretensions to antiquity are too absurd and ridiculous to require serious confutation. Some historians and philosophers are inclined to discredit the Mosaic account, from the appearances of volcanoes, and other natural phenomena, exhibited in the internal structure and constitution of the earth. But their objections are by no means sufficient to invalidate the authority of the sacred writings; and their own systems are in fact liable to insuperable objections. It is therefore reasonable to adopt as true the Mosaic account of the creation. But an historian is under an absolute necessity of doing so, because, without it, he is destitute of any standard or scale by which he can reduce the chronology of different nations to any agreement; indeed, without receiving this account as true, it would be in a manner impossible at this day to write a general history of the world.

The transactions during the first period, that is, from the creation to the deluge, are very imperfectly known, nothing being recorded of them but what is to be found in the first six chapters of Genesis. In general, however, we learn that men were not at that time in a savage state. They had made some progress in the arts, invented music, and found out the method of working metals. They seem also to have lived in one vast community, without any of those divisions into different nations which have since taken place, and which is supposed to have proceeded from the confusion of languages. The most material part of their history, however, is, that having once begun to transgress the divine commands, they proceeded to greater and greater degrees of wickedness, till at last the Deity thought proper to overwhelm the earth with a deluge, which destroyed the whole human race except eight persons, namely, Noah and his family. This terrible catastrophe happened, according to the Hebrew copy of the Bible, 1656 years after the creation; according to the Samaritan copy, 1307. For the different conjectures concerning the natural causes of the flood, see the article Deluge.

Second period.

For the history of the second period, that of the deluge itself, we must also have recourse to the Scriptures. We now find the human race reduced to eight persons, possessed of nothing but what they had saved in the ark, whilst the earth, desolated by the flood, had to be re-stocked with animals from those which had been preserved along with the eight persons who had escaped the general destruction. In what country this original settlement was effected, we are not informed. The ark is supposed to have rested on Mount Ararat, in Armenia; but it is impossible to ascertain whether Noah and his sons made any stay in the neighbourhood of that mountain. It appears, however, that some time afterwards, the whole or the greater part of the human race were assembled in Babylonia, where they engaged in building a high tower, as a place of refuge in the event of the recurrence of another deluge. This, however, gave offence to the Deity, who punished them by confounding their language; and hence originated the division of mankind into different nations.

According to a common opinion, Noah, when dying, left the whole world to his sons, giving Asia to Shem, Africa to Ham, and Europe to Japhet. But this notion or tradition receives not the least sanction from Scripture. It is believed, however, that Gomer the son of Japhet was the father of the Gomerians or Celts, or, in other words, of all the barbarous nations who under various names inhabited the northern parts of Europe; that from Magog, Meshech, and Tubal, three of Gomer's brethren, proceeded the Scythians, Sarmatians, Tartars, and Moguls; and that from the three other sons of Japhet, Madai, Javan, and Tiras, sprung the Medes, the Ionians, the Greeks, and the Thracians. The children of Shem were Elam, Ashur, Arphaxad, Lud, and Aram. The first settled in Persia, where he became the father of that mighty nation; the descendants of Ashur peopled Assyria or Kurdistan; Arphaxad settled in Chaldæa; Lud is supposed by Josephus to have taken up his residence in Lydia, though this is disputed; and Aram is thought to have settled in Mesopotamia and Syria. The children of Ham were Cush, Mizraim, Phut, and Canaan. The first is supposed to have remained in Babylonia, and to have been king of the south-eastern parts of it, afterwards called Khuzistan. His descendants are believed to have removed into the eastern parts of Arabia, from which by degrees they migrated into the corresponding parts of Africa. The second peopled Egypt, Æthiopia, Cyrenaica, Libya, and the other northern parts of the same continent. The place where Phut settled is not known; but Canaan is universally allowed to have settled in Phœnicia, and to have founded those nations who inhabited Judæa, and were afterwards exterminated by the Jews.

Almost all the countries of the eastern continent being thus furnished with inhabitants, it is probable that for many years few or no quarrels would arise between different nations. The paucity of their numbers, their distance from one another, and their diversity of language, would operate as an obstacle to intercommunication. Hence, according to the different circumstances in which the various tribes were placed, some would be more civilized and others more barbarous. In this interval also the different nations probably acquired different characters, which they afterwards retained, and manifested on all occasions; hence the propensity of some nations to monarchy, as the Asiatics, and the enthusiastic desire of the Greeks for liberty and republicanism.

The commencement of monarchical government dates from a very early period, Nimrod the son of Cush having found means to make himself king of Babylonia. In a short time Ashur, having emigrated from the new kingdom, built Nineveh, afterwards capital of the Assyrian empire, and two other cities, called Rezen and Rohoboth, as to the situation of which we are in a state of profound ignorance. Whether Ashur at this time set up as an independent king, or whether he held these cities as vassal to Nimrod, is unknown. It is probable, however, that about the same time various kingdoms were founded in different parts of the world; and these were great or small according to circumstances. The Scripture mentions the kings of Egypt, Gerar, Sodom, and Gomorrha, in the time of Abraham; and we may reasonably suppose that these kings reigned over nations which had existed for some time before.

The first considerable revolution we read of is the migration of the Israelites out of Egypt, and their establishment in the land of Canaan. For the history of these transactions we must refer to the Old Testament, where the reader will find that it was attended with a terrible catastrophe to the Egyptians, and with the utter extermination of some nations, the descendants of Ham, who inhabited Judæa. How far the overthrow of Pharaoh in the Red Sea affected the Egyptian nation cannot easily be determined; and in fact it seems exceedingly difficult to account for the total silence of their records concerning so remarkable an event, as well as for the general obscurity and uncertainty in which the early history of Egypt is involved. The settlement of the Jews in the promised land of Canaan is supposed to have happened about 1491 before Christ.

For nearly two centuries after this period, we find no accounts of any other nation than those mentioned in Scripture. About 1280 before Christ, the Greeks began to make other nations feel the effects of that enterprising and martial spirit for which they were so remarkable, and which they had undoubtedly exercised upon one another long before. Their first enterprise was an invasion of Colchis, now Mingrelia, for the sake of the golden fleece. Whatever was the nature of this expedition, they appear to have succeeded in it; and it is likewise probable, that it was this specimen of the riches of Asia which ever afterwards inclined them so much to Asiatic expeditions. All this time we are totally in the dark concerning the state of Asia and Africa, excepting in as far as can be conjectured from Scripture.

About 1184 years before Christ, the Greeks again distinguished themselves by their expedition against Troy, a city of Phrygia Minor, which they plundered and burned, massacring the inhabitants with the most unrelenting cruelty. Æneas, a Trojan prince, escaped with some followers into Italy, where he is supposed to have become indirectly founder of the Roman empire. At this time Greece was divided into a number of small principalities, most of which seem to have been in subjection to Agamemnon king of Mycenæ. In the reign of Atreus, the father of this Agamemnon, the Heraclidæ, or descendants of Hercules, who had been formerly banished by Eurystheus, were again obliged to leave this country. Under their champion Hyllus they claimed the kingdom of Mycenæ as their right, pretending that it belonged to their great ancestor Hercules, who was unjustly deprived of it by Eurystheus. The controversy was decided by single combat; and Hyllus being killed, they departed, as had been before agreed upon, under a promise of not making any attempt to return for fifty years. About the epoch of the Trojan war, the Lydians, Mysians, and some other nations of Asia Minor, are first mentioned in history. The names of the Greek states mentioned during this uncertain period are, Sicyon, Leleg, Messina, Athens, Crete, Argos, Sparta, Pelasgia, Thessaly, Attica, Phocis, Locris, Ozela, Corinth, Eleusina, Elis, Pilus, Arcadia, Ægina, Ithaca, Cephalonia, Phthia, Phocidia, Ephyra, Æolia, Calista, Thebes, Ætolia, Doloppa, Œchalia, Mycenæ, Eubœa, Mynia, Doris, Phera, Iola, Trachina, Thresprotia, Myrmidonia, Salamine, Scyros, Hyperia or Melite, the Vulcanian isles, Megara, Epirus, Achaia, and isles of the Ægean Sea. Concerning many of these we know nothing besides their names; and the most remarkable particulars concerning the others may be found under these respective heads.

About 1048 before Christ, the kingdom of Judæa under David approached its utmost extent of power. In its most flourishing condition, however, it was never remarkable for the largeness of its territory. In this respect it scarcely exceeded the kingdom of Scotland; though, according to the accounts given in Scripture, the magnificence of Solomon was superior to that of the most potent monarchs on earth. This extraordinary wealth was owing partly to the spoils amassed by David in his conquests over his various enemies, and partly to the commerce with the East Indies which Solomon had established. Of this commerce he owed his share to the friendship of Hiram king of Tyre, a city of Phœnicia, the inhabitants of which were then the most famed for commerce and skill in maritime affairs of any in the world.

After the death of Solomon, which happened about 975 before Christ, the Jewish empire began to decline; and soon afterwards many powerful states arose in different parts of the world. The disposition of mankind in general seems now to have taken a new turn, not easily to be accounted for. In former times, whatever wars might occur between neighbouring nations, we have no account of any extensive empire in the world, or of any prince undertaking to reduce distant nations under subjection. The empire of Egypt indeed is said to have been of great extent, even before the days of Sesostris, who was also a great conqueror. Of the remote history of this country, however, our knowledge is so imperfect, that scarcely any thing certain, or even probable, can be concluded from it. But now, as it were all at once, we find almost every nation aiming at universal monarchy, and refusing to set any bounds whatever to its ambition. The first shock given to Jewish greatness was the division of the kingdom, through the imprudence of Rehoboam. This rendered it more easily a prey to Shishak, king of Egypt, who five years afterwards came and pillaged Jerusalem, and all the fortified cities of the kingdom of Judah. The commerce to the East Indies was now discontinued, and consequently the sources of wealth were in a great measure cut off; and this, added to the perpetual wars between the kings of Israel and Judah, contributed to that remarkable and speedy decline which now took place in Jewish affairs.

This Shishak, who undertook the expedition against Jerusalem, recorded in Scripture, is now known to be identical with the Scheshonk mentioned on the Egyptian monuments. His infantry is described as an innumerable host, composed of different African nations; and his cavalry is stated at sixty thousand, with twelve hundred chariots. These numbers are most probably exaggerated, and all that we can infer from them is, that the invading host was too numerous to be resisted by any force which could be brought against it. We may also observe, that the policy of the elder Pharaohs seems to have differed entirely from that pursued by their successors. In the earlier ages of the monarchy, the sovereigns of Egypt, animated by a spirit of conquest, sought to extend their dominions by the power of the sword, and, with this view, undertook distant expeditions. But experience at length convinced them of the extreme hazards incident to a system of aggression on the part of a country which, from its position and configuration, was peculiarly open to attack; reverses taught wisdom even to those who are generally the last to profit by the severe lessons of adversity; and a change of system ensued. It was felt that an advanced state of civilisation, surrounded on all sides by barbarism and ferocity, could only maintain itself by concentrating its means, and following a system strictly defensive; that the policy of nations must be accommodated partly to their actual position, and partly to the relations in which they stand to those by whom they are encompassed; and that prudence may long preserve what temerity would speedily overthrow. Hence the aggressive policy of the elder Pharaohs gradually merged into that Chinese system of conservation and exclusion which characterised the government of Egypt at the time when the early Greek writers first became acquainted with the country, and which, from not attending to the change we have alluded to, the latter have described as if it had always prevailed. Shishak or Scheshonk was amongst the last of the Egyptian princes who attempted foreign conquests, or conducted expeditions against the neighbouring nations.

But though the Jews obtained a temporary deliverance from this invader, they were soon afterwards attacked by new enemies. In 941 before Christ, Zerah, an Ethiopian, invaded Judæa with an army, it is said, of a million of infantry and three hundred chariots; but he was defeated with great slaughter by Asa king of Judah, who engaged him with an army of more than half a million of men. About this time also the Syrians, who had grown a considerable people, showed themselves bitter enemies to the kings both of Israel and of Judah, aiming, in fact, at the conquest of both nations. Their kingdom commenced in the days of David, under Hadadezer, whose capital was Zobah, and who probably was at last obliged to become a tributary of David, after having been defeated by him in several engagements. Before the death of David, however, Rezon, who had rebelled against Hadadezer, having found means to make himself master of Damascus, erected a new kingdom, which soon became powerful. The Syrian princes being thus in the neighbourhood of the rival states of Israel and Judah, whose capitals were Samaria and Jerusalem, found it an easy matter to weaken both, by pretending to assist the one against the other; but a detail of the transactions between the Jews and Syrians is to be found in the Old Testament, to which therefore the reader is referred. In 740 before Christ, however, the Syrian empire was totally destroyed by Tiglathpileser, king of Assyria; as was also the kingdom of Samaria by Shalmaneser his successor, about twenty years thereafter. The people were either massacred or carried captive into Media, Persia, and the countries around the Caspian Sea.

Whilst the nations of the East were thus destroying each other, the foundations of formidable empires were laid in the West. In Africa, Carthage was founded by a Tyrian colony, about 869 before Christ, according to those who ascribe the highest antiquity to that city; and in Europe also a considerable revolution took place about 900 before Christ. The Heraclidæ, who had been expelled from Greece by Atreus, the father of Agamemnon, after several unsuccessful attempts, at length conquered the whole Peloponnesus. From this time the Grecian states became more civilized, and their history is less obscure. The institution, or rather the revival and continuance, of the Olympic games, in 776 before Christ, also greatly facilitated the writing, not only of their own history, but of that of other nations; for as each Olympiad consisted of four years, the chronology of every important event became fixed by referring it to these periods or divisions of time. In 748 before Christ, or the last year of the seventh Olympiad, the foundations of the city of Rome were laid by Romulus; and, forty-three years afterwards, the Spartan state was new-modelled, and received from Lycurgus those laws by means of which it afterwards arrived at such a pitch of splendour.

Third period.

With the beginning of the 28th Olympiad, or 568 before Christ, commences the third general period above mentioned, when profane history becomes somewhat more clear, and the relations of different nations may be depended upon with some degree of certainty. The general state of the world was then as follows. At this period, the northern parts of Europe were either thinly inhabited, or filled with unknown and barbarous nations, the ancestors of those who afterwards destroyed the Roman empire. France and Spain were inhabited by the Gomerians or Celts. Italy was divided into a number of petty states, consisting partly of Gaulish and partly of Grecian colonies, amongst whom the Romans had already become formidable. The latter were governed by their king Servius Tullius; had increased their city by the demolition of Alba Longa, and the removal of its inhabitants to Rome; and had enlarged their dominions by several cities taken from their neighbours. Greece was also divided into a number of small states, amongst which the Athenians and Spartans, the most remarkable, were rivals. The former had, about 599 before Christ, received an excellent system of laws from Solon, and were enriching themselves by navigation and commerce. The latter were become formidable by the martial institutions of Lycurgus, and, having conquered Messenia, and added its territory to their own, were justly esteemed the most powerful people in Greece. The other states of most consideration were Corinth, Thebes, Argos, and Arcadia. In Asia great revolutions had taken place. The ancient kingdom of Assyria was destroyed by the Medes and Babylonians, its capital city Nineveh was utterly ruined, and the greater part of its inhabitants were carried to Babylon. Nay, the very materials of which it was built were carried off, to adorn and give strength to that stately metropolis, which was then undoubtedly the first city in the world. By Nebuchadnezzar, who now sat on the throne of Babylon, the kingdom of Judæa was totally overthrown in 587 before Christ. Three years before this he had taken and razed the city of Tyre, and overrun all the kingdom of Egypt. He is even said by Josephus to have conquered Spain, and reigned there nine years, after which he abandoned it to the Carthaginians; but this seems by no means probable. The extent of the Babylonian empire is not certainly known. But, from what is recorded of it, we may conclude that it was not at all inferior in magnitude to any that had ever existed; and the Scripture informs us that it was superior in wealth to any of the succeeding ones. We know that it comprehended Phœnicia, Palestine, Syria, Babylonia, Media, and Persia, and not improbably India; and, from a consideration of this vast extent of territory, and the riches with which every one of these countries abounded, we may form some idea of the wealth and power of this monarch. When we consider also, that the whole strength of this mighty empire was employed in beautifying the metropolis, we cannot consider the wonders of that city, as related by Herodotus, as at all incredible. As to what passed about this time in the republic of Carthage we are left quite in the dark; there being a chasm in its history of not less than three hundred years.

Fourth period.

The fourth general period of history, namely, from the end of the fabulous times to the conquest of Babylon by Cyrus, is very short, including no more than thirty-one years. This sudden revolution was occasioned by the misconduct of Evilmerodach, Nebuchadnezzar's son, even in his father's life-time. For having, in a great hunting match on occasion of his marriage, entered the country of the Medes, and some of his troops coming up at the same time to relieve the garrisons in those places, he joined them to those already with him, and without the least provocation began to plunder and lay waste the neighbouring country. This produced an immediate revolt, which quickly extended over all Media and Persia. The Medes, headed by Astyages, and his son Cyaxares, drove back Evilmerodach and his party with great slaughter; nor does it appear that they were afterwards reduced even by Nebuchadnezzar himself. The new empire continued daily to gather strength; and at last Cyrus, grandson to Astyages, a prince of great prudence and valour, being appointed generalissimo of the Median and Persian forces, took Babylon itself in the year 538 before Christ.

During this period the Romans increased in power under the wise administration of their king Servius Tullius, who, though a pacific prince, rendered his people more formidable by a peace of twenty years than his predecessors had done by all their victories. The Greeks, even at this early period, began to interfere with the Persians, on account of the Ionians, or Grecian colonies in Asia Minor. These had been subdued by Crœsus king of Lydia about the year 562, the time of Nebuchadnezzar's death. Whether the Lydians had been subdued by the Babylonian monarch or not, cannot now be ascertained, though it is very probable that they were either in subjection to him, or greatly awed by his power, as before his death nothing considerable was undertaken by them. It is indeed probable, that during the insanity of Nebuchadnezzar, spoken of by Daniel, the affairs of his kingdom must have fallen into confusion; and that many of those princes whom he had formerly retained in subjection must have set up for themselves. Certain it is, however, that if the Babylonians did not regard Crœsus as their subject, they looked upon him as a faithful ally; insomuch that they celebrated an annual feast in commemoration of a victory obtained by him over the Scythians. After the death of Nebuchadnezzar, Crœsus subdued many nations in Asia

Minor, and amongst these the Ionians, as already related. They were, however, greatly attached to his government; for though they paid tribute, and were obliged to furnish some forces in time of war, they were yet free from all kinds of oppression. When Cyrus therefore was proceeding in his conquests of different parts of the Babylonian empire, before he proceeded to attack the capital, the Ionians refused to submit to him, though he offered them very advantageous terms. But soon afterwards Crœsus himself being defeated and taken prisoner, the Ionians sent ambassadors to Cyrus, offering to submit on the terms which had formerly been proposed. But these terms were now refused; and the Ionians, having determined to resist, applied to the Spartans for assistance. The Spartans however could not at that time be prevailed upon to give their countrymen any aid; but they sent ambassadors to Cyrus with a threatening message, to which he returned a contemptuous answer, and then forced the Ionians to yield at discretion, five years before the taking of Babylon. Thus commenced the hatred between the Greeks and Persians; and thus in the first two great monarchies the seeds of destruction were sown even before these monarchies were themselves established. For whilst Nebuchadnezzar occupied himself in raising the Babylonian empire, his son was destroying what his father built up; and at the very time when Cyrus was establishing the Persian monarchy, that prince, by his ill-timed severity to the Greeks, rendered that warlike people his enemies. The transactions of Africa during this period are almost entirely unknown; though we cannot doubt that the Carthaginians enriched themselves by means of their commerce, which afterwards enabled them to attain a considerable share of power.

Fift e- riod

Cyrus having now become master of all the East, Asiatic affairs continued for some time in a state of tranquillity. The Jews obtained liberty to return to their own country, to rebuild their temple, and to re-establish their worship, though from that time they must have been in a state of dependence on the Persians. Cambyses, the successor of Cyrus, added to his empire Egypt, which had either not submitted to Cyrus, or had revolted soon after his death. He intended also to have subdued the Carthaginians; but as the Phœnicians refused to supply him with ships to fight against their own countrymen, he was obliged to lay aside this design.

In 517 before Christ, the Babylonians finding themselves oppressed by their Persian masters, resolved to shake off the yoke, and establish their independence. For this purpose, they took care to store their city with all manner of provisions; and when Darius Hystaspes, then king of Persia, advanced against them, they employed a most barbarous method to prevent an unnecessary consumption of the provisions which they had so carefully amassed. Having collected into one place all the women, old men, and children, they strangled them without distinction, whether wives, fathers, mothers, brothers, or sisters; every one being allowed to save only the wife he liked best, and a maid servant to do the work of the house. But this cruel policy did not avail them. Their city, which could not be carried by force, was taken by treachery; after which the king caused the walls to be reduced from two hundred to fifty cubits in height, that their strength might no longer give encouragement to the inhabitants to revolt. Darius then turned his arms against the Scythians; but finding that his expedition against that people proved both tedious and unprofitable, he directed his course eastward, and reduced all the country as far as the Indus. In the mean time the Ionians revolted; and being assisted by the Greeks, a war commenced between the two nations, which was not thoroughly extinguished till the destruction of the Persian empire, in the year before Christ 330. The Ionians, however, after a war of six years, were for this time obliged to submit, and were treated with great severity by the Persians. The conquest of Greece itself was then projected. But the expeditions undertaken with that view ended most unfortunately for the Persians, and encouraged the Greeks to make reprisals, in which they succeeded according to their utmost wishes; and if they had agreed amongst themselves, the overthrow of the Persian empire would not have been reserved for Alexander.

In 459 the Egyptians made an attempt to recover their liberty, but, after a war of six years, they were reduced to submission. In the year 413 they revolted a second time. On this occasion they were assisted by the Sidonians, a circumstance which drew upon the latter that terrible destruction foretold by the prophets; whilst the principals were themselves so thoroughly humbled, that they never afterwards made any attempt to recover their liberty. The cruelties exercised by the Persians in Egypt were without example even in the annals of the barbarous nation by whom they were perpetrated. The familiar illustration of a bull in a china shop presents but a faint image of a fanatical savage with arms in his hands, let loose amidst the monuments of a high civilization. The Egyptians, however, made two gallant efforts to recover their lost independence. Despair gave them courage; and if they had not been tainted with that degeneracy which always follows in the train of refinement, when untempered and unennobled by the spirit of liberty, success would probably have crowned their efforts. But insurrections are always easily put down in countries where the many exist only for the few, where the people are nothing, and the only point at issue is a question between one despot and another.

The year 403 before Christ proved remarkable for the revolt of Cyrus against his brother Artaxerxes Memnon; a revolt in which, through his own rashness, he miscarried, and lost his life at the battle of Cunaxa, in the province of Babylon. Ten thousand Greek auxiliaries, who had served in his army, made their way back to Greece, though in the heart of a hostile country, and surrounded on all sides by the enemy. In this retreat they were commanded by Xenophon, who has received the highest commendation for his conduct and military skill in bringing it to a happy conclusion. Nor can any praise exceed the merit of having successfully conducted so difficult and perilous an enterprise. A rude barbarian, if success happen to crown the first impulsion of brute force, may easily urge on the rolling tide of conquest; but a retrograde movement, like that executed by Xenophon, requires a combination of the highest and noblest powers of the human mind; anxious prudence, invincible fortitude, prompt decision, inexhaustible fertility in resources, and great knowledge of mankind, blended with superior tactical skill and strategical science, intuitive sagacity in discerning the truth amidst conflicting probabilities, and an entire command of all those artifices or stratagems by which the calculations of an enemy may be deranged, whilst the end contemplated is at the same time accomplished. Two years afterwards the invasions of Agesilaus king of Sparta threatened the Persian empire with total destruction; but from this danger it was relieved by his being recalled to defend his country against the other Grecian states.

During this time the volatile and giddy temper of the Greeks, with their enthusiastic desire of romantic exploits, were preparing for themselves fetters which indeed seemed to be absolutely necessary to prevent them from destroying one another. A zeal for liberty was what they all pretended; but upon most occasions it appeared that this love of liberty was only a desire of dominion. No state in Greece could bear to see another equal to itself; and hence their perpetual contests for pre-eminence, which served to weaken the whole body, and to render them an easy prey to an ambitious and politic prince, capable of taking advantage of their intestine divisions. Being all equally impatient of restraint, they never could endure submission to any regular government; and hence their determinations were little else than the decisions of a mob, of which they had afterwards almost constantly reason to repent. Hence also their unworthy treatment of those eminent men whom they ought most to have honoured; of Miltiades, Aristides, Themistocles, Alcibiades, Socrates, Phocion, and others. The various transactions between the Grecian states, though they cut a considerable figure in their own history, make none whatever in a general sketch of the history of the world. We shall therefore merely observe, that in 404 before Christ, the Athenian power was in a manner totally broken by the taking of their city by the Spartans. In 370 that of the Spartans received a severe check from the Thebans at the battle of Leuctra, and eight years afterwards it was still further reduced by the battle of Mantinea. Epaminondas, the great enemy of the Spartans, was killed; but this proved only a more speedy means of subjugating all the states to a foreign, and at that time despicable power. The Macedonians, a barbarous nation, situated to the north of the states of Greece, were, two years after the death of Epaminondas, reduced to the lowest ebb by the Illyrians. The king of Macedonia being killed in an engagement, Philip his brother departed from Thebes, where he had studied the art of war under Epaminondas, to take possession of his kingdom. Being a man of great prudence and policy, he quickly settled his own affairs, vanquished the Illyrians, and, being no stranger to the weakened situation of Greece, began almost immediately to meditate the conquest of it. As the particulars of this enterprise are related under another head, it is sufficient to notice here, that by first attacking those whom he was sure to overcome, by corrupting those whom he thought it dangerous to attack, by pretending sometimes to assist one state and sometimes another, and by imposing upon all as best served his turn, he at last deprived the Greeks of all power of resistance, at least such as could prevent him from attaining his end. In 338 he caused himself to be elected general of the Amphictyons, or council of the Grecian states, under pretence of settling some disturbances which then existed in Greece; but having once obtained liberty to enter that country with an army, he soon convinced the states that they must all submit to his will. He was opposed by the Athenians and Thebans; but the intestine wars of Greece had cut off all her great men, and no general was now to be found capable of opposing him with success.

The king of Macedonia having thus made himself master of the whole of Greece, projected the conquest of Asia. To this he was encouraged by the reverses which had attended the Persians in their expeditions against Greece, the successes of the Greeks in their invasions, and the memorable retreat of the ten thousand under Xenophon. All these events showed the weakness of the Persians, their vast inferiority to the Greeks in military skill, and how easily their empire might be overthrown by a proper union amongst the states. But whilst Philip was preparing to enter upon his grand enterprise, he was murdered by some assassins. His son Alexander, however, was possessed of every quality necessary for the execution of so great a design; and his impetuosity of temper enabled him to carry it into effect with a rapidity unheard of either before or since. It must be confessed, indeed, that the Persian empire was now ripe for destruction, and could not in all probability have withstood an enemy much less powerful than Alexander. The Asiatics have in all ages been much inferior to the European nations in valour and military skill. They were now sunk in luxury and effeminacy; and, what was worse, they seem at this period to have been seized with that infatuation and distraction of councils which scarcely ever fails to prove the forerunner of destruction. The Persian ministers persuaded their sovereign to reject the prudent advice which was given him, to distress Alexander by laying waste the country, and thus forcing him to return for want of provisions. Nay, they even prevented him from engaging the enemy to advantage, by dividing his forces; and persuaded him to put to death Charidemus the Athenian, who had promised with one hundred thousand men, of whom one third were auxiliaries, to drive the Greeks out of Asia. In his Persian expedition, therefore, Alexander met with only two checks. The one was before Tyre, which for seven months resisted his utmost efforts; and the other was from Memnon the Rhodian, who had undertaken to invade Macedonia. The first of these obstacles Alexander at last surmounted, and treated the governor and inhabitants with the utmost cruelty. The other was scarcely felt; for Memnon died after reducing some of the Grecian islands, and Darius had no other general capable of conducting the enterprise. The Persian empire was totally broken by the victory gained over Darius at Arbela in 331, and next year an end was put to the monarchy by the murder of the king, who fell by the hand of Bessus, one of his own subjects.

The ambition of Alexander was not to be satisfied with the possession of the kingdom of Persia, nor indeed of any other on earth. Nothing less than the total subjection of the world itself seemed sufficient to him; and hence he was now prompted to invade every country of which he could only learn the name, whether it had belonged to the Persians or to other nations. In consequence of this disposition, he invaded and reduced Hyrcania, Bactria, Sogdia, and all the vast tract of country now called Bukharia; and having entered India, he reduced all the nations as far as the Hyphasis, one of the branches of the Indus. But when he desired to proceed farther, and extend his conquests to the eastern extremities of Asia, his troops positively refused to follow him, and he was constrained to return. In 323 before Christ this mighty conqueror died of a fever, without having time to settle the affairs of his vast extended empire, or even to name his successor.

Whilst a Grecian empire thus suddenly sprung up in the East, the rival states of Rome and Carthage were making considerable advances in the West. The Romans were establishing their empire on the most solid foundations, to which their particular situation materially contributed. Being originally little better than lawless banditti, they were despised and hated by the neighbouring states; and this soon produced wars, in which, at first from accidental circumstances, and afterwards from their superior valour and conduct, the Romans proved almost constantly victorious. The jealousies which prevailed amongst the Italian states, and their ignorance of their true interest, prevented them from combining against that aspiring nation, and crushing it in its infancy; whilst the Romans, on the other hand, being kept in a state of continual warfare, became at last such expert soldiers, that no other state on earth was capable of resisting them. During the time of their kings they made a considerable figure amongst the Italian nations; but after the expulsion of the kings, and the commencement of the republic, their conquests became much more rapid and extensive. In 501 before Christ they subdued the Sabines; eight years afterwards the Latins; and in 399 before Christ the city of Veii, the strongest in Italy, was taken after a siege of ten years. But, in the midst of their successes, a sudden irruption of the Gauls had almost put an end to their power and existence as a nation. The city was burned to the ground in 383 before Christ, and the capital on the point of being surprised, when the Gauls, who were climbing up the walls in the night, were accidentally discovered and repulsed. In a short time Rome was rebuilt with greater splendour than before; but now there occurred a general revolt and combination of the nations formerly subdued. The Romans however still proved superior to their enemies; but, even at the time of the death of Camillus, which happened about 352 before Christ, their territories scarcely extended six or seven leagues from the capital. The republic from the beginning was agitated by those dissensions which at last proved its ruin. The people had been divided by Romulus into two classes, *Patricians* and *Plebeians*, answering to our nobility and commonalty. Between these two bodies there existed perpetual jealousies and contentions, which retarded the progress of the Roman conquests, and revived the hopes of the nations whom they had conquered. The tribunes of the people were perpetually opposing the consuls and military tribunes. The senate had often recourse to a dictator intrusted with absolute power, and then the valour and experience of the Roman troops rendered them victorious; but the recurrence of domestic seditions gave the subjugated nations an opportunity of shaking off the yoke. Thus the Romans had continued for nearly four hundred years, running the same round of wars with the same enemies, and reaping very little advantage from their conquests, till at last matters were compounded by choosing one of the consuls from amongst the plebeians; and from this time chiefly we may date the prosperity of Rome, so that by the time when Alexander the Great died, they were held in considerable estimation amongst foreign nations.

The Carthaginians in the mean time continued to enrich themselves by commerce; but being less conversant with military affairs, they were by no means equal to the Romans in power, though they excelled them in wealth. During this period, however, a new state made its appearance, which may be said to have taught the Carthaginians the art of war, and, by bringing them into contact with the Romans, proved the original source of contention between these two powerful nations. This was the island of Sicily. At what precise time this island was first settled, has not been ascertained. The earliest inhabitants we read of were called *Sicani, Siculi, Læstrigones;* but of these we know little or nothing. In the second year of the seventeenth Olympiad, or 710 before Christ, some Greek colonies arrived on the island, and in a short time founded several cities, the chief of which was Syracuse. The Syracusans at length subdued the original inhabitants, though it does not appear that the latter were ever well affected to their government. The first considerable prince, or, as he is called by the Greeks, *tyrant* of Syracuse, was Gelon, who obtained the sovereignty about the year 483 before Christ. At what time the Carthaginians first carried their arms into Sicily is not certainly known; but we are assured that they possessed some part of the island as early as 505 before Christ. In the time of the first consuls, the Romans and Carthaginians entered into a treaty chiefly in regard to matters of navigation and commerce, by which it was stipulated that the Romans who might touch at Sardinia, or that part of Sicily which belonged to Carthage, should be received there in the same manner as the Carthaginians themselves. It hence appears that the dominion of Carthage already extended over Sardinia and part of Sicily; but, twenty-eight years afterwards, the Carthaginians had been totally driven out by Gelon. This was probably the first exploit performed by him; at least such is the conclusion deduced from his speech to the Athenian and Spartan ambassadors, who desired his assistance against the forces of Xerxes king of Persia. To regain their possessions in this island the Carthaginians made many attempts, which occasioned long and bloody wars between them and the Greeks. The island also proved the scene of much slaughter and bloodshed in the wars of the Greeks with one another. Previously to the year 323 before Christ, however, the Carthaginians had made themselves masters of a considerable part of it, and from this all the power of the Greeks failed to dislodge them. It is proper also to observe, that after the destruction of Tyre by Alexander the Great, almost all the commerce in the western part of the world fell to the share of the Carthaginians. Whether they had at this time effected any settlements in Spain is not known. It is certain that they traded to that country for the sake of the silver in which it abounded, as, according to most accounts, they did also to Britain for the tin which it produced.

Sixth period.

The beginning of the sixth period presents us with a state of the world entirely different from any thing that preceded it. We now behold all the eastern part of the world, from the confines of Italy to the Indus, and even beyond it, united into one vast empire, and at the same time ready to fall to pieces for want of a proper head; and the western world filled with fierce and savage nations, whom the rival republics of Carthage and Rome were preparing to enslave as fast as they could. The first remarkable events took place in the Macedonian empire. Alexander, as already observed, had not distinctly named any successor; but he had left behind him a victorious and invincible army, commanded by most expert officers, all of them ambitious of supreme authority. It is not to be supposed that peace could long be preserved in such a situation. For a number of years, indeed, nothing was heard of but horrid slaughters, and wickedness of every kind, until at last the mother, wives, children, brothers, and even sisters, of Alexander, were cut off, not one of the family of that great conqueror being left alive. When these disturbances had somewhat subsided, four new empires, each of them of no small extent, arose out of that of Alexander. Cassander, the son of Antipater, received Macedonia and Greece; Antigonus got Asia Minor; Seleucus had Babylon and the eastern provinces; and Ptolemy Lagus obtained Egypt and the western countries of Africa. One of these empires, however, quickly fell to pieces. Antigonus being defeated and killed by Seleucus and Lysimachus at the battle of Ipsus, in 301 before Christ, the greater part of his dominions fell to Seleucus; but several provinces took the advantage of this confusion to shake off the Macedonian yoke, and thus were formed the kingdoms of Pontus, Bithynia, Pergamus, Armenia, and Cappadocia. The two most powerful and permanent empires, however, were those of Syria, founded by Seleucus, and of Egypt, founded by Ptolemy Lagus. The kings of Macedonia, though they did not preserve the same authority over the Grecian states which Alexander, Antipater, and Cassander, had done, yet effectually prevented them from committing those outrages upon one another for which they had formerly been so remarkable. Indeed it is somewhat difficult to determine whether their condition was better or worse than before they were conquered by Philip; for, though they were now prevented from destroying one another, they were grievously oppressed by the Macedonian tyrants.

Whilst the eastern parts of the world were thus deluged with blood, and the successors of Alexander were pulling to pieces the empire which he had established, the Romans and Carthaginians proceeded in their attempts to enslave the nations of the West. The Romans, ever engaged in war, conquered one city and state after another, till about the year 253 before Christ, when they had made themselves masters of almost the whole of Italy. During this time they had met with only a single check in their conquests, namely, the invasion of Pyrrhus, king of Epirus. That ambitious and fickle prince had projected the conquest of Italy, which he fancied would be an easy achievement. Accordingly, in the year 271 before Christ, he entered that country, and maintained a war with the Romans for six years, till at last, being utterly defeated by Curius Dentatus, he was obliged to return humbled to his own country.

The Romans had no sooner made themselves masters of Italy, than they wanted only a pretence to carry their arms beyond it, and it was not long before this pretence was found. Being invited into Sicily to assist the Mamertines against Hiero king of Syracuse and the Carthaginians, they immediately commenced a war with the latter, which continued with the utmost fury for twenty-three years. The war ended greatly to the disadvantage of the Carthaginians, chiefly owing to the bad conduct of their generals, none of whom, Hamilcar Barcas alone excepted, seem to have been possessed of any military skill; and the state had suffered too many misfortunes before he entered upon the command, for him or any other to retrieve its fortunes at that time. The consequences of this war was the entire loss of Sicily; and soon afterwards the Romans seized on the island of Sardinia.

Hamilcar perceiving that in a short time Carthage must either conquer Rome, or Rome would conquer Carthage, bethought himself of a method by which his country might become equal to the haughty republic by which it was threatened. This was by reducing all Spain, in which the Carthaginians had already considerable possessions, and from the mines of which they derived great advantages. He had, therefore, no sooner finished the war with the mercenaries, which succeeded that with the Romans, than he set about the conquest of Spain. This, however, he did not live to effect, though he had made great progress towards its accomplishment. His son Asdrubal continued the war with success, till at last the Romans, jealous of his progress, persuaded him to enter into a treaty with them, by which he engaged himself to make the river Iberus the boundary of his conquests. This treaty was probably never ratified by the senate of Carthage, nor, even if it had, would it have been regarded by Hannibal, who succeeded Asdrubal in the command, and had sworn eternal enmity with the Romans. The transactions of the second Punic war are amongst the most remarkable which the history of the world exhibits. Certain it is, that nothing can show more clearly the slight foundations upon which the greatest empires are built. We find the Romans, the nation most remarkable for their military skill, and who, for more than five hundred years, had been constantly victorious, unable to resist the efforts of a single man. At the same time we observe this man, though evidently the first general in the world, lost solely for want of timely support. In former times, the republic of Carthage had supplied her generals in Sicily with hundreds of thousands, though their enterprises were almost constantly unsuccessful; but now Hannibal, the conqueror of Italy, was obliged to abandon his design, merely for want of twenty or thirty thousand men. That degeneracy and infatuation which never fail to overwhelm a falling nation, or which are rather the causes of its fall, had now infected the counsels of Carthage; the supplies were denied; and the propitious moment was for ever lost. Neither was Carthage the only infatuated nation. Hannibal, whose prudence never forsook him either in prosperity or adversity, had, in the height of his good fortune, concluded an alliance with Philip, king of Macedonia. If that prince had sent an army to the assistance of the Carthaginians in Italy immediately after the battle of Cannæ, there can be no doubt that the Romans would have been forced to accept of the peace which they so haughtily refused; and indeed this offer of peace, in the midst of so much success, is an instance of moderation which perhaps does more honour to the Carthaginian general than all the military exploits which he had performed. Philip, however, could not be roused from his indolence, nor made to perceive that his own ruin was connected with that of Carthage. The Romans having now made themselves masters of Sicily, recalled Marcellus, with his victorious army, to be employed against Hannibal; and the Carthaginian armies being unsupported in Italy, which they were no longer in a condition to conquer, were recalled into Africa, which the Romans had already invaded. The southern nations seem to have been as blind to their own interest as the northern. They ought to have seen that it was necessary for them to preserve Carthage from being destroyed; but instead of this, Masinissa, king of Numidia, formed an alliance with the Romans, and by his means Hannibal was overcome at the battle of Zama, which terminated the second Punic war, in the year 188 before our era.

The event of the second Punic war determined the fate of almost all the other nations in the world. All this time, indeed, the empires of Egypt, Syria, and Greece, had been accelerating their own ruin by mutual wars and intestine divisions. The Syrian empire was now governed by Antiochus the Great, who seems to have had little right to such a title. His empire, though diminished by the defection of the Parthians, was still very powerful; and to him Hannibal applied, after he had been obliged to leave his own country. Antiochus, however, had not sufficient judgment to discern the necessity of following that great man's advice; nor could the Carthaginians be prevailed on to contribute their assistance against the nation which was soon, without any provocation, to destroy them. The pretence for war on the part of the Romans was, that Antiochus refused to declare his Greek subjects in Asia free and independent states; a requisition which neither the Romans nor any other nation had a right to make. The result was, that Antiochus was everywhere defeated, and forced to conclude a peace upon very disadvantageous terms.

In Europe, the course of events was nearly the same. The states of Greece, weary of the tyranny of the Macedonians, entered into a resolution to recover their liberties. For this purpose was framed the famous Achæan League; but as they could not agree amongst themselves, they at last came to the imprudent determination of calling in the Romans to defend them against Philip king of Macedonia. This produced a war, in which the Romans were victorious. The Macedonians, however, were still formidable; and as the intention of the Romans to enslave the whole world could no longer be doubted, Perseus, the successor of Philip, renewed the war. But through his own cowardice he lost a decisive engagement, and with it his kingdom, which submitted to the Romans in 167 before Christ.

Macedonia being thus conquered, the next step was utterly to exterminate the Carthaginians, whose republic, notwithstanding the many disasters which had befallen it, was still formidable. It is true, the Carthaginians had given no offence; nay, they even made the most abject submissions to the republic of Rome. But all this was not sufficient. War was declared a third time against that unfortunate state; and as there was now no Hannibal to command their armies, the city was utterly destroyed, 146 before Christ. The same year the Romans put an end to the liberties they had pretended to grant the cities of Greece, by the entire destruction of Corinth.

After the death of Antiochus the Great, the affairs of Syria and Egypt proceeded from bad to worse. The degenerate princes who filled the thrones of those empires, regarding only their own pleasures, either spent their time in oppressing their subjects, or in attempting to deprive each other of their dominions, and thus became a more easy prey to the Romans. So far indeed were they from taking any means to secure themselves against the overgrown power of the republic, that the kings both of Syria and Egypt sometimes applied to the Romans as protectors. Their downfall, however, did not take place within the period of which we now treat. The only other transaction which makes any considerable figure in the Syrian empire is the oppression of the Jews by Antiochus Epiphanes. After their return from the Babylonian captivity, they continued in subjection to the Persians till the time of Alexander. From that epoch they were alternately subject to the kings of Egypt or Syria, as the fortune of either happened to prevail. Egypt being reduced to a low ebb by Antiochus Epiphanes, the Jews fell under his dominion; and being severely treated by him, imprudently showed some signs of joy on a report of his death. This brought him against them with a powerful army; and, in 170 before Christ, he took Jerusalem by storm, committing the most horrid cruelties on the inhabitants, insomuch that they were obliged to hide themselves in caverns and in holes of the rocks to avoid his fury. Their religion was totally abolished, their temple profaned, and an image of Jupiter Olympius set up on the altar of burnt-offerings; a profanation which is thought to be the "abomination of desolation" mentioned by the prophet Daniel. This revolution, however, was not of long continuance. In the year 167 before Christ, Mattathias restored the true worship in most of the cities of Judæa; and in 168 the temple was purified, and the worship there restored by Judas Maccabæus. This was followed by a long series of wars between the Syrians and Jews, in which the latter were almost always victorious.

Sev h per .

The beginning of the seventh period presents us with a view of the ruins of the Greek empire in the declining states of Syria and Egypt, both of them much circumscribed in limits. The empire of Syria at first comprehended all Asia as far as the river Indus, and beyond it; but in 312 most of the Indian provinces were ceded by Seleucus to Sandrocottus, or Androcottus, a native, who in return gave him five hundred elephants. Of the empire of Sandrocottus we know nothing further than that he subdued all the countries between the Indus and the Ganges; and that from this time the greater part of India became independent of the Syro-Macedonian princes. In 250 before Christ, however, the empire sustained a much greater loss by the revolt of the Parthians and Bactrians from Antiochus Theus. The former could not be subdued; and as they held in subjection the vast tract which now goes under the name of Persia, their defection must be looked on as an irreparable loss. Whether any part of their country was afterwards recovered by the kings of Egypt or Syria is not very certain; nor is it of much consequence, since we are assured that in the beginning of the seventh period, or about a century and a half before Christ, the Greek empires of Syria and Egypt were reduced by the loss of India, Persia, Armenia, Pontus, Bithynia, Cappadocia, Pergamus, and other countries. The general state of the world in 146 before Christ, therefore, was as follows: In Asia were the empires of India, Parthia, and Syria, with the lesser states of Armenia, Pontus, and others above mentioned; to which must be added that of Arabia, which during the sixth period had grown into some consequence, and had maintained its independence from the days of Ishmael the son of Abraham. In Africa were the kingdoms of Egypt and Ethiopia; the Carthaginian territories, now subject to the Romans; and the kingdoms of Numidia, Mauritania, and Getulia, ready to be swallowed up by the same ambitious and insatiable power, now that Carthage, which served as a barrier, had been overthrown. To the south lay some unknown and barbarous nations, secure, by reason of their situation and insignificance, rather than by their strength or distance from Rome. In Europe we find none to oppose the progress of the Roman arms except the Gauls, Germans, and some Spanish nations, all of whom were brave indeed, but, through want of military skill, incapable of contending with such masters in the art of war as the Romans.

The Spaniards had indeed been subdued by Scipio Africanus in the time of the second Punic war; but in 155 before Christ they revolted, and, under the conduct of one Viriathus, who had previously been a robber, held out for a long time against all the armies Rome could send against them. The city of Numantia defied the whole Roman power for six years longer, till at last the inhabitants, reduced to extremity by famine, set fire to their houses, and perished in the flames, or killed one another, so that not one remained to grace the triumph of the conqueror. This calamitous consummation produced a temporary tranquillity in Spain. About the same time Attalus, king of Pergamus, having left by will the Roman people his heirs, they immediately seized on his kingdom, and reduced it to a Roman province, under the name of Asia Proper. Thus they continued to enlarge their dominions on every side, without the least regard to justice, to the means they employed, or to the miseries they brought upon the conquered nations. In 122 before Christ the Balearic Islands, now called Majorca, Minorca, and Iviça, were subdued, and the inhabitants exterminated; and soon afterwards several of the nations beyond the Alps were obliged to submit.

In Africa the crimes of Jugurtha soon afforded this ambitious republic an opportunity of conquering the kingdoms of Numidia and Mauritania; and indeed this is almost the only war in which we find the Romans engaged where their pretensions had the least colour of justice, though in no case whatever could a nation show more degeneracy than the Romans did upon this occasion. The particulars of this war are related under other heads. The event was the total reduction of Numidia, about the year 105 before Christ; but Mauritania and Getulia preserved their liberty for some time longer.

In the East, the empire of Syria continued daily to decline, and thus the Jews not only had an opportunity of recovering their liberty, but even of becoming as powerful, or at least of extending their dominions as far, as in the days of David and Solomon. This declining empire was still further reduced by the civil dissensions between the two brothers Antiochus Grypus and Antiochus Cyzicenus, during which the cities of Tyre, Sidon, Ptolemais, and Gaza, declared themselves independent; and in other cities tyrants started up who refused allegiance to any foreign power. This happened about a century before the Christian era, and seventeen years afterwards the whole was reduced by Tigranes, king of Armenia. But he was defeated by the Romans, who reduced Syria to the state of a province of their empire. The kingdom of Armenia itself, with those of Pontus, Cappadocia, and Bithynia, soon shared the same fate; Pontus, the most powerful of them all, being subdued about 64 before Christ. About this time the kingdom of Judæa was also reduced under the power of the same people. This state owed the loss of its liberty to the same cause which had ruined several others, namely, calling in the Romans as arbitrators between two contending parties. The two sons of Alexander Jannæus, Hyrcanus and Aristobulus, contended for the kingdom; and Aristobulus, being defeated by the party of Hyrcanus, applied to the Romans. Pompey the Great, who acted as ultimate judge in this affair, decided it against Aristobulus, but at the same time deprived Hyrcanus of all power as a king, and even refused him permission to assume the regal title, or to extend his territory beyond the ancient borders of Judæa. He also obliged Hyrcanus to give up all those cities in Cœlosyria and Phœnicia which had been gained by his predecessors, and added them to the newly-acquired Roman province of Syria.

Thus the Romans became masters of the countries of the East, from the Mediterranean Sea to the borders of Parthia. In the West, however, the Gauls still enjoyed liberty, and the Spanish nations bore the Roman yoke with the greatest impatience. The Gauls infested the territories of the republic by frequent incursions; and though several attempts had been made to subdue them, these always proved insufficient till the time of Julius Cæsar. By him, however, they were totally reduced, from the river Rhine to the Pyrenean Mountains, and many of their tribes or branches were almost exterminated. He carried his arms also into Germany and the southern parts of Britain; but in neither of these attempts did he effect any permanent conquests. The civil wars between him and Pompey gave him an opportunity of seizing on the kingdom of Mauritania, and those parts of Numidia which had been allowed to retain their liberty. The kingdom of Egypt alone remained; but to this nothing belonged excepting the country properly so called. Cyrenaica was bequeathed by will to the Romans in the year 58 before Christ; and about the same time the island of Cyprus was seized by them, without any pretence except a desire of possessing the treasure of the king. The kingdom of Egypt continued for some time longer at liberty; but this must in some measure be ascribed to the internal dissensions of the republic, more especially to the amours of Pompey, Julius Cæsar, and Mark Antony, with the famous Cleopatra, queen of Egypt. The battle of Actium, however, determined at one blow the fate of Antony, Cleopatra, and Egypt, which last was reduced to a Roman province about nine years before our era.

Whilst the Romans thus employed every means to reduce the world to subjection, they were making one another feel the same miseries at home which they inflicted upon other nations abroad. The first civil dissensions took their rise at the siege of Numantia, in Spain, which, as we have already observed, resisted the whole power of Rome for six years. On one occasion thirty thousand Romans fled before four thousand Numantines. Twenty thousand were killed in the battle, and the remaining ten thousand were so shut up that they had no means of escape. In this extremity they were obliged to negotiate with the enemy, and a peace was concluded upon the conditions, first, that the Numantines should suffer the Romans to retire unmolested; and, secondly, that Numantia should maintain its independence, and be reckoned amongst the allies of Rome. But the Roman senate, with unexampled injustice and ingratitude, broke this treaty, and in return ordered the commander of their army to be delivered up to the Numantines; but they refused to accept of him unless his army was delivered along with him, and the war was renewed, and ended as already related. The fate of Numantia, however, was soon revenged. Tiberius Sempronius Gracchus, brother-in-law of Scipio Africanus the second, had been the chief promoter of the peace with the Numantines already mentioned, and of consequence had been in danger of being delivered up to them along with the commander-in-chief. This disgrace he never forgot or forgave; and, in order to revenge himself, undertook the cause of the plebeians against the patricians, by whom the former were greatly oppressed. He began with reviving an old law, which had enacted that no Roman citizen should possess more than five hundred acres (*jugera*) of land; and he designed to distribute the excess amongst those who had no lands, and to reimburse the rich out of the public treasury. This law met with great opposition, produced many tumults, and at last ended in the death of Gracchus and the persecution of his friends, several hundreds of whom were put to death in the most cruel manner, without any form of law.

But the disturbances did not cease with the death of Gracchus. New contests ensued on account of the Sempronian law, and particularly giving to the Italian allies the privilege of Roman citizens, which not only produced great commotions in the city, but occasioned a general revolt of the states of Italy against the republic of Rome. This rebellion was not quelled without great difficulty; and in the mean time the city was deluged with blood by the contending factions of Sylla and Marius, the former of whom sided with the patricians, and the latter with the plebeians. These disturbances ended in the perpetual dictatorship of Sylla, about 80 years before Christ.

From this time we may date the loss of Roman liberty; for though Sylla resigned his dictatorship two years afterwards, the succeeding contests between Cæsar and Pompey proved equally fatal to the republic. These contests were decided by the battle of Pharsalia, 43 before Christ, which rendered Cæsar in effect master of the empire. Without loss of time he then passed into Africa, totally defeated the republican army in that continent, reduced the country of Mauritania to a Roman province, and completed the Roman conquests in those parts. His victory over the sons of Pompey at Munda, 40 before Christ, secured him from any further apprehensions of a rival. Being therefore sole master of the Roman empire, and having all the power in his hands, he projected great schemes, tending, according to some, not less to the happiness than to the glory of his country; but he was assassinated in the senate-house, in the fifty-sixth year of his age, and 39 before Christ.

Without investigating the political justice of this action, or the motives of the perpetrators, it is impossible not to regret the death of this great man, when we contemplate the designs which he is said to have formed. Nor is it possible to justify even the most virtuous of the conspirators, when we consider the obligations under which they lay to him they slew; and as to the measure itself, even in the view of expediency, it seems to be generally condemned. But, from the transactions which had long preceded, as well as those which immediately followed, the murder of Cæsar, it is evident that Rome was incapable of preserving its liberty, and that the people had become unfit for being free. The efforts of Brutus and Cassius were therefore unsuccessful, and ended in their own destruction, as well as in that of great numbers of their followers, at the battle of Philippi. The defeat of the republicans was followed by numberless disturbances, proscriptions, and murders, till at last Octavianus, having cut off all who had the courage to oppose him, and finally obtained the superiority over his rivals by the victory at Actium, put an end to the republic in the year 27 before Christ.

The destruction of the Roman commonwealth proved advantageous to the few nations of the world who still retained their liberty. That outrageous desire of conquest which had so long marked the Roman character in a great measure ceased; there was now another way of satisfying the desires of ambitious men, namely, by courting the favour of the emperor. After the final reduction of the Spaniards, therefore, and the conquests of the countries of Mæsia, Pannonia, and some others adjacent to the Roman territories, and which in a manner seemed naturally to belong to them, the empire enjoyed for some time a profound peace.

The only remarkable transactions which took place during the remainder of the period of which we treat, were the conquest of Britain by Claudius and Agricola, and the destruction of Jerusalem by Vespasian and Titus. The war with the Jews began A. D. 67, and was occasioned by their obstinately claiming the city of Cæsarea, which the Romans had added to the province of Syria. It ended with the destruction of their city and nation, in 73; and since that time they have never been able to assemble as a distinct people. The southern parts of Britain were totally subdued by Agricola about ten years afterwards.

In the 98th year of the Christian era, Trajan was created emperor of Rome; and being a man of great valour and experience in war, he carried the Roman conquests to their utmost extent. Having conquered the Dacians, a German nation beyond the Danube, who had proved extremely troublesome, he turned his arms eastward; reduced all Mesopotamia, Chaldæa, and Assyria; and having taken Ctesiphon, the capital of the Parthian empire, appointed a king, which he thought would be a proper method of keeping the warlike population in subjection. After this he proposed to return to Italy, but died by the way; and with his reign the seventh general period above mentioned concluded.

Eig period

The beginning of the eighth period presents us with a view of one vast empire, in which almost all the nations of the world as then known were swallowed up. This empire comprehended the best part of Britain, all Spain, France, the Netherlands, Italy, part of Germany, Egypt, Barbary, Bildulgerid, Turkey in Europe, Turkey in Asia, and Persia. The state of India was at this time nearly unknown. The Chinese lived in a remote part of the world, unheard of and unmolested by the western nations who struggled for the empire of the world. The northern parts of Europe and Asia were filled with barbarous nations, already formidable to the Romans, and who were destined soon to become more so. The vast empire of Rome, however, had no sooner attained its utmost degree of power, than, like those which had preceded it, it began to decline. The provinces of Babylonia, Mesopotamia, and Assyria almost instantly revolted, and were abandoned by Hadrian, the successor of Trajan in the empire. The Parthians having recovered their liberty, proved formidable enemies, and the barbarians of the northern parts of Europe continued to increase in strength; whilst the Romans, weakened by intestine divisions, became daily less able to resist them. At different times, however, some warlike emperors arose, who put a stop to the incursions of these barbarians; and, about the year 215, the Parthian empire was totally overthrown by the Persians, who had long been subject to it. But this revolution proved of little advantage to the Romans. The Persians were enemies still more troublesome than the Parthians had been; and though often defeated, they still continued to infest the empire on the east, as the barbarous nations of Europe did on the north. In the year 260, the defeat and captivity of the Emperor Valerian by the Persians, with the disturbances which followed, threatened the empire with utter destruction. Thirty tyrants seized the government at once, and the barbarians pouring in on all sides in prodigious numbers, ravaged almost all the provinces of the empire. By the vigorous conduct of Claudius, Aurelian, Tacitus, Probus, and Carus, the empire was restored to its former lustre; but as the barbarians were only repulsed, and never thoroughly subdued, this proved merely a temporary relief; and, what was worse, the Roman soldiers, growing impatient of all restraint, commonly murdered those emperors who attempted to revive the ancient military discipline, which alone could insure victory. Under Diocletian the disorders were so great, that, though the government was held by two persons, they found themselves unable to bear the weight of it, and therefore assumed two other partners in the empire. Thus was the Roman empire divided into four parts; a division which is considered by all historians to have been productive of the greatest evils. For as each of these four sovereigns had as many officers, both civil and military, and the same number of forces which had been maintained by the state when governed only by one emperor, the people were unable to pay the sums necessary for supporting them. Hence the taxes and imposts were increased beyond measure, the inhabitants in several provinces were reduced to beggary, and the land was left untilled for want of labourers. An end was put to these evils when the empire was again united under Constantine the Great; but in 330 a mortal blow was given to it by removing the imperial seat to Byzantium, now Constantinople, and making it co-ordinate with Rome. The introduction and establishment of Christianity, already corrupted with the grossest superstitions, proved also a grievous detriment to the empire. Instead of that steady and obstinate valour in which the Romans had so long been accustomed to put their trust, they now imagined themselves secured by signs of the Cross, and other external symbols of the Christian religion, which they used as a kind of magical incantations; and hence proceeded in some measure the great revolution which took place in the next period.

Ninth period.

The ninth general period includes the decline and fall of the western empire. That empire, which formerly occupied almost the whole world, was now weakened by division and surrounded by enemies. On the east the Persians, on the north the Scythians, Sarmatians, Goths, and other barbarous nations, watched all occasions to break into it; and though they miscarried in their attempts, this was owing more to their own barbarity than to the strength of their enemies. The devastations committed by these barbarians, when they made their incursions, are incredible in themselves, and the relation is shocking to human nature. Some authors seem much inclined to favour them, and even to insinuate that barbarity and ignorant ferocity were their chief, if not their only defects. But from their history it appears, that not only barbarity and the most shocking cruelty, but the highest degree of avarice, perfidy, and disregard to the most solemn promises, were to be numbered amongst their vices. It was ever a sufficient reason for them to make an attack, that they thought their enemies could not resist them. Their only reason for making peace, or for keeping it when made, was because their enemies were too strong; and if they gained a victory, this was, in their estimation, sufficient to justify the most horrid massacres, rapes, and all manner of crimes. The Romans, degenerate as they had become, were yet esteemed much better than these savages; and therefore we find that not a single province of the empire would submit to the barbarians whilst the Romans could possibly defend it.

Some of the Roman emperors indeed withstood this inundation of savages; but as the latter grew daily more numerous, and the Romans continued to weaken themselves by their intestine divisions, they were at last obliged to take large bodies of barbarians into their pay, and to teach them military discipline, in order to drive away their countrymen, or others who had invaded the empire. This policy at last proved its total destruction. In 476, the barbarians who had served in the Roman armies, and were dignified with the title of "allies," demanded the third part of the lands of Italy as the reward of their services; but meeting with a refusal, they revolted, and made themselves masters of the whole country, and of Rome itself, which from that time ceased to be even nominally the head of an empire.

This period exhibits a most unfavourable view of the western parts of the world. The Romans, from the height of grandeur, had sunk to the lowest slavery, and in fact were almost exterminated; the provinces which they formerly governed were inhabited by human beings scarcely a degree above the brutes; every art, every science, was lost; and the savage conquerors were even in danger of starving for want of a sufficient knowledge of agriculture, having now no longer the means of supplying themselves by plunder and robbery. Britain had long been abandoned to the mercy of the Scots and the Picts; and in 450 the inhabitants had called to their assistance the Saxons, whom they soon found worse enemies than those against whom they had implored their aid. Spain was held by the Goths and Suevians; Africa, that is, Barbary and Bildulgerid, was occupied by the Vandals; the Burgundians, Goths, Franks, and Alans, had erected several small states in Gaul; and Italy was subjected to the Heruli under Odoacer, who had assumed the title of king of Italy. In the East, indeed, matters wore an aspect somewhat more favourable. The Roman empire continued to live in that of Constantinople, which was still extensive. It comprehended all Asia Minor and Syria, as far as Persia; in Africa, the kingdom of Egypt; and in Europe the territory of Greece. The Persians were powerful, and rivalled the emperors of Constantinople; and beyond them lay the Indians, Chinese, and other nations, who, unheard of by the inhabitants of the more western parts, enjoyed unmolested peace and liberty.

The Constantinopolitan empire continued to decline by reason of the continual wars in which it was engaged with the Persians, Bulgarians, and other barbarous nations; and to this also superstition and relaxation of military discipline largely contributed. The Persian empire likewise declined from similar causes, together with the intestine broils, from which it was seldom free. The history of the eastern part of the world during this period, therefore, consists only of the wars between the two empires, which were productive of no other consequence than that of weakening both, and rendering them a more easy prey to those enemies who were ere long to erect an empire almost as extensive as that of the Greeks or Romans.

Amongst the western nations, revolutions succeeded one another with unprecedented rapidity. The Heruli under Odoacer were driven out by the Goths under Theodoric. The Goths again were expelled by the Romans; and, whilst the two parties were contending, both were attacked by the Franks, who carried off an immense booty. The Romans were in their turn expelled by the Goths. The Franks again invaded Italy, and made themselves masters of the province of Venetia; but at last the superior fortune of the emperor of Constantinople prevailed, and the Goths were finally subdued in 553. Narses, the conqueror of the Goths, governed Italy as a province of the eastern empire till the year 568, when Longinus his successor made considerable alterations. The Italian provinces had, ever since the time of Constantine the Great, been governed by *consulares*, *correctores*, and *præsides*, no alteration having been made either by the Roman emperors, or even by the Gothic kings. But Longinus, being invested with absolute power by Justinian, suppressed these magistrates, and, instead of them, placed in each city of note a governor, whom he distinguished with the title of *duke*. The city of Rome was not more honoured than any other; for Longinus, having abolished the very name of senate and consuls, appointed a duke of Rome as well as of other cities. For himself he reserved the title of *exarch;* and as he resided at Ravenna, his government was styled the exarchate of Ravenna. But whilst he was establishing this new empire, the greater part of Italy was conquered by the Lombards.

In France a considerable revolution also took place. In 487, Clovis, the founder of the French monarchy, possessed himself of all the countries situated between the Rhine and the Loire; and, by force or treachery, he conquered all the petty kingdoms which had been erected in that country. His dominions had been divided, united, and divided again; and were on the point of being again united, when the followers of Mahommed began to make a figure in the world, and to threaten all the countries of the West.

In Spain, the Visigoths had erected a kingdom ten years before the conquest of Rome by the Heruli. This kingdom they had extended to the eastward, about the same time that Clovis was extending his conquests to the westward; so that the two kingdoms were separated only by the Loire. The consequence of this approximation was an immediate war. But Clovis proved victorious, and, having subdued the greater part of the country of the Visigoths, put a final stop to their conquests on that side.

Another kingdom had been founded in the western part of Spain by the Suevi, a considerable time before the Romans were finally expelled from that country. But in 409 this kingdom was entirely subverted by Theodoric king of the Goths; and the Suevi were so pent up in a small district of Lusitania and Galicia, that it seemed impossible for them ever to recover the ground they had lost. During the above-mentioned period, however, whilst the attention of the Goths was turned another way, they found means again to erect themselves into an independent state, and to become masters of considerably extended territories. But this success proved of short duration. In 584 the Goths attacked them, and having totally destroyed their power, became masters of all Spain, excepting a small part which still owned subjection to the emperors of Constantinople. Of this part, however, the Goths also possessed themselves in the year 623, which concludes the ninth general period.

Africa, properly so called, had changed masters three times during this period. The Vandals had expelled the Romans, and erected an independent kingdom, which was at length overturned by the emperors of Constantinople; and from them the greater part of it was taken by the Goths in the year 620.

Tenth riod.

At the commencement of the tenth general period, which begins with the flight of Mahommed in the year 622, whence his followers date their era called the *Hejira*, we see every thing prepared for the great revolution which was now about to take place. The Roman empire in the west was annihilated; the Persian empire and that of Constantinople were weakened by mutual wars and intestine divisions; the Indians and other eastern nations, unaccustomed to war, were ready to fall a prey to the first invader; and the southern parts of Europe were in a distracted and barbarous state; whilst the inhabitants of Arabia, from their earliest origin accustomed to war and plunder, and now united by the most fanatical superstition and enthusiastic desire of conquest, were, like a pent-up flood, ready to overwhelm the rest of the world. The northern nations of Europe and Asia, which became so formidable in after times, were at present unknown to their southern neighbours; and in no quarter of the globe was there any power capable of opposing the conquests of the Arabs. With amazing celerity, therefore, they overran all Syria, Palestine, Persia, Bukharia, and India, extending their conquests farther to the eastward than Alexander, and carrying all before them. In the west, their empire extended over Egypt, Barbary, and Spain, together with the islands of Sicily, Sardinia, Majorca, Minorca, and the islands of the Archipelago; nor were the coasts of Italy itself free from their incursions, which are even said to have reached as far as Iceland. But at last this great empire began, like others, to decline. Its ruin was sudden, and mainly owing to its internal divisions. Mahommed had not taken care to establish the apostleship in his family, or to give any particular directions about a successor. The consequence of this was, that the caliphate, or succession to the Prophet, was seized by many usurpers in different parts of the empire; whilst the true caliphs, who resided at Bagdad, gradually lost all power, and were regarded only as a kind of high priests. Of these divisions the Turks took advantage to establish their authority in many provinces of the Mahommedan empire; but as they embraced the same religion with the Arabs, and were filled with the same enthusiastic desire of conquest, it is of little consequence to distinguish between them, for it signified nothing to the world whether the Turks or Saracens were the conquerors, since both were equally cruel, barbarous, ignorant, and superstitious.

Whilst the barbarians of the East were thus grasping at the empire of the world, great disturbances happened amongst the hardly less barbarous nations of the West. Superstition seems to have been the ruling principle in both cases. The Saracens and Turks conquered for the glory of God, or of his prophet Mahommed and his successors; the western nations professed an equal regard for the divine glory, which, however, was only to be perceived in the respect they paid to the pope and the clergy. Ever since the establishment of Christianity by Constantine, the bishops of Rome had been gradually extending their power, and attempting not only to render themselves independent, but even to assume an authority over the emperors themselves. The destruction of the empire was so far from weakening their power, that it afforded them opportunities of greatly extending it, and becoming judges of the sovereigns of Italy themselves, whose barbarity and ignorance prompted them to submit to their decisions. During all this time, however, they themselves had been in subjection to the emperors of Constantinople; but upon the decline of that empire, they found means to get themselves exempted from this subjection. The principal authority in the city of Rome was then engrossed by the bishop, though of right it belonged to the duke appointed by the exarch of Ravenna. But though they had now little to fear from the eastern emperors, they were in great danger from the ambition of the Lombards, who aimed at the conquest of all Italy. This aspiring people the bishops of Rome determined to check; and therefore, in 726, when Luitprand king of the Lombards had taken Ravenna and expelled the exarch, the pope undertook to restore the latter. For this purpose he applied to the Venetians, who are now first mentioned in history as a state of any consequence; and by their means the exarch was restored. Some time before this a quarrel had taken place between the pope, Gregory II., and Leo, emperor of the East, about the worship of images. Leo, who in the midst of so much barbarism had still preserved some share of common sense and reason, reprobated in the strongest terms the worship of images, and commanded them to be destroyed throughout his dominions. But the pope, whose cause was favoured by the most absurd superstitions, and by these alone, refused to obey the emperor's commands. The exarch of Ravenna, as a subject of the emperor, was ordered to force the pope to yield a compliance, and even to seize or assassinate him in the event of a refusal. This excited the pious zeal of Luitprand to assist the pope, whom he had formerly designed to subdue. The exarch was first excommunicated, and then torn in pieces by the enraged multitude; the duke of Naples shared the same fate; a vast number of the *Iconoclasts*, or Image-breakers, as they were called, were slaughtered without mercy; and, to complete all, the subjects of the exarchate, at the instigation of the pope, renounced their allegiance to the emperor.

Leo was no sooner informed of this revolt than he ordered a powerful army to be raised, in order to reduce the rebels, and to take vengeance on the pope. Alarmed at these warlike preparations, Gregory looked round for some power upon which he might depend for protection. The Lombards were possessed of sufficient force, but they were too near and too dangerous neighbours to be trusted; the Venetians, though zealous Catholics, were as yet unable to withstand the force of the empire; and Spain was overrun by the Saracens. The French seemed, therefore, the only people to whom it was advisable to apply for aid, as they were able to oppose the emperor, and were likewise enemies to his edict. Charles Martel, who at that time governed France as mayor of the palace, was therefore applied to; but before a treaty could be concluded, all the parties concerned were removed by death. Constantine Copronymus, who succeeded Leo at Constantinople, not only persisted in the opposition to image-worship begun by his predecessor, but also prohibited the invocation of saints. Zachary, who succeeded Gregory III. in the pontificate, proved as zealous an adversary as his predecessor. Pepin, who succeeded Charles Martel in the sovereignty of France, proved as powerful a friend to the pope as his father had been. The people of Rome had nothing to fear from Constantinople, and therefore drove out all the emperor's officers. The Lombards, awed by the power of France, for some time allowed the pope to govern in peace the dominions of the exarchate; but in 752, Astolphus king of Lombardy not only reduced the greater part of the pope's territories, but threatened the city of Rome itself. Upon this an application was made to Pepin, who obliged Astolphus to restore the places he had taken, and gave them to the pope, or, as he said, to St Peter. The Greek emperor, to whom they of right belonged, remonstrated to no purpose. The pope from that time became possessed of considerable territories in Italy, which, from the manner of their donation, go under the name of the Patrimony of St Peter. It was not, however, before the year 774 that the pope was fully secured in these new dominions. This was accomplished when the kingdom of the Lombards was totally destroyed by Charlemagne, who was then crowned king of Italy. Soon after this, that monarch made himself master of all the Low Countries, Germany, and part of Hungary; and in the year 800 he was solemnly crowned by the pope, Emperor of the West.

Thus the world was once more divided into three great empires. That of the Arabs or Saracens extended from the river Ganges to Spain, comprehending almost all those parts of Asia and Africa which were known to Europeans, except the kingdoms of China and Japan. The eastern Roman empire was reduced to Greece, Asia Minor, and the provinces adjoining to Italy. The empire of the West, under Charlemagne, comprehended France, Germany, and the greater part of Italy. The Saxons, however, as yet possessed Britain unmolested by external enemies, though the seven kingdoms erected by them were engaged in perpetual contests. The Venetians also enjoyed a nominal independence, though their situation rendered them dependent upon the great powers which surrounded them. But of all the European potentates, the popes certainly exercised the greatest authority; for even Charlemagne himself condescended to accept the crown from their hands, and his successors made them the arbitrators of their differences.

Matters, however, did not long continue in this state. The empire of Charlemagne, upon the death of his son Louis, was divided amongst his three children. Endless disputes and wars ensued, till at last the sovereign power was seized by Hugh Capet in 987. The Saxon heptarchy was dissolved in 827, and the whole of England reduced under one head. The Danes and Normans now began to make depredations, and to infest the neighbouring states. The former conquered the English Saxons, and seized the government, but were in their turn expelled by the Normans in 1066. In Germany and Italy great disturbances arose out of the disputes between the popes and the emperors; and, if to all this we add the internal contests which sprung from the ambition of the powerful barons of every kingdom, some idea may be formed of these calamitous times. All Europe, nay, all the world, was one great field of battle; for the empire of the Mahommedans was not in a more settled state than that of the Europeans. Caliphs, sultans, emirs, and others, waged continual war in every quarter; new sovereignties every day sprung up, and were as quickly destroyed. In short, through the ignorance and barbarity with which the world was then overspread, it seemed in a manner impossible that the human race could long continue to exist; when happily the crusades, by directing the attention of the Europeans to a foreign object, forced them to suspend their domestic feuds.

Eleventh period.

The Crusades originated in the superstition of the two grand parties into which the world was at that time divided, namely, the Christians and Mahommedans. Both looked upon the small territory of Palestine, which they denominated the Holy Land, as an invaluable acquisition, for which no sum of money could be any equivalent; and both took the most unjustifiable methods to accomplish their objects. The superstition of Omar, the second caliph, had prompted him to invade this country, part of the territories of the Greek emperor, who had done him no injury; and now, when it had been so long under the subjection of the Mahommedans, a similar superstition prompted the pope to send an army for the recovery of Palestine. The crusaders accordingly poured forth in multitudes, like those with which the kings of Persia formerly invaded Greece; and their fate was in some respects similar. At first, indeed, their impetuous valour carried every thing before them, and they recovered all Palestine, Phœnicia, and part of Syria, from the infidels; but their want of skill soon lost what their valour had obtained, and very few of the vast multitudes which had left Europe ever revisited their native lands. A second, a third, and other crusades, were preached, and attended with like success in both respects. Vast numbers took the cross, and repaired to the Holy Land, which they polluted with the most abominable massacres and treacheries, and from which very few of them ever returned. In the third crusade embarked Richard I. of England, who seems to have been the best general that ever went into the East; but even his valour and skill were not sufficient to repair the faults of his companions, and he was obliged to return after having entirely defeated his antagonists, and been within sight of Jerusalem. See the article CRUSADES.

But whilst the Christians and Mahommedans were thus surreptitiously contending for a small territory in the western parts of Asia, the nations in the more easterly parts were threatened with total extermination. Genghiz Khan, the greatest as well as the most bloody conqueror that ever existed, now made his appearance. The rapidity of his conquests seemed to emulate those of Alexander the Great, and the cruelties which he committed were altogether unparalleled. It is worth observing, that Genghiz Khan and all his followers were neither Christians nor Mahommedans, but strict deists. For a long time even the sovereign had not heard of a temple, nor of any particular place on earth appropriated by the Deity to himself, and treated the notion with ridicule when it was first mentioned to him.

The Moguls, over whom Genghiz Khan assumed the sovereignty, were a people of Eastern Tartary, divided into a great number of petty governments, as they are at this day, but who owned subjection to one sovereign, whom they called *Vang Khan*, or the Great Khan. Temujin, afterwards Genghiz Khan, was one of these petty princes; but being unjustly deprived of the greater part of his inheritance at the age of thirteen, he could not recover it till he arrived at that of forty. This corresponds with the year 1201, when he totally reduced the rebels, and, as a specimen of his lenity, caused seventy of their chiefs to be thrown into as many caldrons of boiling water. In 1202 he defeated and killed Vang Khan himself, known to the Europeans by the name of *Prester John of Asia*; and possessing himself of his vast dominions, became thenceforth altogether irresistible. In 1206, having still continued to enlarge his dominions, he was declared khan of the Moguls and Tartars, and took upon him the title of *Genghiz Khan*, or *The Great Khan of Khans*. This was followed by the reduction of the kingdom of Hya in China, Tangut, Kitay, Turkestan, Karazm (the kingdom of Gazna, founded by Mahmud Gazni), Great Bukharia, Persia, and part of India; all of which vast regions were reduced in twenty-six years. The devastations and slaughters with which these conquests were accomplished are unparalleled, no fewer than 14,470,000 persons being computed to have been massacred by Genghiz Khan during the last twenty-two years of his reign. In the beginning of 1227 he died, thereby freeing the world from a most bloody tyrant. His successors completed the conquest of China and Korea, but were foiled in their attempts on Cochin-China, Tong-king, and Japan. On the western side the Tartar dominions were not much enlarged till the time of Hulaku, who conquered Media, Babylonia, Mesopotamia, Assyria, Syria, Georgia, Armenia, and almost all Asia Minor; putting an end to the empire of the Saracens by the taking of Bagdad in 1258.

The empire of Genghiz Khan shared the fate of all others. Being far too extensive to be governed by one head, it split into a multitude of small kingdoms, such as had existed before his time. All the princes of these, however, owned allegiance to the family of Genghiz Khan till the time of Timur Beg, or Tamerlane. The Turks, in the mean time, urged forward by the inundation of Tartars, who poured in from the East, were forced upon the remains of the Greek empire; and, at the time of Tamerlane above mentioned, they had almost confined this once mighty empire within the walls of Constantinople.

In the year 1335 the family of Genghiz Khan having become extinct in Persia, a long civil war ensued, during which Timur Beg, one of the petty princes among whom the Tartar dominions were divided, found means to aggrandise himself in a manner similar to that in which Genghiz Khan had done about a hundred and fifty years before. Genghiz Khan, indeed, was the model whom he proposed to imitate; but it must be allowed that Timur was more merciful, if indeed the word can be applied to such inhuman tyrants. The plan on which Genghiz Khan had conducted his expeditions was that of total extermination. For some time he utterly extirpated the inhabitants of those places which he conquered, designing to people them anew with his Moguls; and, in consequence of this resolution, he employed his army in beheading a hundred thousand prisoners at once. Timur's cruelty, on the other hand, seldom went farther than the pounding of three or four thousand people in large mortars, or building them amongst bricks and mortar into a wall. We must observe, however, that Timur was not a deist, but a Mahommedan, and conquered expressly for the purpose of spreading the Mahommedan religion; for the Moguls had now adopted all the superstitions and absurdities of Islamism. Thus the eastern part of the world was threatened anew with the most dreadful devastations, whilst the western nations were exhausting themselves in fruitless attempts to recover the Holy Land. The Turks were the only people who seem at this period to have been gathering strength, and who, by their perpetual encroachments, threatened to swallow up the western nations, as the Tartars had done those of the East.

In 1362 Timur invaded Bukharia, which he reduced in five years, and proceeded in his conquests, though not with the same celerity as Genghiz Khan, till the year 1387, when he had subdued all Persia, Armenia, Georgia, Karazm, and the greater part of Tartary. After this he advanced westward, subduing all the countries as far as the Euphrates, made himself master of Bagdad, and even entered Russia, where he pillaged the city of Moscow. He then turned his arms to the East, and totally subdued India. In 1393 he invaded and reduced Syria; and having turned his arms against the Turks, he forced their sultan Bajazet to raise the siege of Constantinople. This brought on an engagement, in which Bajazet was entirely defeated and taken prisoner; an event which so broke the power of the Turks, that they were not for some time able to recover themselves. At last this great conqueror died in the year 1405, whilst on his way to conquer China, as Genghiz Khan had done before him.

The death of Timur was followed almost immediately by the dissolution of his empire, and most of the nations which he had conquered recovered their liberty. The Turks had now no further obstacle to their conquest of Constantinople. The western nations having exhausted themselves in the Holy Wars, as they were called, had now lost that insatiable thirst of conquest which so long possessed the minds of men. They had already made considerable advances in civilization, and begun to study the arts of peace. Gunpowder was invented, and its application to the purposes of war already known; and, although no invention threatened to be more destructive, perhaps none has ever proved more beneficial to the human race. By the use of fire-arms, nations are placed more on a level than they formerly were; and war is reduced to a regular system, which must be studied with as much care as any other science. Conquests are not now to be made with the same ease as formerly; the defensive force of states has been increased; and hence latterly the world has been much more peaceable and tranquil than in former ages. In 1453 the conquest of Constantinople by the Turks fixed that wandering people to one place; and though they long possessed extensive dominions in Europe, in Asia, and in Africa, an effectual stop has long been put to their further progress, and their power is now rapidly declining.

About this time, also, learning began to revive in Europe, where it had long been lost; and the invention of printing, which happened about the same time, rendered it in a manner impossible for barbarism ever again to recover its ancient empire. All the nations of the world, indeed, seem now to have laid aside much of their former ferocity; and, although wars have been by no means uncommon, these have not been carried on with such circumstances of atrocity and cruelty as before. Instead of attempting to enrich themselves by the spoils of their neighbours, mankind have in general applied themselves to commerce, the only true and durable source of riches. This soon produced improvements in navigation, which again led to the discovery of many regions formerly unknown. At the same time, the European powers, being at last thoroughly sensible that extensive conquests could never be permanent, applied themselves rather to provide for the security of the dominions which they already possessed, than to attempt the conquest of one another; and this produced the policy to which so much attention was subsequently paid, namely, that of preserving the balance of power in Europe, or preventing any one nation from acquiring sufficient strength to overpower another.

In the end of the fifteenth century the vast continent of America was discovered; and, almost at the same time, Vasco de Gama opened the passage to the East Indies by the Cape of Good Hope. The discovery of these new regions gave a new turn to the ambition of the Europeans. To enrich themselves by the gold and silver produced in these countries, or by traffic with the natives, now became the object of the more adventurous and enterprising. The Portuguese had the advantage of being the first discoverers of the countries in the eastern, and the Spaniards in the western hemisphere. Nor did the former neglect so favourable an opportunity of enriching themselves by commerce. Many settlements were formed by them in the East India islands, and on the continent; but their avarice and perfidious behaviour towards the natives proved at last the cause of their total expulsion. The Spaniards enriched themselves by the vast quantities of the precious metals imported from America, but which were only obtained by the most horrid massacres committed on the natives. The possessions of the Spaniards and Portuguese soon excited other European nations to make attempts to share with them in their treasures, by planting colonies in different parts of America, and effecting settlements in the East Indies; and thus the rage of war was in some measure transferred from Europe to these distant regions, whilst, after various contests, the British at last obtained a great superiority both in America and the East Indies.

The revolutions which took place in Europe during this period were, some of them, productive of important results. The total expulsion of the Moors and Saracens from Spain followed the capture of Granada in 1491. The fall of their capital terminated the long struggle which they had maintained to preserve a footing in the country to which they were so much attached; and the barbarous act which consummated their overthrow (an act highly characteristic of the age, though equally at variance with sound policy and common humanity) recoiled on the victorious perpetrators, by annihilating art, destroying industry, and extinguishing the light of science in the Peninsula. Spain felt severely the shock occasioned by the expulsion of this people, amongst whom knowledge and refinement had made considerable advances; but, on the other hand, the union of Aragon and Castille by the marriage of Ferdinand and Isabella formed the first step towards the consolidation under one monarchy, of the different petty kingdoms into which the country was divided, and laid the foundation of that power and ascendency which, in less than a century, Spain acquired amongst the nations of Europe. Her advancement was rapid, and, in the brilliant reign of Charles V., she reached the zenith of her glory. But at this culminating point of splendour and power she was not destined to remain, even for a short period, stationary; for the sun of her glory, having passed his meridian, began immediately to decline in the quarter opposite to that in which he had arisen. Philip, the son and successor of the emperor, unable to wield the power which had been committed to his hands, misgave in all his enterprises; and whilst the spirit of the nation was humbled by his reverses, its resources were exhausted by the obstinate but ill-directed efforts made to repair them. The blow, however, which fell most heavily on the power of Spain was the revolt of the states of Holland. The Dutch, animated by that spirit of liberty which commerce always inspires, and driven to despair by a ruthless and implacable despotism, which attempted to impose its fetters on the mind as well as the body, rose in arms against their oppressors, and, after a sanguinary struggle, most unequal in its commencement but glorious in its results, they conquered their independence, and were, in the year 1609, declared a free people. Thus Spain lost the brightest jewel in its crown, freedom gained a new ally, and the despots of Europe were taught the important lesson that nothing is impossible for a brave people who have resolved, at all hazards, to establish their liberty.

In Asia nothing of importance had occurred since the capture of Constantinople by the Turks. Comparative tranquillity reigned throughout that vast continent, which had so often been the theatre of violent revolutions, sudden conquests, and mushroom empires. Siberia had fallen under the dominion of Russia. To the southward, from Asia Minor to China and Corea, the Tartars roamed through their inhospitable deserts, formidable, indeed, by their numbers, but, from their disunion and barbarism, no longer capable of pouring in overwhelming masses on the nations of the East or of the West. The Turks possessed the western part of the continent, or Asia Minor, as far as the river Euphrates, which formed their boundary on the east. The Arabs were again confined within their own peninsula, which they possessed, as they had ever done, without owning subjection to any foreign power, in a state of wild independence. Contiguous to Turkey on the east lay Persia, now more restricted in its limits than before, but still powerful; whilst India, destined ere long to change masters, and yield to the supremacy of European arts and arms, slumbered under the dominion of the Mogul. Of the countries still farther to the east little was as yet known to the nations of the west; but an era of more active enterprise and daring adventure was rapidly approaching. The vast empire of China, occupying the most easterly portion of the Asiatic continent, enjoyed, as before, an almost entire immunity from revolution, or, if visited by a Tartar inroad, soon absorbed the invaders into its own vast mass, without the least disturbance to its laws, its institutions, or its government, or any other change than that of a dynasty or a name.

In Africa, the Turks possessed Egypt, which they had conquered in 1517, though by a very insecure tenure, and exercised a sort of nominal jurisdiction over the Barbary states, the principal of which, Algiers, has at length been subdued and converted into a troublesome colonial dependency of France. Of the barbarous nations who occupied the interior little or nothing was as yet known. On the western coast the British and Portuguese had established settlements; and the southern extremity was occupied by the Dutch, who were at length dispossessed by the British, when the latter found it necessary, for the security of their power in India, to occupy that advanced position in the Southern Ocean. The eastern coasts remained almost wholly unknown; whilst the Asiatic and African islands were either possessed by Europeans, or inhabited by savage tribes.

The European nations, at the beginning of the seventeenth century, were Britain, France, Holland, Spain, Portugal, Italy, Turkey in Europe, and in the north and east Germany, Poland, Russia, Sweden, and Denmark. Of these, Russia, though the most barbarous, was nevertheless, in point of territory and population, by far the most considerable; but the situation of that power, at a distance from the centre of European policy and civilization, the poverty of its resources, the unsettled nature of its government, the rude and sluggish character of its population, immersed in profound ignorance and grovelling superstition, and, above all, its state of political isolation, rendered it in no respect formidable to other nations, and, in fact, made it be, in a great measure, overlooked in adjusting the balance of power in Europe. The kingdom of Poland, which had existed for upwards of six centuries, proved a barrier between Russia and Germany; it formed, as it were, the frontier defence of the nations of the south and west of Europe, to which it was naturally allied by a community of civilization, against the inroads of the northern barbarians, its immediate and natural enemies; it seemed established by Providence, in short, as a powerful advanced guard for the protection of Central Europe on the side where it was weakest and most easily assailable. As long, therefore, as the necessity of maintaining a balance of power entered into the calculations of cabinets, it might have been supposed, that, whatever wars Europe might be engaged in, and whatever changes of territory might in consequence be effected, the most obvious views of interest, of policy, and even of self-defence, would have recommended the preservation of a kingdom, which, both from its peculiar situation, and from the high and chivalrous character of its people, formed, or at least should have formed, an important element in the European system. So far from this, however, Poland was first dismembered, and afterwards destroyed. Whilst the cupidity of Austria and Prussia was appeased by a share of the spoil, Russia attained the first object of her ambition by the removal of the grand obstacle which had hitherto prevented her from interfering in the affairs of the Continent; the equilibrium of power was entirely destroyed; and the other nations of Europe tamely acquiesced in a change of system, all the consequences of which have not yet been foreseen. The immediate results of this great public crime are matters of universal notoriety. Russia, elevated at once to the rank of a first-rate power, has attained an ascendency in continental affairs, and, by means of systematic encroachments, has at length so completely humbled Turkey, that the period is not very distant when she will attempt to transfer the seat of her empire from Petersburg to Constantinople. Her ambitious designs were all along of the most grasping and comprehensive character; but as these were slowly and cautiously developed, at times and seasons most favourable for their advancement, her artful and insidious policy excited no suspicion or alarm until it was almost too late to check, far less to arrest, her career. It remains to be seen how far the other powers of Europe may yet have cause to regret the passive indifference with which they so long regarded the progressive aggrandisement of an empire, which already seems to aim at universal dominion, and the influence of which is now felt from the Indus to the Bosphorus.

The wars of the eighteenth century were not productive of any great or memorable changes, until the successful revolt of the British colonies in North America issued in the establishment of their independence. This important event, which gave birth to a kindred nation on the other side of the Atlantic, and laid the foundation of liberty in the New World, was generally regarded by the enemies of Britain as a fatal shock to her power and wonted superiority; and France, in assisting the colonies to conquer their independence, no doubt imagined that she was contributing in the most effectual manner to humble her ancient and formidable rival. But the result has shown that all such expectations were founded on error. The colonies, it is true, were disjoined from the mother country, and formed into an independent nation, which is now advancing with rapid strides in wealth, in power, and in greatness, and which is certainly destined, at no very distant date, to form one of the mightiest communities of freemen on the face of the earth. But Great Britain has had no cause to lament the separation, or to repine at their prosperity. Divested only of a splendid encumbrance, an expensive and invidious appanage, she has been left at liberty to reap the undivided benefits of her native vigour, to display new energies, to extend her industry and enterprise, and, in the profits of an active commerce with a great and rising nation, to indemnify herself for the barren distinction of maintaining unproductive establishments beyond the Atlantic. The separation, in fact, has proved equally advantageous to both parties. To America it formed the commencement of a career of prosperity unexampled in the history of nations, and of which it is yet impossible to foresee the full development; whilst Britain, relieved from a burden that exhausted her strength and crippled her vigour, started with fresh vigour in the race of improvement, and rose rapidly in greatness and power after the event which shortsighted politicians had considered as the forerunner of her humiliation and decay. Every addition made to the great community of free nations is in fact a common benefit to all.

On the other hand, the flame which, it was thought, would scorch Britain, soon blazed out with consuming violence in the bosom of her principal foe. The course of time, and, above all, the accumulated evils of ages of tyranny and misgovernment, had long been silently preparing in France those combustible elements which sooner or later explode in political convulsions. In the old system there was no self-correcting or regenerative principle; despotism can never stop short in its career, far less retrace its steps; its character is to persevere, its progress is from bad to worse. It is only by passing through a course of revolution, perhaps through anarchy, that long-lost liberty can be recovered, and the dominion of equal laws established; and to this transition every thing now tended in France. All the props of the old system were either undermined or decayed; the state of opinion and knowledge had prodigiously outrun a government which existed only on the recollections of the past; religion, having degenerated into superstition, had lost its hold on the public mind; free discussion had given rise to a new set of opinions, and bold doctrines were boldly promulgated; the decay of the finances weakened the power of the state, and whilst the country groaned under every sort of abuse, odious privileges inflamed the resentment of the people. In short, a crisis of the most tremendous description was evidently preparing; and it is probable enough that those who had served an apprenticeship to liberty in America, were not backward, on their return to their own country, in endeavouring to set up for themselves. Be this as it may, however, the crisis arrived even more speedily than could have been expected, and a constitution, extorted from the court, was at first thankfully received by the nation. But it is not of the nature of such political revulsions to stop short with a partial success. The re-action was too violent to be arrested after the first recoil, and soon swept away those who had vainly attempted to control and regulate it. The monarchy was overthrown, and in its fall dragged down the degenerate and corrupt church on which it had leaned for support. Anarchy for a season reigned in tumultuous and sanguinary supremacy. The prisons were crowded with victims, the scaffolds were drenched with gore. But victory declared in favour of the republic; and whilst torn by the violence of faction within, her arms were triumphant on the frontiers, and latterly both Germany and Italy were humbled at the feet of a government, the offspring of anarchy and revolution. Prussia, after suffering severe humiliation, withdrew early from the contest with France, to repair the injuries she had sustained, and brook in silence her disgrace. Austria, stimulated by British counsels, and subsidised by British gold, persisted longer, but was ultimately compelled, by the advance of a victorious army within a few marches of her capital, to submit to the law of the conqueror. Britain, triumphant on the ocean, still maintained an attitude of defiance; but seeing her allies struck down and humbled, she eventually concluded a peace, or at least a truce, with the new republic.

The shock produced by this contest was quite unprecedented. The impulse of the Revolution had proved irresistible, especially on the Continent. Marengo had decided the fate of Italy, which was in consequence wrenched from the grasp of Austria, whilst that power had almost simultaneously received a severe body blow at Hohenlinden. France having obtained the Rhine as her boundary, threatened Germany, and necessarily acquired an ascendency over the smaller states along the river, as well as those interposed between that limit and the hereditary dominions of Austria. Naples was effectually humbled, and the power of the pope as a temporal sovereign almost annihilated. In a word, France had become lord of the ascendant on the Continent. But the Revolution had already passed the term of its ascending movement; the fiery impulse of republicanism had nearly exhausted itself. Napoleon became the heir of all that the Revolution had created; and the consulate had superseded the directorial government, to give way in its turn to the empire. It is unnecessary to retrace here the course of events, which have been fully detailed in the articles BRITAIN and FRANCE. A military despotism was reared on the ruins of the republic, and for a time the genius and fortune of Napoleon proved irresistible. Coalition after coalition was formed under the auspices of Britain; but each in its turn was dissolved, and in its overthrow served only to aggravate the humiliation of the states of the Continent, and in the same proportion to augment the power of France. Austria was compelled to receive the law of the conqueror; Prussia, which had acted with equal faithlessness to her allies and her enemy, was at Iena almost blotted from the map of Europe; whilst Russia, defeated amidst the snows of Eylau, concluded a peace with the victor of Friedland. Soon afterwards another effort was made by Austria to check the career of the conqueror, but without success. But the doubtful advantage of Essling was effectually obliterated by the decisive victory of Wagram; and Germany was once more placed at the feet of Napoleon, to whom the vista of universal dominion now presented itself in all its illusive magnificence. This indeed was the marsh-fire which led him on to his destruction. The disastrous result of the expedition to Russia sealed his doom. The elements warred against him; and that mighty host which overwhelmed all armed opposition, being breathed upon by the frosty North, perished in the Russian deserts. All that genius and energy could achieve to repair this calamity was done, but in vain. Napoleon's hour was come, and he yielded to his destiny. Another astonishing effort to retrieve his fortunes, made in circumstances without a parallel in the history of nations, had no better success, and at Waterloo this wonderful man saw his last hope extinguished.

Thus the old monarchies of Europe, after a long and disastrous struggle, were once more victorious. They had contrived to awaken in their favour the patriotism of the people of the Continent; by promises of free constitutions, they had led, not armies, but nations, against their common enemy. In the intoxication of success, however, they forgot all the stipulations they had made during the agony of the struggle. The obligations they had come under to their people were disregarded; the division of the spoil alone occupied their attention. France saw herself reduced to her ancient limits, with an army of observation quartered on her soil. Austria recovered her ascendency in Italy; Genoa was handed over to the king of Sardinia; Saxony was dismembered to gratify the rapacity and revenge of Prussia; the third and fourth-rate states of Germany, which had accepted the alliance of France, were humbled; a new Germanic Confederation was organized under the auspices of Austria and Prussia; a shadow of independence was, with a cruel mockery, conferred on the duchy of Warsaw, a miserable remnant of what had once been the kingdom of Poland, and Russia was constituted the protectress thereof, on the same principle that the foolish shepherds intrusted the guardianship of their fold to the hypocritical but voracious wolf; and, lastly, a Holy Alliance was organized, for the purpose of repressing the slightest manifestation of a free spirit in any nation or state of the Continent. For the time, the principle of despotism was surrounded by the glare of recent triumph, enthroned amidst the shouts of victorious legions, and all-powerful for the repression of any attempt to secure the performance of those promises on the faith of which the nations had risen in arms to overthrow Napoleon. In Spain, in Naples, and in Piedmont, the constitution of the Cortes, which the allies had themselves sanctioned, was scarcely proclaimed, when the armies of the holy alliance, of France and of Austria in particular, marched to re-establish the old despotisms, and to extinguish constitutional liberty in both peninsulas.

But a short period wrought a wonderful change in the sentiments of men and in the prospects of nations. The government of Britain, which can never long act in opposition to public opinion, first withdrew from all connexion with, and ultimately declared pretty unequivocally against, the confederacy of despots formed for the extinction of liberty. A general re-action took place, and this was aided by a number of circumstances propitious to the popular cause. In South America the contest for independence continued steadily progressive, and excited deep sympathy in Europe. In Greece the sacred flame also burst forth, and, though at times nearly extinguished by the exterminating fury of the Moslemin hordes, was constantly rekindled, and fanned up afresh, until at length that glorious country, the parent of the noblest form of civilization that existed in the ancient world, has been added to the great community of free and independent nations. A new era now opened upon the world. Throughout all Europe there thrilled one common feeling in favour of liberty, accompanied by an ardent desire of political improvement. An impulse had been silently given, which nothing has yet been able to check, far less withstand, and which, we have no doubt, will ultimately overcome all opposition. Even Turkey felt its force, and, under the auspices of the successor of the Prophet himself, commenced the work of reform. In France, in Britain, in Spain, and in Portugal, the working of this spirit has been signally illustrated, and in different degrees crowned with success. Nearly contemporaneous with the third expulsion of the elder branch of the house of Bourbon from the throne of France, and the re-establishment of constitutional liberty in that country, was the great but bloodless revolution effected in Britain by the passing of the Reform Act, which, with all its defects, is one of the greatest securities for good government which this nation has ever obtained. No sooner had France disencumbered herself of the burden of an antiquated dynasty, which even the severe lessons of adversity had failed to enlighten, instruct, or amend, than Belgium, profiting by the example, cast off the yoke of Holland, and declared herself independent. In Portugal the expulsion of a cruel and perfidious usurper has been followed by the re-establishment of that constitution which he solemnly swore to maintain, and immediately thereafter trampled under foot; and Spain, under a new sovereign and an altered law of succession, though exposed to all the horrors and miseries of a civil war, continues firm in her adherence to those principles which can alone secure the social happiness and improvement of her still noble and generous people. In a word, the progressive advancement of knowledge amongst the nations is now producing its natural fruits; and though some of them are still in a state of transition, whilst in others the despotic principle continues to be an overmatch for its redoubtable antagonist; though Poland lies bleeding and lacerated in the clutches of Russia, and Germany bristles with bayonets, ready to pierce any who should dare to hoist the banners of liberty; yet there can be little doubt that the period of their deliverance is not distant, that the kingdom of Poland will ere long be reconstituted, and that grave and learned Germany will soon be free.

The principal difficulty of modern politics consists in the state of affairs in the East, or, in other words, in the peculiar relations of Russia and Turkey. The ambitious designs of the former power have long ceased to be doubtful, and, though cautiously pursued, they are in themselves of the most daring and comprehensive character. But although the weakness of the latter has been painfully exemplified, and although some errors of policy on the part of Britain and of France gave to Russia an advantage which she was not slow in profiting by, there seems to be no good ground for the apprehension and alarm which some profess to entertain upon this subject. For, besides the direct interposition of Britain and France, Egypt, which has proved under its victorious viceroy so instrumental in humbling the Porte, would, in the event of another war with Russia, become the natural and powerful ally of the Sultan; the interests of the new state of Greece would also lead the government of that country to make common cause against a power which sought to obtain an ascendency in the Mediterranean; and, what is more important than all, the boom of the first cannot-shot fired in a general war in Europe would announce to the nations the re-establishment of the kingdom of Poland. Nor is even this all. For if, as is well known, Austria already feels uneasy on account of the number of the points of contact between her dominions and those of Russia, to whose encroaching and aggrandising spirit she is no stranger, it is scarcely to be imagined that she would remain a silent spectator of any aggression which, if successful, would as it were envelope her in the coils of the great northern serpent, and enable that hideous snake to crush her at his leisure. Whilst the policy of nations is governed by a regard to their interest and their safety, these causes must continue to operate. Besides, there is a point beyond which aggression is the first step to destruction; and, in our estimation, Russia has already approximated closely, if she has not actually reached that ultimate term. Her resources are not equal to a great and sustained effort; and though her power, statistically considered, is formidable, it suffers great abatements before it can be displayed in action. This all her campaigns have illustrated; and this she has herself tacitly confessed, by trusting more to her able but insidious diplomacy than to the force of arms, which some imaginative alarmists regard as so irresistible.

II. ECCLESIASTICAL HISTORY.

The history of religion amongst the different nations of the world is a subject no less important and interesting than that of civil history. It is, however, less fertile of great events, affords an account of fewer revolutions, and is much more uniform. The reason of this is obvious. Religion is conversant about things which cannot be seen, and which consequently cannot suddenly and strongly affect the senses of mankind. The expectation of worldly riches may easily induce one nation to attack another; but it is not easy to find out any thing which will induce a nation to change its religion. The invisible nature of spiritual things, and the prejudice of habit and of early education, all stand in the way of changes of this kind. Hence revolutions in religion have been but few, and the duration of almost every religion has been of longer standing than the most celebrated empires; the changes which happened have, in general, required a long time to bring them about, and history scarcely affords an instance of the religion of any nation being essentially and suddenly changed.

With regard to the origin of religion, we must have recourse to the Scriptures, and adopt the account there given, because no other has made its appearance which seems in any degree rational, or consistent with itself. In what manner the true religion given to Adam was falsified or corrupted by his descendants before the Flood, does not clearly appear. Idolatry is not mentioned, yet we are nevertheless assured that the inhabitants of the world were then exceedingly wicked; and as their wickedness did not consist in worshipping false gods, it may be concluded that they worshipped none at all, or that the crime of the antediluvians was deism or atheism.

After the Flood, idolatry quickly made its appearance; but what gave rise to it is not certainly known. This form of superstition indeed seems to be natural to man, especially when placed in such a situation as affords him little opportunity of instruction, or of improving his rational faculties. Such a conclusion may be deduced from the caution given to the Jews, lest, when they looked up to the sun, moon, and stars, and the rest of the host of heaven, they should be driven to worship them. The origin of idolatry amongst the Syrians and Arabians, and also in Greece, is therefore accounted for with reference to their situation and the general aspect of nature. In those uncomfortable deserts, where the day presents nothing to the view but the uniform, tedious, and melancholy prospect of barren sands, the night discloses a most delightful and magnificent spectacle, and appears arrayed with charms of the most attractive kind. For the most part unclouded and serene, it exhibits to the wondering eye the host of heaven in all their variety and glory. In the view of this stupendous scene, the transition from admiration to idolatry was but too easy to uninstructed minds; and a people whose climate offered no beauties to contemplate but those of the firmament, would naturally look thither for the objects of their worship. The form of idolatry in Greece was different from that of the Syrians, which perhaps may be attributed to that smiling and variegated scene of mountains, valleys, rivers, woods, groves, and fountains, which the transported imagination, in the midst of its pleasing astonishment, supposed to be the seats of invisible deities.

A difficulty, however, arises on this supposition; for if idolatry is naturally produced in the mind of uninstructed and savage man from a view of the creation, why has not idolatry of some kind or other existed amongst all the different nations of the world? This certainly has not been the case, for the Persians of old, and the Moguls in modern times, were not idolators. Both these nations professed strict deism, so that some other causes must have concurred in producing idolatry besides those already mentioned; and of these causes an imperfect and obscure notion of the true religion appears to be by far the most probable.

Though idolatry, therefore, was formerly prevalent, it neither extended over the whole earth, nor were the superstitions of idolators all of one kind. Every nation had its respective gods, over which one more excellent than the rest was said to preside; yet in such a manner that this supreme deity himself was controlled by the rigid empire of the fates, or by what philosophers denominate eternal necessity. The gods of the East were different from those of the Gauls, the Germans, and the other northern nations. The Grecian divinities differed from those of the Egyptians, who deified plants, animals, and a great variety of the productions both of nature and art. Each people also worshipped and appeased their respective deities in a manner entirely different from the sacred rites of other countries. All this variety of religions, however, produced neither wars nor dissensions amongst the different nations; and each nation suffered its neighbours to follow their own method of worship, without discovering any hostility on that account. But there is nothing surprising in this mutual toleration, when we consider that they all looked upon the world as one great empire, divided into various provinces, over each of which a certain order of divinities presided; and hence they imagined that none could behold with contempt the gods of other nations, or force strangers to pay homage to theirs. The Romans exercised this toleration in the most ample manner; for though they would not allow any change to be made in the religions which were publicly professed in the empire, nor any new form of worship to be openly introduced, yet they granted to their citizens a full liberty of observing in private the sacred rites of other nations, and of honouring such foreign deities as they thought worthy of their homage.

The heathen deities were honoured with rites and sacrifices of various kinds, according to their respective natures and offices. But their rites were absurd and their observances ridiculous; whilst the priests appointed to preside over this strange worship abused their authority, by imposing upon the people in the grossest manner.

From the time of the Flood till the coming of Christ, idolatry prevailed amongst almost all the nations of the world, the Jews alone excepted; and even they were on all occasions ready to fall into it, as is evident from their history in the Old Testament. At the time of Christ's appearance, the religion of the Romans, as well as their empire, extended over a great part of the then known world. There were amongst the heathens indeed some who perceived the absurdities of that system; but being destitute of means, as well as of ability, to effect a reformation, matters went on in their old way. Though there were at that time various sects of philosophers, yet all of them proceeded upon false principles, and consequently could be of no service to the advancement or reformation of religion. Nay, some, amongst whom were the Epicureans and Academics, declared openly against every kind of religion.

At this time two religions flourished in Palestine, the Jewish and Samaritan, between the respective followers of which there reigned the most violent hatred and contempt. The difference between them seems to have been chiefly about the place of worship, which the Jews contended should be in Jerusalem, and the Samaritans on Mount Gerizzim. But though the Jews were certainly right as to the locality, they had in other respects greatly corrupted their religion. They expected a Saviour indeed; but they mistook his character, imagining that he was to be a powerful and warlike prince, who should set them free from the Roman yoke, which they bore with the utmost impatience. They also conceived that the whole of religion consisted in observing the rites of Moses, and some others which they had added to these, without the least regard to what is commonly called morality or virtue. This seems evident from the many charges which our Saviour brings against the Pharisees, who had the greatest reputation for sanctity in the whole nation. To these corrupt and vicious principles they added several absurd and superstitious notions concerning the divine nature, invisible powers, magic, and the like, which they had partly imbibed during the Babylonian captivity, and partly derived from their neighbours in Arabia, Syria, and Egypt. The principal sects amongst them were the Essenes or Essenians, Pharisees, and Sadducees. The Samaritans, according to the most general opinion, had corrupted their religion still more than the Jews.

Hence, when the true religion was preached by the Saviour of mankind, it is not to be wondered at if he became on that account obnoxious to a people so deeply sunk as the Jews then were in corruption and ignorance. It is not requisite here to enter into the particulars of the doctrine advanced by him, or of the opposition which he met with from the Jews. The rapid progress of the Christian religion, under its faithful and inspired ministers, soon alarmed the Jews, and raised various persecutions against its followers. The Jews, indeed, appear at first to have been everywhere the chief promoters of persecution. We find indeed that they officiously went from place to place, wherever they heard of the increase of the gospel, and by their calumnies and false suggestions endeavoured to excite the people against the apostles. The Heathens, however, though at first they showed no very violent spirit of persecution against the Christians, soon came to hate them as much as the Jews themselves. Tacitus acquaints us with the cause of this hatred, when speaking of the first general persecution under Nero. That inhuman emperor having, as was supposed, set fire to the city of Rome, to avoid the imputation of this wickedness, transferred the odium of the atrocious act to the Christians. The historian informs us that they were already abhorred on account of their many and enormous crimes. "The author of this name (Christians)," says he, "was Christ, who, in the reign of Tiberius, was executed under Pontius Pilate, procurator of Judæa. The pestilent superstition was for a while suppressed; but it revived again, and spread, not only over Judæa, where this evil was first broached, but reached Rome, whither is constantly flowing from every quarter of the earth whatever is hideous and abominable amongst men, and where it is readily embraced and practised. First, therefore, were apprehended such as openly avowed themselves to be of that sect; then by them were discovered an immense multitude; and all were convicted, not of the crime of burning Rome, but of hatred and enmity to mankind. Their death and tortures were aggravated by cruel derision and sport; for they were either covered with the skins of wild beasts, and torn in pieces by devouring dogs, or fastened to crosses, or wrapped up in combustible garments, that, when the day-light failed, they might, like torches, serve to dispel the darkness of the night. Hence, towards the miserable sufferers, however guilty and deserving of the most exemplary punishment, compassion arose, seeing they were doomed to perish not with a view to the public good, but to gratify the cruelty of one man."

That the account here given by Tacitus is downright misrepresentation and calumny, must be evident to every one who reads it. It is impossible that any person can be convicted of hatred and enmity to mankind, without specifying the facts by which this hatred showed itself. The burning of Rome would indeed have been a very plain indication of enmity to mankind; but of this Tacitus himself clears them, and mentions no other crime of which they were guilty. It is probable, therefore, that the only reason of this charge against the Christians, was their absolute refusal to have any share in the Roman idolatrous worship, or to countenance in any degree the absurd superstitions of Paganism.

The persecution under Nero was succeeded by another under Domitian, during which the apostle John was banished to Patmos, where he saw the visions, and wrote the book called the Apocalypse, which completes the canon of Scripture. This persecution commenced in the ninety-fifth year of the Christian era; and John is supposed to have written his Revelation the year after, or in the one that followed.

During the first century, the Christian religion spread over a great number of different countries; but as we have now no authentic records concerning the travels of the apostles, or the success which attended their ministry, it is impossible to determine how far the gospel was carried during this period. We are, however, assured, that even during this early period many corruptions were creeping in, the progress of which was with difficulty prevented even by the apostles themselves. Some corrupted their profession by an intermixture of Judaism, others by blending it with the oriental philosophy; whilst others, again, were already attempting to deprive their brethren of liberty, setting themselves up as eminent pastors, in opposition even to the apostles, as we learn from the epistles of St Paul, and the third epistle of St John. Hence arose the sects of the Gnostics, Cerinthians, Nicolaitans, Nazarenes, Ebionites, and many others, with which the church was troubled during this century.

Concerning the ceremonies and method of worship used by the Christians of the first century it is impossible to state any thing with certainty. Neither has the church order, government, and discipline, during this period, been ascertained with any degree of exactness. Each of those parties, therefore, which exist at this day, contends with the greatest earnestness for that particular mode of worship which they themselves have adopted; and some of the most bigoted would willingly monopolize the word Church in such a manner as to exclude from all hope of salvation every one who is not attached to their particular party. It does not, however, appear that, excepting baptism, the Lord's Supper, and anointing the sick with oil, any external ceremonies or symbols were properly of divine appointment. According to Dr Mosheim, there are several circumstances which seem to indicate that the friends and apostles of our blessed Lord either tolerated through necessity, or appointed for wise reasons, many other external rites in various places. "At the same time we are not to imagine that they ever conferred upon any person a perpetual, indelible, pontifical authority, or that they enjoined the same rites in all churches. We learn, on the contrary, from authentic records, that the Christian worship was from the beginning celebrated in a different manner in different places; and that, no doubt, by the orders, or at least with the approbation, of the apostles and their disciples. In those early times, it was both wise and necessary to show, in the establishment of outward forms of worship, some indulgence to the ancient opinions, manners, and laws, of the respective nations to whom the gospel was preached."

The second century commences with the third year of the Emperor Trajan. The Christians were still persecuted; but as the Roman emperors of this century were for the most part princes of a mild and moderate temper, they persecuted less violently than formerly. Marcus Aurelius, notwithstanding the clemency and philosophy for which he is so much celebrated, treated the Christians worse than Trajan, Hadrian, or even Severus himself, who was noted for his cruelty. This respite from rigorous persecution proved a favourable circumstance for the diffusion of the Christian religion; yet it is by no means easy to point out the particular countries through which it had already spread. We are, however, assured, that in the second century, Christ was worshipped as God throughout almost the whole East, as also amongst the Germans, Spaniards, Celts, and many other nations; but which of them received the gospel in the first century, and which in the second, is a question which at this distance of time cannot be satisfactorily determined. The writers of this century attribute the rapid progress of Christianity chiefly to the extraordinary gifts which were imparted to the first Christians, and the miracles which were wrought at their command; without supposing that any part of the success ought to be ascribed to the intervention of human means, or secondary causes. Many of the moderns, however, are so far from being of this opinion, that they are willing either to deny the authenticity of all miracles said to have been wrought since the days of the apostles, or to ascribe them to the power of the devil. But to enter into the particulars of this controversy is foreign to our present purpose; and for this reason we must refer to the writers on polemical divinity, who have largely treated of this and other points of a similar nature.

The corruptions which had been introduced in the first century, and which were almost coeval with Christianity itself, continued to gain ground in the second. Ceremonies, in themselves futile and useless, but which must be considered as highly pernicious when joined to a religion incapable of any other ornament than the upright and virtuous conduct of its professors, were multiplied for no other purpose than to please the ignorant multitude. The immediate consequence of this was, that the attention of Christians was drawn aside from the important duties of morality; and they were led to imagine, that a careful observance of the ceremonies might make amends for the neglect of moral duties. This was the most pernicious opinion which could possibly be entertained; and was indeed the very foundation of that enormous system of ecclesiastical power which was afterwards organized, and which for many ages held the whole world in barbarism and slavery.

Another mischief was the introduction of *mysteries*, as they were called, into the Christian religion; that is, insinuating that some parts of the worship in common use had a hidden efficacy and power far superior to the plain and obvious meaning assigned to them by the vulgar. By paying peculiar respect to these mysteries, the pretended teachers of the religion of Jesus accommodated their doctrines to the taste of their heathen neighbours, whose religion consisted in a multitude of mysteries, of which nobody knew the meaning.

By these, and other means of a similar description, the Christian pastors greatly abridged the liberty of their flocks. Being masters of the ceremonies and mysteries of the Christian religion, they had it in their power to make their followers believe and worship whatever they might think proper; and this they did not fail to make use of for their own advantage. They persuaded the people that the ministers of the Christian church succeeded to the character, rights, and privileges, of the Jewish priesthood; and the bishops considered themselves as invested with a rank and character similar to those of the high priest amongst the Jews, whilst the presbyters represented the priests, and the deacons the Levites. This notion, which was first introduced in the reign of Hadrian, proved a source of considerable honour and profit to the clergy.

The form of ecclesiastical government was in this century rendered uniform and permanent. An inspector or bishop presided over each Christian assembly, and to this office he was elected by the voice of the people. To assist him in his office he formed a council of presbyters, which was not confined to any stated number. To the bishops and presbyters the ministers or deacons were subject; and the latter were divided into a variety of classes, as the different exigencies of the church required. During the greater part of this century, the churches were independent of each other; nor were they united together by any other bonds than those of charity. Each assembly was a little state governed by its own laws, which were either enacted, or at least approved of, by the society. But in process of time all the Christian churches of a province were formed into one large ecclesiastical body, which, like confederate states, assembled at certain times, in order to deliberate concerning the common interests of the whole. This institution had its origin amongst the Greeks; but in a short time it became universal, and similar assemblies were formed in all places where the gospel had been planted. These assemblies, which consisted of the deputies or commissioners from several churches, were called Synods by the Greeks, and Councils by the Latins; and the laws enacted in these general meetings were called Canons, or rules.

These councils, of which we find not the smallest trace before the middle of this century, changed the whole face of the church, and gave it a new form; for by them the ancient privileges of the people were considerably diminished, and the power and authority of the bishops proportionally augmented. The humility and prudence of these pious prelates indeed hindered them from assuming all at once the power with which they were invested. At their first appearance in these general councils, they acknowledged that they were no more than the delegates of their respective churches, and that they acted in the name and by the appointment of their people. But afterwards changing this humble tone, they imperceptibly extended the limits of their authority; turned their influence into dominion, their counsels into laws; and at length openly asserted that Christ had empowered them to prescribe to his people authoritative rules of faith and manners. Another effect of these councils was the gradual abolition of that perfect equality which had reigned amongst all bishops in the primitive times. For the order and decency of these assemblies required, that some one of the provincial bishops met in council should be invested with a superior degree of power and authority; and hence originated the rights of metropolitans. In the mean time, the bounds of the church were enlarged; the custom of holding councils was followed wherever the sound of the gospel had reached; and the universal church had now the appearance of one vast republic, formed by a combination of a great number of small states. This occasioned the creation of a new order of ecclesiastics, who were appointed in different parts of the world as heads of the church, and whose office it was to preserve the consistence and union of that immense body, the members of which were so widely dispersed throughout the nations. Such was the nature and office of the Patriarchs, amongst whom, at length, ambition, having arrived at its greatest excess, formed a new dignity, investing the bishop of Rome with the title and authority of the Prince of the Patriarchs.

During the second century, there continued all the sects which had sprung up in the first, with the addition of several others, the most remarkable of which were the Ascetics. This sect owed its rise to an error propagated by some doctors of the church, who asserted that Christ had established a double rule of sanctity and virtue for two different orders of Christians. Of these rules, the one was ordinary and the other extraordinary; the one of a lower dignity, the other more sublime; the first for persons engaged in the active scenes of life, the second for those who, in a sacred retreat, aspired after the glory of a celestial state. They accordingly divided into two parts all those moral doctrines and instructions which they had received either by writing or tradition, calling one of these divisions precepts, and the other counsels. The name of precepts they gave to those laws which were universally obligatory upon all orders of men; and that of counsels to those which related to Christians of a more sublime rank, who proposed to themselves great and glorious ends, and breathed after an intimate communion with the Supreme Being. Thus were produced all at once a new set of men, who made pretensions to uncommon sanctity and virtue, and declared their resolution of obeying all the precepts and counsels of Christ, in order to their enjoyment and communion with God here, and also that, after the dissolution of their mortal bodies, they might ascend to him with the greater facility, and find nothing to retard their approach to the centre of happiness and perfection. They looked upon themselves as prohibited from the use of things which it was lawful for other Christians to enjoy, such as wine, flesh, matrimony, and commerce. They thought it their indispensable duty to extenuate their body by watchings, abstinence, labour, and hunger. They looked for felicity in solitary retreats, and in desert places, where, by severe and assiduous efforts of sublime meditation, they sought to raise the soul above all external objects, and all sensual pleasures. They were distinguished from other Christians, not only by the titles of *Ascetics*, *Σπουδαιοι*, *Εκλεκτοι*, and philosophers, but also by their garb. In this century, indeed, those who embraced such an austere mode of life submitted themselves to all these mortifications in private, without breaking asunder their social bands, or withdrawing themselves from mankind; but in process of time they retired into deserts, and, after the example of the Essenes and Therapeutæ, formed themselves into regular companies.

This austere sect originated in a belief which has been more or less prevalent in all ages and in all countries, namely, that religion consists more in prayers, meditations, and a kind of secret intercourse with God, than in fulfilling the social duties of life, and in acts of benevolence and humanity to mankind. Nothing can be more evident indeed than that the Scripture reckons the fulfilling of these infinitely superior to the observance of all the ceremonies which can be imagined. Yet it somehow or other happens, that almost everybody is more inclined to observe the ceremonial part of devotion than the moral; and hence, according to the different humours or constitutions of different persons, there have been numberless forms of Christianity, and the most virulent contentions amongst those who professed themselves followers of the Prince of Peace. It is obvious, that if the moral conduct of Christians was to be made the standard of faith, instead of speculative opinions, all these divisions must cease in a moment; but whilst Christianity, or any part of it, is made to consist in speculation, or the observance of ceremonies, it is impossible there can be any end of sects or heresies. No opinion whatever is so absurd, but some people have pretended to argue in its defence; no ceremony is so insignificant, but it has been explained and sanctified by hot-headed enthusiasts; and hence sects, ceremonies, and absurdities, have been multiplied without number, to the prejudice of society and the detriment of the Christian religion. This short relation of the rise of the Ascetic sect will also serve to account for the rise of any other; so that we apprehend it is needless to enter into particulars concerning the rest, as they all took their origin from the same general principle variously modified, according to the different dispositions of mankind.

The Ascetic sect originated in Egypt, whence it passed into Syria and the neighbouring countries. At length it reached the European nations; and hence that train of austere and superstitious vows and rites which totally obscured, or rather annihilated, Christianity, together with the celibacy of the clergy, and many other absurdities of a similar description. The errors of the Ascetics, however, did not stop here. In compliance with the doctrines of some Pagan philosophers, they affirmed that it was not only lawful, but even praiseworthy, to deceive, and to use the expedient of a lie, in order to advance the cause of piety and truth; and hence the "pious frauds" with which the church of Rome has been so often reproached.

In proportion as Christians thus deviated from the true practice, they became more zealous in the external profession of their religion. Anniversary festivals were celebrated in commemoration of the death and resurrection of Christ, and of the effusion of the Holy Ghost on the apostles. But concerning the days on which these festivals were to be kept there arose violent contests. The Asiatic churches in general differed in this point from those of Europe; and towards the conclusion of the second century, Victor, bishop of Rome, took it into his head to force the eastern churches to follow the rules laid down by those of the West. But this they absolutely refused to comply withal, upon which Victor cut them off from communion with the church of Rome; though, by the intercession of some prudent persons, the difference was temporarily composed.

During most of the third century the Christians were allowed to enjoy their religion, such as it was, without molestation. The emperors Maximinus and Decius, indeed, made them feel all the rigours of a severe persecution; but the reigns of these persecutors were short, and from the death of Decius till the time of Diocletian the church enjoyed tranquillity. Vast multitudes were accordingly converted; but at the same time the doctrine of the church grew daily more corrupt, and the lives of professed Christians became more wicked and scandalous. New ceremonies were invented in great numbers, and an unaccountable passion prevailed for the oriental superstitions concerning dæmons, whence sprung the whole train of exorcisms, spells, and fears for the apparition of evil spirits, which are not yet entirely eradicated. From the same source was also derived the custom of avoiding all connections with those who were not baptized, or who lay under the penalty of excommunication, as persons supposed to be under the dominion of some evil spirit; and hence the rigorous severity of that discipline and penance imposed upon those who had incurred, by their immoralities, the censure of the church. Several alterations were now made in the manner of celebrating the eucharist. The prayers used on this occasion were lengthened, the solemnity and pomp with which it was attended were considerably increased, and gold and silver vessels were used in its celebration. It was now thought essential to salvation, and for that reason administered even to infants. Baptism was celebrated twice a year to such as, after a long course of trial and preparations, offered themselves as candidates for admission into the church. The remission of sins was believed to be its immediate consequence, whilst the bishop, by prayer and imposition of hands, was supposed to confer those sanctifying gifts of the Holy Spirit which were necessary to a life of righteousness and virtue. An evil dæmon was supposed naturally to reside in every person, and was accounted the author and source of all the corrupt dispositions and unrighteous actions of that person. The expulsion of this dæmon therefore formed an essential requisite for baptism; and hence the baptized persons returned home clothed in white garments, and adorned with crowns, as sacred emblems, the former of their inward purity and innocence, and the latter of their victory over sin and the world. Fasting began now to be held in more esteem than formerly. A high degree of sanctity was attributed to this practice; it was even looked upon as indispensably necessary, from a notion that the dæmons directed their force chiefly against those who pampered themselves with delicious fare, and were less troublesome to the lean and hungry who lived under the severities of a rigorous abstinence. The sign of the cross was also supposed to possess a victorious power over all sorts of trials and calamities; it was more especially considered as the surest defence against the snares and stratagems of malignant spirits; and for this reason no Christian undertook any thing of moment, without arming himself, as he imagined, with the power of this triumphant sign. The heresies which troubled the church during this century were those of the Gnostics, whose doctrines were new-modelled and improved by Manes, the founder of the Manicheans, the Hieracites, Noetians, Sabellians, and Novatians; but for a particular account of these sects, the reader is referred to the articles under their respective names.

The fourth century is remarkable for the establishment of Christianity by law in the Roman empire, which took place in the year 324. In the beginning of this century the empire was governed by four chiefs; Diocletian, Maximian, Constantius Chlorus, and Galerius, under whom the church enjoyed complete toleration. Diocletian, though much addicted to superstition, entertained no hatred of the Christians; and Constantius Chlorus, having abandoned polytheism, treated them with condescension and benevolence. This alarmed the Pagan priests, whose interests were so closely connected with the continuance of the ancient superstitions, and who apprehended, not without reason, that the Christian religion would at length prevail throughout the empire. To prevent the downfall of the Pagan superstition, therefore, they applied to Diocletian and Galerius Cæsar, by whom a bloody persecution was commenced in the year 303, and continued till 311. An asylum, however, was opened for the Christians in the year 304. Galerius having dethroned Diocletian and Maximian, declared himself emperor in the East, leaving to Constantius Chlorus all the western provinces, to which great numbers of Christians resorted to avoid the cruelty of the persecutor. But Galerius being at length overtaken with a dreadful and incurable disease, published an edict ordering the persecution to cease, and restoring freedom to the Christians, whom, for eight years, he had most inhumanly oppressed. Galerius died the same year; and in a short time afterwards, when Constantine the Great ascended the throne, the Christians were freed from any further uneasiness, by his abrogating all the penal laws enacted against them, and afterwards issuing edicts by which no other religion than the Christian was tolerated throughout the empire.

But this event, so favourable to the outward peace of the church, was far from promoting its internal harmony, or the reformation of its leaders. The clergy, who had all this time been augmenting their power at the expense of the liberty of the people, now set no bounds to their ambition. The bishop of Rome was the first in rank, and distinguished by a sort of pre-eminence above the rest of the prelates. He surpassed all his brethren in the magnificence and splendour of the church over which he presided, in the riches of his revenues and possessions, in the number and variety of his ministers, in his credit with the people, and in his sumptuous and splendid manner of living. Hence it happened, that when a new pontiff was to be chosen by the presbyters and people, the city of Rome was generally agitated with dissensions, tumults, and cabals, which often produced fatal consequences. The intrigues and disturbances which prevailed in that city in the year 366, when, upon the death of Liberius, another pontiff was to be chosen in his room, are a sufficient proof of what we have advanced. Upon that occasion, one faction elected Damasus to that high dignity; whilst the opposite party chose Ursicinus, a deacon of the vacant church, to succeed Liberius. This double election gave rise to a dangerous schism, and to a sort of civil war within the city of Rome, which was carried on with the utmost fury and barbarity, and produced the most cruel massacres and desolations. The inhuman contest ended in the victory of Damasus; but whether his cause was more or less just than that of Ursicinus, cannot now be determined with any degree of certainty.

Notwithstanding the pomp and splendour which surrounded the Roman see, it appears that the bishops of Rome had not yet acquired that pre-eminence of power and jurisdiction which they afterwards enjoyed. In the ecclesiastical commonwealth, indeed, they were the most eminent order of citizens; but still they were citizens as well as their brethren, and subject, like them, to the laws and edicts of the emperors. All religious causes of extraordinary importance were examined and determined either by judges appointed by the emperors, or in councils assembled for that purpose; whilst those of inferior moment were decided in each district by its respective bishop. The ecclesiastical laws were enacted either by the emperor or by the councils. None of the bishops acknowledged that they derived their authority from the permission and appointment of the bishop of Rome, or that they were created bishops by the favour of the Apostolic See. On the contrary, they all maintained that they were the ambassadors and ministers of Jesus Christ, and that their authority was derived from above. It must, however, be observed, that even in this century several of those steps were laid by which the bishops of Rome afterwards ascended to the summit of ecclesiastical power and authority. This happened partly by the imprudence of the emperors, partly by the dexterity of the Roman prelates themselves, and partly by the inconsiderate zeal and precipitate judgment of certain bishops. The imprudence of the emperor, and the precipitation of the bishops, were remarkably discovered in an event which greatly favoured the ambition of the Roman pontiff. About the year 372, Valentinian enacted a law, empowering the bishop of Rome to examine and judge other bishops, in order that religious disputes might not be decided by any profane or secular judges. The bishops assembled in council at Rome in 378, not considering the consequences which might ensue from this imprudent law, both to themselves and to the church, declared their approbation in the strongest terms, and recommended the execution of it in their address to the emperor Gratian. Some think, indeed, that this law empowered the bishop of Rome to judge only the bishops within the limits of his jurisdiction; but others are of opinion that his power was given only for a certain time, and for a particular purpose. This last notion seems the most probable; but still the privilege in question must have proved an excellent instrument for the advancement of sacerdotal ambition.

By the removal of the seat of empire to Constantinople, the emperor raised up, in the bishop of this new metropolis, a formidable opponent to the bishop of Rome, and erected a bulwark which threatened a vigorous opposition to his growing authority. For as the emperor, desiring to render Constantinople a second Rome, enriched it with all the rights and privileges, honours and ornaments, of the ancient capital of the world; so its bishop, measuring his own dignity and rank by the magnificence of the new city, and its eminence as the seat of empire, assumed an equal degree of authority with the bishop of Rome, and claimed a superiority over the rest of the episcopal order. Nor did the emperors disapprove of these high pretensions, since they considered their own dignity as connected in a certain measure with that of the bishop of the imperial city. Accordingly, in a council held at Constantinople in the year 381, by the authority of Theodosius the Great, the bishop of that city was, during the absence of the bishop of Alexandria, and against the consent of the Roman pontiff, placed, by the third canon of that council, in the first rank after the bishop of Rome, and consequently above those of Alexandria and Antioch. Nectarius was the first bishop who enjoyed the new honours accumulated on the see of Constantinople. His successor, the celebrated John Chrysostom, extended still further the privileges of that see, and submitted to its jurisdiction all Thrace, Asia, and Pontus; nor were the succeeding bishops of the imperial city destitute of a fervent zeal to augment their privileges and extend their dominion. By this unexpected promotion, however, the most disagreeable effects were produced. The bishops of Alexandria were not only filled with the most inveterate hatred against those of Constantinople, but a contention was excited between the bishops of Rome and Constantinople, which, after being carried on for ages, terminated at last in the separation of the Greek and Latin churches.

Constantine the Great, in order to prevent civil commotions, and to fix his authority on a stable and solid foundation, made several changes not only in the laws of the empire, but also in the form of the Roman government. And as many important reasons induced him to adapt the administration of the church to these changes in the civil constitution, this necessarily introduced amongst the bishops new degrees of rank and eminence. The four bishops, of Rome, Constantinople, Antioch, and Alexandria, were distinguished by a certain degree of pre-eminence over the rest. These four prelates answered to the four prætorian prefects created by Constantine; and it is possible, that even in this century they were distinguished by the Jewish title of patriarchs. After them followed the exarchs, who had the inspection of several provinces, and answered to the appointment of certain civil officers who bore the same title. In a lower class were the metropolitans, who had only the government of one province; under whom were the archbishops, whose inspection was confined to certain districts. In this gradation the bishops brought up the rear; but the sphere of their authority was not in all places equally extensive, being in some considerable, and in others confined within narrow limits. To these various ecclesiastical orders we might add that of the *Chorepiscopi*, or superintendents of the country churches; but this last order was in most places suppressed by the bishops, with the design of extending their own authority, and enlarging the sphere of their own power and jurisdiction. The administration of the church itself was divided by Constantine into an external and internal inspection. The latter, which was committed to bishops and councils, related to religious controversies, the forms of divine worship, the offices of priests, the vices of the ecclesiastical orders, and other matters. The external administration of the church the emperor assumed to himself. This comprehended all those things which related to its outward state and discipline; it likewise extended to all contests which might arise between the ministers of the church, superior as well as inferior, concerning their possessions, their reputation, their rights and privileges, their offences against the laws, and other matters, but no controversies which related to matters purely spiritual were cognizable by this external inspection. In consequence of this artful division of the ecclesiastical government, Constantine and his successors called councils, presided in them, appointed the judges of religious controversies, terminated the differences which arose between the bishops and the people, fixed the limits of the ecclesiastical provinces, took cognizance of the civil causes which originated between the ministers of the church, and punished the crimes committed against the laws by the ordinary judges appointed for that purpose, giving over all causes purely ecclesiastical to the bishops and councils. But this division of the administration of the church was never explained with sufficient accuracy; and hence both in the fourth and fifth centuries there are frequent instances of the emperors determining matters purely ecclesiastical, and likewise of bishops and councils determining matters which related merely to the external form and government of the church.

After the time of Constantine many additions were made by the emperors and others to the wealth and honours of the clergy; and these additions were followed by a proportional increase of their vices and luxury, particularly amongst those who lived in great and opulent cities. The bishops, on the one hand, contended with each other in the most scandalous manner concerning the extent of their respective jurisdictions; whilst, on the other, they trampled on the rights of the people, violated the privileges of the inferior clergy, and imitated in their conduct and in their manner of living the arrogance, voluptuousness, and luxury of magistrates and princes. This pernicious example was soon followed by the several ecclesiastical orders. The presbyters, in many places, assumed an equality with the bishops in point of rank and authority. Many complaints are also made by the authors of this century concerning the vanity and effeminacy of the deacons. Those more particularly of the presbyters and deacons who filled the first stations of these orders, carried their pretensions to an extravagant length, and were offended at the notion of being placed on an equality with their colleagues. For this reason they not only assumed the titles of Archpresbyters and Archdeacons, but also claimed a degree of authority and power much superior to that which was vested in the other members of their respective orders.

In the fifth century, the bishops of Constantinople having already reduced under their jurisdiction all the Asiatic provinces, began to aim at a still further increase of power. By the twenty-eighth canon of the council held at Chalcedon in 451, it was resolved that the same rights and honours which had been conferred upon the bishop of Rome were due to the bishop of Constantinople, on account of the equal dignity and lustre of the two cities in which these prelates exercised their authority. The same council by a solemn act confirmed the bishop of Constantinople in the spiritual government of those provinces over which he had usurped the jurisdiction. Leo the Great, bishop of Rome, opposed with vehemence the enactment of these laws; and his opposition was seconded by that of several other prelates. But their efforts were vain, as the emperors threw in their weight into the balance, and thus supported the decisions of the Grecian bishops. In virtue of the decisions of this famous council, therefore, the bishop of Constantinople began to contend obstinately with the Roman pontiff for the supremacy, and to crush the bishops of Antioch and Alexandria. About the same time, Juvenal, bishop of Jerusalem, attempted to withdraw himself and his church from the jurisdiction of the bishop of Cæsarea, and aspired to a place amongst the first prelates of the Christian world. The high degree of veneration and esteem in which the church of Jerusalem was held amongst all the other Christian societies, on account of its rank amongst the apostolical churches, and its title to the appellation of *mother church*, as having succeeded the first Christian assembly formed by the apostles, was extremely favourable to the ambition of Juvenal, and rendered his project much more practicable than it would otherwise have been. Encouraged by this, and likewise by the protection of Theodosius the younger, this aspiring prelate not only assumed the dignity of patriarch of all Palestine, a rank which rendered him independent of all spiritual authority; but also invaded the rights of the bishop of Antioch, and usurped his jurisdiction over the provinces of Phœnicia and Arabia. Hence there arose between Juvenal, and Maximus bishop of Antioch, a warm contest, which the council of Chalcedon decided, by restoring to the latter the provinces of Phœnicia and Arabia, and confirming the former in the spiritual possession of all Palestine, and in the high rank which he had assumed in the church.

In 588, John, bishop of Constantinople, surnamed the *Faster*, either by his own authority, or by that of the emperor Mauritius, summoned a council at Constantinople, to inquire into an accusation brought against Gregory, bishop of Antioch; and upon this occasion he assumed the title of Œcumenical or Universal Bishop. This title had been formerly enjoyed by the bishop of Constantinople without any offence; but Gregory the Great, at that time bishop of Rome, suspecting that John was aiming at establishing supremacy over all the churches, opposed his claim with the greatest vigour. For this purpose he applied by letters to the emperor, and others whom he thought capable of assisting him in his opposition; but all his efforts were without effect; and the bishops of Constantinople were allowed to enjoy the disputed title, though not in the sense which had alarmed the Roman pontiff.

Gregory, however, adhered tenaciously to his purpose; raised new tumults and dissensions amongst the clergy; and aimed at nothing less than an unlimited supremacy over the Christian church. This ambitious design succeeded in the West; but in the eastern provinces his arrogant pretensions were scarcely respected by any excepting those who were at enmity with the bishop of Constantinople. How much the people were at this time deluded by the Roman pontiffs, appears from the expression of Ennodius, one of the flatterers of Symmachus, a prelate of but ambiguous fame, that the Roman pontiff was constituted judge in the place of God, and acted as the vicegerent of the Most High. On the other hand, from a variety of authentic records, it may be concluded that both the emperors and the nations in general were far from being disposed to bear with patience the yoke of servitude which the see of Rome was thus labouring to impose on the whole church.

In the beginning of the seventh century, according to the most learned historians, Boniface III. engaged Phocas, emperor of Constantinople, to deprive the bishop of that metropolis of the title of œcumenical or universal bishop, and to confer it upon the Roman pontiff; and thus was first introduced the supremacy of the pope. Meanwhile the Roman pontiffs employed every method to maintain and enlarge their authority and pre-eminence.

In the eighth century, the power of the bishop of Rome, and of the clergy in general, increased prodigiously. The principal cause of this was the method at that time employed by the European princes to secure themselves on their thrones. All these princes being then occupied either in usurpation or in self-defence, and the whole Continent being in the most unsettled and barbarous condition, they endeavoured to attach to their interests those whom they considered as their friends and clients. With this view they distributed amongst the latter extensive territories, cities, and fortresses, with the various rights and privileges belonging to them; reserving only to themselves the supreme dominion, and the military service of these powerful vassals. Hence the European princes reckoned it a high instance of political prudence to distribute amongst the bishops and other Christian doctors the same sort of donations which had formerly been given to their generals and clients. By means of the clergy, they hoped to check the seditious and turbulent spirits of their vassals, and to maintain them in obedience by the influence and authority of their bishops, whose commands were highly respected, and whose spiritual thunderbolts, rendered formidable by ignorance, struck terror into the boldest and most resolute hearts.

This prodigious accession to the opulence and authority of the clergy in the West began at their head, the Roman pontiff; and from him it descended, spreading gradually amongst the inferior sacerdotal orders. The barbarous nations who had received the gospel looked upon the bishop of Rome as the successor of their chief druid or high priest; and as this druid had, under the darkness of Paganism, enjoyed boundless authority, so these barbarous nations thought proper to confer upon the supreme pontiff the same authority which had belonged to the chief druid. The pope received these august privileges with undisguised satisfaction; and lest attempts should be made to deprive him thereof, he strengthened his titles to these extraordinary honours by a variety of passages drawn from ancient history, and even by arguments of a religious nature. This increased the power of the pope enormously, and gave to the see of Rome that high pre-eminence and despotic authority in civil and political matters which were unknown to former ages. Hence, amongst other unhappy circumstances, arose the pernicious opinion, that such persons as were excluded from the communion of the church by the pontiff himself, or by any of the bishops, forfeited not only their civil rights and advantages as citizens, but even the common claims and privileges of humanity. This monstrous opinion, which proved a fatal source of wars, massacres, and rebellions, and which contributed more than any thing else to confirm and augment the papal authority, was borrowed by the clergy from the Pagan superstitions. Though, from the time of Constantine the Great, excommunication was, in every part of the Christian world, attended with many disagreeable consequences, yet its highest terrors were confined to Europe, where its aspect was truly formidable and hideous. But in the eighth century it acquired a new accession of terror; and from that period the excommunication practised in Europe differed entirely from that which was in use in other parts of Christendom. Excommunicated persons were indeed considered in all places as objects of hatred both to God and man; but they were not on that account robbed of the privileges of citizens, nor of the rights of humanity; much less were those kings and princes, whom an insolent bishop had thought proper to exclude from the communion of the church, supposed to forfeit on that account their crowns or their territories. But from this century it was quite otherwise in Europe. Excommunication received that plenary power which dissolved all connections; those whom the bishops or their head excluded from church communion were degraded to a level with the beasts. This unnatural power took its origin in an ignorant misconception. Upon the conversion of the barbarous nations to Christianity, these proselytes confounded the excommunication in use amongst Christians with that which had been practised in the times of Paganism, and which was attended with all the dreadful effects above mentioned. The Roman pontiffs, on the other hand, were too artful not to encourage this error; and hence they employed all sorts of means to gain credit to an opinion so well calculated to gratify their ambition, and to aggrandize the episcopal order.

The annals of the French nation furnish us with an instance of the enormous power which was at this time vested in the Roman pontiff. Pepin, who was mayor of the palace to Childeric III. king of France, and who in the exercise of that high office possessed in reality the royal power and authority, aspired to the titles and honours of majesty, and formed a scheme for dethroning his sovereign. For this purpose he assembled the states in 751; and although they were devoted to the interests of the ambitious usurper, they gave it as their opinion that the bishop of Rome was previously to be consulted whether the execution of such a scheme was lawful or the contrary. Ambassadors were accordingly sent by Pepin to Zachary, the reigning pontiff, with the following question: "Whether the divine law did not permit a valiant and warlike people to dethrone a pusillanimous and indolent prince, who was incapable of discharging any of the functions of royalty, and to substitute in his place one more worthy to rule, and who had already rendered most important services to the state?" The situation of Zachary, who stood much in need of the succours of Pepin against the Greeks and Lombards, rendered his answer such as the usurper desired; and when this favourable decision of the Roman pontiff was published in France, the unhappy Childeric was stripped of his royalty without the least opposition, and Pepin stepped into the throne of his sovereign and master. This decision was solemnly confirmed by Stephen II. the successor of Zachary, who undertook a journey into France in the year 754, in order to solicit assistance against the Lombards. The pontiff at the same time dissolved the obligation of the oath of fidelity and allegiance which Pepin had violated by his usurpation in the year 751; and to render his title to the crown as sacred as possible, Stephen anointed and crowned him, with his wife and two sons, for the second time. This complaisance of the pope was rewarded with the exarchate of Ravenna and all its dependencies, as has already been related.

In the succeeding centuries, the Roman pontiffs continued by every means to increase their power; and by continually taking advantage of the civil dissensions which prevailed throughout Italy, France, and Germany, their influence in civil affairs rose to an enormous height. The increase of their authority in religious matters was not less rapid. The wisest and the most impartial amongst the Roman Catholic writers acknowledge, that from the time of Louis the Meek the ancient rules of ecclesiastical government were gradually changed in Europe by the counsels and instigation of the church of Rome, and new laws substituted in their stead. The European princes suffered themselves to be divested of the supreme authority in religious matters, which they had derived from Charlemagne; the power of the bishops was greatly diminished, and even the authority of both provincial and general councils began to decline. The popes, elated with their overgrown power, and rendered arrogant by the daily accessions which were made to their authority, sought to establish the maxim, that the bishop of Rome was constituted and appointed by Jesus Christ as supreme legislator and judge of the universal church, and that consequently the bishops derived all their authority from him. This opinion, which they inculcated with the utmost zeal and ardour, was opposed in vain by such as were acquainted with the ancient ecclesiastical constitutions, and the government of the church in the primitive ages. But in order to gain credit to this new ecclesiastical code, and to support the pretensions of the popes to supremacy, it was necessary to produce the authority of ancient deeds, in order to shut the mouths of such as were disposed to set bounds to their usurpations. The bishops of Rome were aware of this; and as all means were looked upon as lawful which tended to the accomplishment of their designs, they employed some of their most ingenious and zealous partisans in forging conventions, acts of councils, epistles, and such like records, by which it might appear that in the first ages of the church the Roman pontiffs were clothed with the same spiritual majesty and supreme authority which they now assumed. There were not wanting amongst the bishops, however, some men of prudence and sagacity, who saw through these pious frauds, and perceived the chains which were forging both for them and for the church. The French bishops distinguished themselves eminently in this respect; but their opposition was soon quashed; and as all Europe had sunk in the grossest ignorance and darkness, none remained who were capable of detecting these impostures, or disposed to support the expiring liberty of the church. It is proper to add, however, that these grievous charges are strenuously denied by Catholic writers.

In the eleventh century the power of the bishops of Rome seems to have attained its utmost height. They now received the pompous titles of masters of the world, and popes, or universal fathers. They presided everywhere in the councils by their legates, assumed the authority of supreme arbiters in all controversies which arose concerning religion or church discipline, and maintained the pretended rights of the church against the encroachments and usurpations of kings and princes. Their authority, however, was confined within certain limits. On the one hand, it was restrained by sovereign princes, that it might not arrogantly aim at civil dominion; and on the other, it was opposed by the bishops themselves, that it might not degenerate into a spiritual despotism, and utterly destroy the privileges and liberty of synods and councils. From the time of Leo IX. the popes employed every method which ambition could suggest to remove those limits, and to render their dominion both despotic and universal. They not only aspired to the character of supreme legislators in the church, to an unlimited jurisdiction over all synods and councils, whether general or provincial, and to the sole distribution of all ecclesiastical honours and benefices, as divinely authorized and appointed for that purpose; but they carried their pretensions so far as to give themselves out as lords of the universe, arbiters of the fate of kingdoms and empires, and supreme rulers over the kings and princes of the earth. Hence we find instances of their giving away kingdoms, and loosing subjects from their allegiance to their sovereigns, as in the case of King John of England. They even assumed the whole earth as their property, as well where Christianity was planted as where it was not. Accordingly, on the discovery of America and the East Indies, the pope, by virtue of this spiritual property, granted to the Portuguese a right to all the countries lying to the eastward, and to the Spaniards a right to all those lying to the westward, of Cape Non in Africa, which they were able to conquer by force of arms.

During all this time superstition reigned triumphant over the remains of Christianity which had escaped the corruptions of the first four centuries. In the fifth century commenced the invocation of the happy souls of departed saints. Their assistance was entreated by fervent prayers, whilst none stood up in opposition to this preposterous kind of worship. The images of those who during their lives had acquired the reputation of uncommon sanctity, were now honoured with a particular homage in several places; and many ignorant persons imagined that this drew into the images the propitious presence of the saints or celestial beings whom they were supposed to represent. A singular efficacy was attributed to the bones of martyrs, and to the figure of the cross, in defeating all the attempts of Satan, removing all sorts of calamities, and in healing not only the diseases of the body, but also those of the mind. The famous Pagan doctrine concerning the purification of departed souls by means of a certain kind of purgation, was also confirmed and explained more fully than it had formerly been; and it is well known of how much consequence this doctrine at one time proved to the wealth and the power of the church of Rome.

In the sixth century Gregory the Great advanced an opinion, that all the words of the sacred writings were images of invisible and spiritual things; and for this reason he loaded the churches with a multitude of ceremonies the most insignificant and futile that can well be imagined. Hence arose a new and most difficult science, namely, the explication of these ceremonies, and the investigation of the causes and circumstances whence they derived their origin. A new method was contrived of administering the Lord's Supper, with a magnificent assemblage of pompous ceremonies. This was called the Canon of the Mass. Baptism, excepting in cases of necessity, was administered only on the great festivals. An incredible number of temples were erected in honour of the saints. The places set apart for public worship were also very numerous. But now they were considered as the means of purchasing the protection and favour of the saints; and the ignorant and barbarous multitude were persuaded that these departed spirits defended and guarded against evils and calamities of every kind, the provinces, lands, cities, and villages in which they were honoured with temples. The number of these temples was almost equalled by that of the festivals, which were increased beyond all bounds, and formed a grievous deduction from the time of the people.

In the seventh century religion seemed to be altogether buried under a heap of superstitious ceremonies; the worship of the true God and Saviour of the world was exchanged for that of bones, relics, and images. The eternal state of misery threatened in Scripture to the wicked was commuted for the temporary punishment of purgatory; and the expressions of faith in Christ by an upright and virtuous conduct, for the augmentation of the riches of the clergy by donations to the church, and the observance of a heap of idle ceremonies. New festivals were still added; one in particular was instituted in honour of the true cross on which our Saviour had suffered; and churches were declared to be sanctuaries to all who fled to them, whatever their crimes might have been.

Superstition, it would seem, had now attained its highest pitch; nor is it easy to conceive any degree of ignorance and degeneracy greater than that which we have already mentioned. If any thing can possibly be imagined more contrary to true religion, it is an opinion which prevailed in the eighth century, that Christians might appease an offended deity by voluntary acts of mortification, or by gifts and oblations lavished on the church; and that people ought to place their confidence in the works and merits of the saints. Piety in this and some succeeding ages consisted in building and embellishing chapels; in endowing monasteries and basilicas; in hunting after the relics of saints and martyrs, and treating them with an absurd and excessive veneration; in procuring the intercession of the saints by rich oblations or superstitious rites; and in pilgrimages to those places which were esteemed holy, particularly to Palestine. The genuine religion of Jesus was now in a great measure unknown both to clergy and people. In this century also the superstitious custom of solitary masses had its origin. These were celebrated by the priest alone in behalf of the souls detained in purgatory, as well as upon other occasions. They were prohibited by the laws of the church, but proved a source of immense wealth to the clergy. Under Charlemagne they were condemned by a synod assembled at Mentz, as the result of avarice and sloth. A new superstition, however, sprung up in the tenth century. It was imagined that Antichrist was to make his appearance upon the earth, and that soon afterwards the world itself would be destroyed. An universal panic ensued. Vast numbers of people, abandoning all their connections in society, and giving over to the churches and monasteries all their worldly effects, repaired to Palestine, where they imagined that Christ would descend from heaven to judge the world; whilst others devoted themselves by a solemn and voluntary oath to the service of the churches, convents, and priesthood. All this proceeded from a notion that the supreme Judge would diminish the severity of their sentence, and look upon them with a more favourable eye, on account of their having made themselves the servants of his ministers. When an eclipse of the sun or moon happened to be visible, the cities were deserted, and their miserable inhabitants, flying for refuge to hollow caverns, hid themselves amongst the craggy rocks, and under the bending summits of steep mountains. The opulent attempted to bribe the saints and the Deity himself by rich donations conferred upon the sacerdotal order, who were looked upon as the immediate vicegerents of heaven. In many places, temples, palaces, and noble edifices, both public and private, were suffered to decay, or were deliberately pulled down, from a notion that they were no longer of any use, as the final dissolution of all things was at hand. In a word, no language is sufficient to express the confusion and despair which tormented the minds of miserable mortals upon that occasion. The general delusion was indeed opposed and combated by the discerning few, who endeavoured to dispel these terrors, and to efface the notion from which they arose in the minds of the people. But their attempts were ineffectual; nor could the dreadful apprehensions of the superstitious multitude be removed until the end of the century, when this terror became one of the accidental causes of the Crusades.

That nothing might now be wanting to complete the system of religion which had overspread all Europe, it was in the eleventh century determined that divine worship should be celebrated in the Latin tongue, though now almost unknown. During the whole of this century, also, Christians were employed in rebuilding and ornamenting their churches, which they had destroyed through the superstitious fears which have already been noticed.

Matters went on in much the same way till the time of the Reformation. The clergy were immersed in sloth, ignorance, and vice; and the laity, imagining themselves able to purchase the pardon of their sins for money, followed the examples of their pastors without remorse. The absurd principle formerly mentioned, that religion consists in acts of austerity, and an unknown mental correspondence with God, produced the most extravagant and ridiculous effects in the conduct of devotees and reputed saints. They not only lived amongst the wild beasts, but also after the manner of these savage animals; they ran naked through the lonely deserts with a furious aspect, and all the agitations of frenzy; they prolonged their wretched life by grass and wild herbs, avoided the sight and conversation of men, remained almost motionless in certain places for several years, exposed to the rigour and inclemency of the seasons, and towards the conclusion of their lives shut themselves up in narrow and miserable cells. But of all the instances of superstitious fanaticism which disgraced the times we are now speaking of, none was held in higher veneration, or excited more the wonder of the multitude, than that of a certain order of men who were called *Stylites* by the Greeks, and *Sancti Columnares*, or Pillar Saints, by the Latins. These were persons of a singular and extravagant turn of mind, who stood motionless on the tops of pillars raised expressly for this exercise of their patience, and remained there for several years amidst the admiration and applause of the populace. The inventor of this strange discipline was one Simeon, a Syrian, who commenced his career by exchanging the agreeable employment of a shepherd for the austerities of a monkish life. He began his devotion on the top of a pillar six cubits high; but as he increased in sanctity, he also augmented the height of his pillar, till, towards the conclusion of his life, he had established his piety on the top of a pillar forty cubits in height. Many of the inhabitants of Syria and Palestine, seduced by a false ambition and an utter ignorance of true religion, followed the example of this fanatic, though not with the same degree of austerity. This superstitious practice began in the fifth century, and continued in the East for nearly six hundred years. The Latins, however, had too much wisdom and prudence to imitate the Syrians and orientals in this whimsical superstition; and when a certain fanatic or impostor named Wulfilaicus erected one of these pillars in the country of Treves, and proposed to live upon it after the manner of Simeon, the neighbouring bishops ordered it to be pulled down.

The practices of austere worship and discipline in other respects, however, gained ground throughout all parts of Christendom. Monks of various kinds were to be found in every country in prodigious numbers. But though their discipline was at first exceedingly severe, it became gradually relaxed, and the monks gave in to all the prevailing vices of the times. Other orders succeeded, who pretended to still greater degrees of sanctity, and to reform the abuses of the preceding ones; but these in their turn became corrupted, and fell into the very same vices which they had blamed in others. The most violent animosities, disputes, and hatreds, also reigned amongst the different orders of monks, as well as amongst the clergy of all ranks and degrees, whether we consider them as classed in different bodies, or as individuals of the same body. To enter into a detail of their wranglings and disputations, the methods which each of them took to aggrandise themselves at the expense of their neighbours, and to keep the rest of mankind in subjection, would lead us far beyond the limits prescribed to this rapid sketch. We may only observe, that even the external profession of the austere and absurd piety which took place in the fourth and fifth centuries gradually declined. Some there were, indeed, who boldly opposed the torrent of superstition and depravity which threatened to overflow the whole world; but their opposition proved fruitless, and towards the era of the Reformation all of them had either been silenced or destroyed.

Whilst superstition and degeneracy thus reigned in the West, the absurd and sanguinary doctrines of Mahommed overspread all the East. The rise of this impostor is related elsewhere. (See ARABIA.) His successors conquered in order to establish the religion of their apostle; and thus the very name of Christianity was extinguished in many places where it had formerly flourished. The conquests of the Tartars having brought them in contact with the Mahommedans, they greedily embraced the superstitions of that religion, which thus almost entirely overspread the continents of Asia and Africa; and the conquest of Constantinople by the Turks in 1453 likewise established the faith of the Prophet throughout a considerable part of Europe.

About the beginning of the sixteenth century the Roman pontiffs lived in the utmost tranquillity; nor had they, according to all appearance, any reason at that time to fear an opposition to their authority in any respect, since the commotions which had been raised by the Waldenses, Albigenses, and other sects, were now entirely suppressed. We must not, however, conclude from this apparent tranquillity and security that the measures of the pontiffs were universally applauded. Not only private persons, but even the most powerful princes and sovereign states, exclaimed loudly against the tyranny of the popes, and the unbridled licentiousness of the clergy of all denominations; and they demanded, therefore, a reformation of the church, and the assembling a general council to accomplish that necessary purpose. But these demands were not successful in awakening attention to the full extent of the evil; and though some of the more flagrant abuses were corrected, nothing effectual was done to restore the wholesome rigour of ecclesiastical discipline. Besides, these complaints proceeded from persons who never entertained any doubt respecting the supreme authority of the pope in religious matters, and who consequently, instead of attempting themselves to bring about the reformation which they so ardently desired, remained inactive, looking for redress to the court of Rome, or to a general council. But whilst the reform appeared to be at a great distance, it suddenly arose from a quarter whence it was not at all expected. A single person, Martin Luther, a monk of the order of St Augustin, ventured to oppose himself to the whole weight of papal power and authority. This bold attempt was first publicly made on the 30th of September 1517; and notwithstanding all the efforts of the pope and his adherents, the doctrines of Luther continued daily to gain ground. Others, also, encouraged by his success, lent their assistance in the great and important work of reformation, which at length produced churches, founded upon principles altogether different from that of Rome.

But on this subject it is unnecessary here to enter into particulars. We shall therefore conclude this section with a few remarks on the power of the pope, ecclesiastically considered.

The ecclesiastical power of the pope may be considered under three different aspects: his power and privileges as bishop of the diocese of Rome; his power and privileges as patriarch of the West; and his power, privileges, and rank, as supreme head of the Catholic church. As, however, it is generally in the last capacity that the pope is considered in this country, we may observe, in the first place, that the actual state of the papal power is the same now as it ever was; it can never change, although the exercise of it may vary, and has varied, according to circumstances. The power of the pope, though, in the belief of the Catholic church, universally acknowledged and respected from the beginning, was less felt in the primitive ages, when the lives and circumstances of Christians were such as seldom to call for any other interference than that of their immediate ecclesiastical superiors; but, in proportion as abuses crept in, and disputes, schisms, and heresies arose, this power was exercised with a greater degree of activity, and naturally attracted a greater share of public attention. Hence it was exerted to its fullest extent during those ages of ignorance and anarchy into which Europe was thrown by the invasions of the different hordes of barbarians which followed the breaking up of the Roman empire. But, in proportion as order has been restored, and a greater degree of civilization introduced, the exercise of the power of the pope as head of the Catholic church has become more limited, because its interposition is less called for. In all ages, however, the ecclesiastical power inherent in the pope as head of the Catholic church has been the same, and must ever be so, in the belief of that church, because, according to its creed, the pope holds his power from God, through a continued succession of predecessors downwards, and can transmit to his successors in office neither more nor less than what he has received. Now, the doctrine of the Catholic church on the authority of the pope as its head may be stated, in general terms, to be what it was defined in the tenth session of the council of Florence, viz. "That full power was delegated to the bishop of Rome, in the person of St Peter, to feed, regulate, and govern the universal church, as expressed in the general councils and holy canons."

The doctrine of this council respecting the supremacy of the pope may be stated in the words of Mr Butler, as contained in his *Book of the Roman Catholic Church*, upon the accuracy of which, as far as doctrine is concerned, the most implicit reliance may, we believe, be placed. "It is an article of the Roman Catholic faith," says he, "that the pope has, by divine right, 1*st*, a supremacy of rank; 2*d*, a supremacy of jurisdiction in the spiritual concerns of the Roman Catholic church; and, 3*d*, the principal authority in *defining* articles of faith. In consequence of these prerogatives, the pope holds a rank splendidly pre-eminent over the highest dignitaries of the church; he has a right to convene councils, and preside over them by himself or his legates, and to confirm the election of bishops. Every ecclesiastical cause may be brought before him, as the last resort, by appeal; he may promulgate definitions and formularies of faith to the universal church; and when the general body, or a great majority of her prelates, have assented to them, either by formal consent or tacit assent, all her members are bound to acquiesce in them. 'Rome,' they say, in such a case, 'has spoken, and the cause is determined.' To the pope, in the opinion of all Roman Catholics, belongs also a general superintendence of the concerns of the church; a right, when the canons provide no line of action, to direct the proceedings, and, in extraordinary cases, to act in opposition to the canons. In those spiritual concerns in which, by strict right, his authority is not definitive, he is entitled to the highest respect and deference.”

These are the points which, as there is no dispute about them, are admitted and believed by the Catholic church. As to the different opinions of different divines, every Catholic is at liberty to adopt or reject them, according as his own judgment and reason may dictate. Has the pope a controlling power over the whole church, should she chance to oppose his decrees, and, consequently, over a general council, her representative? Has he the same power, even in ordinary cases, over the canons of the universal church? Has he the power of calling all spiritual causes to his cognisance; of evoking to himself, or to judges appointed by him, any cause actually depending in an ecclesiastical court? Has he the power of constituting and deposing bishops; of conferring all ecclesiastical dignities and benefices, in or out of his dominions, by paramount authority? Is he personally infallible when he undertakes to issue a solemn decision upon any point of faith? In answer to these interrogatories, some say, yes; others say, no. Both opinions are tolerated by the Catholic church; but, according to Butler, neither speaks its faith. As to the question, whether the pope has a divine right to the exercise, indirectly at least, of temporal power, for effecting a spiritual good, it is no longer a subject of discussion, since all parties have acquiesced in the opinion of those who maintained that he has not; a proof of which was given to Mr Pitt in 1788, in the answers which were returned to his questions upon that head by the universities of Louvain, Douay, Sorbonne, Alcala, and Salamanca.

COMPOSITION OF HISTORY.

History has been defined, philosophy teaching by examples. But this definition is too artificial. History may exist apart from philosophy, just as philosophy may exist apart from history. The alliance of these two is natural, but not necessary. History, considered as a faithful record of past experience, is no doubt fertile in instruction; it is a great magazine of facts from which, reasoning inductively, important conclusions may be deduced. But the lights which the experience of the past may be made to supply for the conduct of the future must not in strictness be confounded with the elements or materials out of which they are struck; in other words, it is most desirable to distinguish between the facts which it is the peculiar business of history to record, and the inferences or general truths which they are calculated to evolve. Narration is the primary, philosophising only the secondary object of history. Every thing depends upon the accurate arrangement and detail of events; on preserving unbroken the sequence which nature has established, and, at the same time, distinguishing between mere coincidence in time or in place, and accidental or necessary connection. Hence radical truth is the foundation of history, the only basis upon which a solid superstructure can be reared. But historical truth consists of two parts; first, not to state what is in its own nature false; and, secondly, not to omit any thing which is true, and necessary to place the subject in a clear and proper light. It is possible to tell the truth, and yet to create a most erroneous impression by not telling the whole truth. The most dangerous, because the most insidious, mode of corrupting history and misleading the judgments of mankind, is the suppression or concealment of important circumstances, which, if known, might give a totally different complexion to the actions or events recorded; and, next to this in pernicious effect, is the less glaring but equally dishonest artifice of giving a disproportionate prominence to one feature of a character, or one aspect of a subject, whilst others, which truth requires to be brought out in commensurate fulness and relief, are either thrown into the shade, or so slightly touched as almost to escape observation. Of this last vice, which, more than any other, is calculated to taint the stream of history, Gibbon, in his narrative of the progressive diffusion of Christianity, presents a notorious and highly censurable example; exaggerating the faults, follies, and errors of the early professors of that faith, without making any account of their heroic fortitude under suffering and persecution, and reserving all his sympathies for material grandeur and barbaric splendour, whilst moral greatness is treated with cold indifference or sarcastic disdain.

But whilst strict truth is thus the grand and sole object of history, or that which distinguishes it from romance on the one hand, and mere party declamation on the other, it must be confessed that nothing is of more difficult attainment, and that the highest faculties of the human mind, moral as well as intellectual, are essentially requisite to him who enters upon the search of it with a view to enlighten and instruct mankind. On all subjects with which the interests, the passions, and the prejudices of men naturally connect themselves, and which are consequently viewed by different observers through different media, we must of course be prepared to expect not only the most opposite opinions, but also the most discordant statements; what is solemnly affirmed by one party or class will be denied with equal emphasis by another; the same event will be presented under the most incongruous aspects, the same character delineated in the most opposite colours; what is found in one authority may be sought for in vain in another; what this writer represents as of the last importance, another may treat as of no moment whatever; whilst the misconceptions of ignorance, uniting with the honest prejudices of party, and the studied misrepresentations of interest or artifice, lend their aid to augment the difficulties and embarrassments which obstruct the search for truth in this entangled and bewildering region. Seeing, then, that it is from such materials that history must be written, it will not be difficult to form a general estimate of the qualities which are essential to constitute an historian in the only just sense of the term. It is not merely necessary that he should be without bias himself, but that he should be capable of making due allowances for all the leanings and prejudices, whether religious, political, or national, which are calculated more or less to affect the judgments and opinions of other men. He must possess an intimate acquaintance with the laws of evidence, or those tests by the application of which the quality or value of evidence, of whatever description, may be ascertained and determined. To extract the truth from a mass of conflicting testimony is one of the most refined and difficult operations which the human mind can be called to perform. It implies patient research, vigilant attention, careful comparison, nice discrimination, prompt perception, and an aptitude for pursuing to their consequences all sorts of investigations, whether direct or collateral; yet this operation the historian, like the judge before whom issues of fact are sent to be tried, is continually required to perform, and that too in circumstances often far more difficult and complicated. The cases which come before the judge arise, for the most part, out of recent occurrences, in the investigation of which many facilities are supplied; those which the historian is called to unravel are frequently overshadowed by the obscurity, and perplexed by the accumulated misrepresentations, of ages. Judicial inquiries commonly relate to a single transaction or set of transactions connected with the ordinary affairs of human life, in which all have more or less experience. Historical researches frequently embrace systems of polity or religion, by which not merely the opinions, but the

Composition of History.

destinies of mankind, may have been powerfully affected, either for good or for evil: they comprehend government, laws, commerce, agriculture, arts, sciences, in different states of advancement, with those mighty changes in the fortunes of nations which are effected by war and revolutions, as well as the more gradual modifications superinduced on society by the slow and silent operation of physical, moral, and political causes. The judge plays his part upon a narrow theatre, where his business is merely to unravel a little plot, all the circumstances of which are, in general, brought pretty fully before him. The historian has to explore, and, as it were, map out, an entire country, to unfold a thousand mysteries, to correct a vast multiplicity of errors, and to puzzle his way through the gloom of an obscure and entangled region, where the landmarks are few, and often calculated to mislead.

From all this, then, it will not be difficult to form a general idea of the duties of an historian, as well as of the qualities and accomplishments which are indispensable to fit him for discharging them in a proper manner. The first, and by far the most important of these, is laborious research and patient investigation. Many of the most gifted men who have applied themselves to the composition of history, have not only failed to attain the truth, but have adopted and given currency to falsehood, because they wanted the perseverance necessary for discovering the one and detecting the other. Of this Hume presents a conspicuous and instructive example. That he was deeply prejudiced is known to all; but his indolence has proved infinitely more detrimental to his historical reputation than even his partiality; it has betrayed him into errors the most gross, and led him to commit injustice the most scandalous. The very authorities to which he refers frequently disprove his statements, and others within his reach would have enabled him to discover the truth if he had been at the pains to seek for it, as well as to correct the errors which he had committed. But he was careless of facts, or at least shrunk from the labour necessary to ascertain them; in general he took the statements of the writers upon his own side as he found them, and, without examination or comparison, scrupled not to hold up to derision and contempt some of the purest and brightest names in English history. He misapplied his great talents, and threw around the grossest perversions of English history all the fascination of his delightful style, and sometimes also the attraction of a profound philosophy. His authority as an historian, however, has been rudely shaken by the searching criticism of Mr Brodie, who, in exposing the errors and misrepresentations of Hume, has, at the same time, done justice to the illustrious men, maligned and defamed by the apologist of the house of Stuart. As a further illustration of his carelessness, if not bad faith, we may refer to Mr Tytler's *Life of Sir Walter Raleigh*, in which it is conclusively shown that Hume might, from the very authorities to which he has referred, have discovered the falsehood of the charges which he has brought against that illustrious but unfortunate victim of royal injustice, whose memory he has sought to load with unmerited obloquy. In this case, the truth was at his hand, had he given himself the smallest trouble to look for it.

The next quality which we shall mention as essential to an historian is strict probity. We do not mean to affirm that prejudice is necessarily dishonest, however much it may tend to blind the understanding and warp the judgment. Where it is avowed or manifest, the reader is thereby put on his guard, and, being forewarned, is seldom deceived. But there is a species of dishonesty which tends more than any other to corrupt the purity of history, yet, by reason of its latent and insidious character, frequently escapes detection, and indeed can seldom be exposed by definite arguments. We refer particularly to the artifice by which the whole gist and bearing of a narrative is insensibly inclined, in favour perhaps of the very individual whose vices or crimes are occasionally exposed with ostentatious fairness and candour, though seldom without the charitable suggestion of some palliating or mitigating circumstance to qualify the sentiments which the statement itself is calculated to awaken. Take, for instance, the history of Scotland by Dr Robertson. In that eloquent and masterly performance, the vices, follies, and crimes of Queen Mary are neither concealed nor directly extenuated; and subjoined to it there is a dissertation on the murder of Darnley, in which the question of her guilty participation in that atrocious crime is for ever put to rest. But notwithstanding all this, the general tendency and effect of the work is decidedly in her favour; and, when the final balance is struck, the remembrance of her guilt is absorbed in sympathy for her misfortunes. We are suffered gradually to lose sight of the one, and are continually reminded of the other. She is, in fact, the heroine of the story, in whom all the interest ultimately centres. By an insensible transition, the criminal, who had dishonoured her station and her sex, is converted into a victim and a martyr. We see before us only an injured queen, who, after an imprisonment of unexampled duration, is at length dragged forth to end her sufferings and her sorrows on the block. The understanding, in fact, is misled through the heart, and the moral judgment is perverted by artfully calling into play some of the best feelings of humanity. Now, in a romance, all this might be highly fitting and proper, because there the grand object is to interest us deeply in favour of the fortunes of the principal personage displayed on the canvass of the romancer. But in a work of history, truth should be exhibited in severe and stern simplicity, not dressed in the fairy attire of fiction, or concealed under the trappings and pageantry of worldly greatness. If an erroneous impression be deliberately and artfully produced, it matters little, in a question of historical probity, how or by what means that is effected; but it may be truly said that honest and avowed prejudice is immeasurably less injurious to the cause of truth than those ingenious but insidious devices which, like that here mentioned, array the feelings against the judgment, and call forth the emotions of the heart, only to counteract the perceptions of the understanding.

Cicero has laid it down that an accomplished orator should be possessed of almost universal knowledge. The same thing applies with much greater force to the historian, who has to treat of almost every subject which is interesting or important to mankind; science, philosophy, legislation, government, religion, war, commerce, art, and industry. On this standard Gibbon laboured for years to form himself, and it must be confessed that, in the acquisitions necessary for the performance of the mighty task which he had prescribed to himself, he stands almost alone amongst modern historians. His learning was equally varied and profound, and the more it is explored the higher will be the estimate formed, not only of the extent of his treasures, but also of the judgment and skill with which these are almost invariably brought to bear upon the subject before him, whatever it may be. Nor has his example proved fruitless or unavailing. The cultivation of the historical sciences, which had so long been neglected, has latterly engaged the attention and occupied the labours of some of the first minds in Europe; of men who, to the investigations which such pursuits render necessary, have brought all the resources of deep learning and original thought, of profound philosophy, and an intimate acquaintance with the true interests of states. In the hands of Von Hammer light has been shed on many of the darkest passages of Ottoman history; Heeren has traced, with great clearness, sagacity, and learning, the intercommunications of ancient nations, and the routes pursued by ancient commerce; and Niebuhr, having dissipated the mist of fable and romance which overshadowed the early history of Rome, has reduced the exaggerations of chroniclers and poets to their true dimensions, and laid a foundation for all ages, though, unfortunately, without being permitted to raise the superstructure. Michaud's *Histoire des Croisades* is also a work of extensive research and profound investigation, in which the various resources afforded by the science of criticism have been employed to rectify errors, and to shed a new and steady light on what was formerly obscure; whilst new views or new facts, derived from sources previously unexplored, are unfolded in almost every page. It is thus that history ought to be written, if intended to be instructive. By applying the powerful instrument of an enlightened and philosophical criticism, we shall no doubt dispel almost every ingredient allied to the marvellous, and sadly disenchant the gorgeous creations of romance; but truth, in her divine simplicity, will remain to atone for the destruction of these airy and unsubstantial fabrics, and to command the respect and homage of enlightened worshippers. We have fallen upon an utilitarian age, when men, having ceased to pursue shadows, seek for the substance of knowledge, when glitter and tinsel are disregarded, when amusement is sought through the medium of instruction, and when nothing is considered as agreeable which is altogether useless. Besides, as mankind rise in political importance, and feel that they have rights to exercise, interests to advance, and privileges to defend, their desire to seek lessons for the future in the experience of the past receives a corresponding increase; they lose their relish for romance, and acquire a taste for simple, unadulterated truth, which is alone calculated to extend their knowledge and promote their happiness.

History of Nature, or *Natural History.* See Natural History.

HISTRIO, in the ancient drama, signified an actor or comedian; but more especially a pantomime, who exhibited his part by gestures and dancing. Livy informs us that the histriones were brought to Rome from Etruria, in the year of the city 391.

HIT, a village of Irak Arabia, situated on a river of the same name, which is a tributary of the Euphrates. There are abundant pits of bitumen in the neighbourhood, from which it is supposed that supplies were derived for the construction of ancient Babylon.

HITCHEN, a town in the county of Hertford, which gives its name to the hundred, thirty-four miles from London. It was once of some note for its manufactures, but none is left except that of making malt. It is a well-built town, with a good market held on Tuesday, at which much corn is sold. The inhabitants amounted in 1801 to 3161, in 1811 to 3608, in 1821 to 4486, and in 1831 to 5211.

HITTITES, the descendants of Heth. See Heth.

HIVE, a convenient receptacle for bees. See Bee.

HIVITES, a people descended from Canaan, who dwelt at first in the country afterwards possessed by the Caphtorims or Philistines.

HOADLY, Benjamin, successively bishop of Bangor, Hereford, Salisbury, and Winchester, was born in the year 1676. His first preferment in the church was to the rectory of St Peter-le-Poor, and the lectureship of St Mildred's in the Poultry. In the year 1706 he published some remarks on Bishop Atterbury's sermon at the funeral of Mr Bennet, in which Dr Atterbury had, in the opinion of Mr Hoadly, laid down some dangerous propositions. Two years afterwards Mr Hoadly again entered the lists against this formidable antagonist; and in his exceptions against a sermon published by Dr Atterbury, entitled The Power of Charity to cover Sin, he attacked the doctor with his usual strength of reasoning and dispassionate inquiry. In 1709 another dispute arose between these two learned combatants concerning the doctrine of non-resistance, occasioned by a performance of Mr Hoadly's, entitled the Measures of Obedience; some positions in which Dr Atterbury endeavoured to confute in an elegant Latin sermon which he preached that year before the London clergy. In this debate Mr Hoadly signalised himself in so eminent a degree, that the House of Commons conferred on him a particular mark of respect, by representing, in an address to the queen, the signal services he had done to the cause of civil and religious liberty. The principles which he espoused, however, being repugnant to the general temper of those times, drew on him the virulence of a party; yet it was at this period, 1710, when, as he himself expressed it, fury seemed to be let loose upon him, that Mrs Howland presented him to the rectory of Streatham in Surrey, unasked, unapplied to, and without his ever having seen his benefactress. Soon after the accession of King George I. Mr Hoadly was consecrated to the see of Bangor; and, in 1717, having broached some opinions concerning the nature of Christ's kingdom, he again became the object of popular clamour. At this juncture he was distinguished by a particular mark of the royal regard, inasmuch as the convocation was successively prorogued, nor was it permitted to sit, or to do any business, until that resentment had entirely subsided. In 1721 he was translated to Hereford; and from thence, in 1723, to Salisbury. In 1734 he was, on the demise of Dr Willis, translated to Winchester, and published his Plain Account of the Sacrament; a performance which served as a butt for his adversaries to shoot their arrows at, yet impartiality must own it to be clear, rational, and manly, written with candour and judgment, and suited to the capacity of every serious and considerate inquirer after truth. His latter days were embittered by an instance of fraud and ingratitude. The bishop took under his protection a French priest, who pretended to abjure his religion, and who had no other recommendation than that of his necessities. In return for this act of humanity, the priest found an opportunity of getting the bishop's name written by his own hand, and, causing a note of some thousand pounds to be placed before it, offered it in payment. But the bishop denying it to be his, it was brought before a court of justice, and was there found to be a gross imposition. The ungrateful villain had now recourse to a pamphlet, in which he charged the bishop with being a drunkard; and alleged that he had received the note from him when he was in liquor. To this calumny the bishop made a full and nervous answer, in which he exposed the man's falsehood, and solemnly averred that he was never drunk in his whole life. The world with becoming ardour embraced his defence, and he had the happiness to find himself perfectly acquitted even of any suspicion of such a charge. As a writer, he possessed uncommon abilities. But his style was defective and cumbrous, owing to the extreme length of his periods. His sermons, published in 1754 and 1755, are esteemed inferior to few writings in the English language, for plainness and perspicuity, energy and strength of reasoning, and a free and masterly manner. In private life he was naturally facetious, easy, and complying; and, though fond of company, accustomed frequently to retire for the purposes of study or devotion. He was everywhere happy, and particularly in his own family, where he took all opportunities of instructing by his influence and example. Bishop Hoadly died in 1761, aged eighty-three. Besides the works already mentioned, he wrote, 1. Terms of Acceptance, 8vo; 2. Reasonableness of Conformity; and 3. On the Sacrament. His tracts and pamphlets are extremely numerous. A complete edition of his works, in three volumes folio, was published by his son Dr John Hoadly, in 1773, with a short life of the author prefixed. The appendix to this edition contains some portion of his correspondence with Lady Sundon, formerly Mrs Clayton, bed-chamber woman to Queen Anne, and a person to whom he appears to have been chiefly indebted for his influence at court.

Hoadly, *Benjamin*, son of the former, was born in 1706, and studied at Bennet College, Cambridge, under the tuition of Dr Herring, afterwards archbishop of Canterbury. He took his degree in physic; and having, when young, applied himself to mathematical and philosophical studies, he was admitted a member of the Royal Society. He was made registrar of Hereford whilst his father filled that see, appointed physician to his majesty's household, and died at his house in Chelsea in 1757. He wrote, 1. Three letters on the Organs of Respiration, 4to; 2. The Suspicious Husband, a comedy; 3. Observations on a series of Electrical Experiments; 4. Oratio Anniversaria, in Theatro Col. Med. Londin. ex Harvei instituto habita 1742.

HOAIN-Gan-Foo, a large city of China, in the province of Kiangnan, situated on the bank of the great canal, which is above the level of the city, and occasions perpetual danger of inundation. It occupies a large area, including gardens and cultivated grounds; and, from the crowds of spectators seen by the British embassy, it seemed as if there was a numerous population. Long. 118. 47. E. Lat. 53. 30. N.

HOANGHO, or Yellow River, a great river of China, which has its rise in the unknown and mountainous regions of Thibet, probably the loftiest portion of the Asiatic continent. The Hoangho, after entering China, turns to the north, and flows even beyond the limits of the empire. But after winding for a short time, it re-crosses the frontier, and spreads fertility over some of the finest provinces of China. It falls into the Yellow Sea about the thirty-fourth degree of north latitude, at no very great distance from the Yang-tse-Kiang or Blue River, another of the vast streams by which China is watered. The course of the Hoangho is estimated, though with some uncertainty, to be in length about 1800 British miles. Though broad and rapid, it is in many places so shallow as to be unfavourable for navigation. It is also liable to overflow its banks; and it has been found necessary, in consequence, to protect the surrounding country against its inroads, by means of dikes and mounds.

HOARSENESS, in *Medicine*, a diminution of the voice, commonly attended with a great asperity and roughness of intonation. The parts usually affected are the arteria aspera and the larynx.

HOBAL, in *Mythology*, an idol of the ancient Arabs, the worship of which at Mecca was destroyed by Mahommed.

HOBBES, Thomas, a metaphysical and political writer of the greatest eminence, was born at Malmesbury on the 5th of April 1588. He was the son of a clergyman; and having completed his studies at Oxford, he was appointed governor to the eldest son of William Cavendish, earl of Devonshire. He travelled with that young nobleman through France and Italy, and at length applied himself entirely to the study of literature. He translated Thucydides into English, and in 1628 published his translation, in order to show his countrymen, from the Athenian history, the disorders and confusions of a democratical government. In 1626 his patron the Earl of Devonshire died, and in 1628 the earl's son also died; a loss which affected Mr Hobbes to such a degree, that he willingly accepted an offer made him of going abroad a second time with the son of Sir Gervase Clifton, whom he accordingly accompanied to France. But whilst he resided there, he was solicited to return to England, and resume his charge of the hope of that family to which he had so early attached himself. In 1631 the Countess Dowager of Devonshire desired to put under his care the young earl, who was then about the age of thirteen. This proved agreeable to the inclinations of Mr Hobbes, who discharged the trust with great diligence and fidelity. In 1634 he republished his translation of Thucydides, and prefixed to it a dedication to that young nobleman, in which he gives a high character of his father, and represents in the strongest terms the obligations he was under to the Devonshire family. The same year he accompanied his pupil to Paris, where he applied his leisure hours to the study of natural philosophy, and more especially to the understanding of mechanism, and the causes of animal motion. Upon these subjects he had frequent conversations with Father Mersenne, a man deservedly celebrated, and who maintained a correspondence with almost all the learned in Europe. From Paris he accompanied his pupil to Italy, where, on visiting Pisa, he became known to Galileo, who freely communicated to him his discoveries; and after having seen all that was remarkable in that country, he returned with the Earl of Devonshire to England. Afterwards, foreseeing the civil wars, he went to seek a retreat at Paris, where, by the good offices of his friend Father Mersenne, he became known to Descartes, and afterwards corresponded with him upon several mathematical subjects, as appears from the letters of Mr Hobbes published in the works of Descartes. But when this philosopher afterwards printed his Meditations, in which he attempted to establish points of the highest consequence, on the assumption of innate ideas, Mr Hobbes took the liberty of dissenting from him; and so also did Gassendi, with whom Mr Hobbes contracted a very intimate friendship, which was not interrupted till the death of the former. In 1642 Mr Hobbes printed a few copies of his book *De Cive*, which, in proportion as it became known, raised him many adversaries, who charged him with instilling principles which had a dangerous tendency. Amongst many illustrious persons who, upon the shipwreck of the royal cause, retired to France for safety, was Sir Charles Cavendish, brother of the Duke of Newcastle; and this gentleman, being skilled in every branch of the mathematics, proved a constant friend and patron of Mr Hobbes, who, having in 1645 embarked in a controversy about squaring the circle, became so celebrated, that in 1647 he was recommended to instruct the Prince of Wales, afterwards Charles II., in mathematical learning. His diligence in the discharge of this office gained him the esteem of that prince; and though he afterwards withdrew his public favour from Mr Hobbes on account of his writings, yet he always retained a sense of the services which the latter had rendered him, showed him various marks of favour after the Restoration, and, as some say, had his picture suspended in his closet. This year also was printed in Holland, under the care of Sorbière, a second and more complete edition of the treatise *De Cive*, to which are prefixed two Latin letters to the editor, the one by M. Gassendi, the other by Father Mersenne, in commendation of it; and in 1650 was published at London his small but profound and original treatise on Human Nature, with another *De Corpore Politico*, or on the Elements of the Law.

All this time Mr Hobbes had been occupied in digesting his religious, political, and moral principles into a complete system, which he called *Leviathan*, and which was printed in English at London in 1650 and 1651. After the publication of his *Leviathan* he returned to England, and passed the summer commonly at the seat of his patron the Earl of Devonshire, in Derbyshire, and spent some of his winters in town, where he had as his intimate friends some of the greatest men of the age. Upon the occurrence of the Restoration in 1660, he repaired to London, where he obtained from the king assurance of protection, and had an annual pension of L.100 settled upon him out of the privy purse. Yet even this did not render him entirely safe; for, in the year 1666, his *Leviathan* and his treatise *De Cive* were censured by parliament; a circumstance which, taken in connexion with the bringing in of a bill into the House of Commons to punish atheism and profaneness, gave him serious alarm. When the storm had blown over, however, he began to think of publishing a beautiful edition of his pieces in Latin; but finding this impracticable in England, he caused it to be undertaken abroad, where they were published in three volumes quarto in 1668, from the press of John Bleau. In 1669 he was visited by Cosmo de' Medicis, then prince, and afterwards Duke of Tuscany, who gave him ample proofs of esteem and respect, and having received his picture, with a complete collection of his writings, caused them to be deposited, the former amongst his curiosities, and the latter in his noble library at Florence. He received similar visits from foreign ambassadors and other strangers of distinction, who were curious to see a person whose singular opinions and numerous writings had made so much noise all over Europe. In 1672 he wrote his own life in Latin verse, when he had completed his eighty-fourth year; and, in 1674, he published, in English verse, four books of Homer's Odyssey, which was so well received, that it encouraged him to undertake the whole Iliad and Odyssey, both of which he translated and published in 1675. About this time he took leave of London, and went to spend the remainder of his days in Derbyshire. He died on the 4th of December 1679, aged ninety-two.

As to his deportment and manners, they are thus described by Dr White Kennet, in his Memoirs of the Cavendish family. "The Earl of Devonshire," says he, "for his whole life entertained Mr Hobbes in his family, as his old tutor rather than as his friend or confidant. He let him live under his roof in ease and plenty, and in his own way, without making use of him in any public, or so much as domestic affairs. He would frequently put off the mention of his name, and say, 'He was a humorist, and nobody could account for him.' There is a tradition in the family, of the manners and customs of Mr Hobbes, somewhat observable. His professed rule of health was to dedicate the morning to his exercise, and the afternoon to his studies. And therefore, at his first rising, he walked out, and climbed any hill within his reach; or, if the weather was not dry, he fatigued himself within doors by some exercise or other, to be in a sweat; recommending that practice upon this opinion, that an old man had more moisture than heat, and therefore by such motion heat was to be acquired and moisture expelled. After this, he took a comfortable breakfast; and then went round the lodgings to wait upon the earl, the countess, and the children, and any considerable strangers, paying some short addresses to all of them. He kept these rounds till about twelve o'clock, when he had a little dinner provided for him, which he ate always by himself without ceremony. Soon after dinner he retired to his study, and had his candle, with ten or twelve pipes of tobacco laid by him; then shutting his door, he fell to smoking, thinking, and writing for several hours. He retained a friend or two at court, and especially the Lord Arlington, to protect him if occasion should require. He used to say, that it was lawful to make use of ill instruments to do ourselves good: 'If I were cast,' says he, 'into a deep pit, and the devil should put down his cloven foot, I would take hold of it to be drawn out by it.' After the Restoration, he watched all opportunities to ingratiate himself with the king and his prime ministers; and looked upon his pension to be more valuable, as an earnest of favour and protection, than upon any other account. His future course of life was to be free from danger. He could not endure to be left in an empty house. Whenever the earl removed, he would go along with him, even to his last stage, from Chatsworth to Hardwick. When he was in a very weak condition, he dared not to be left behind, but made his way upon a feather-bed in a coach, though he survived the journey but a few days. He could not bear any discourse of death, and seemed to cast off all thoughts of it. He delighted to reckon upon longer life. The winter before he died, he made a warm coat, which he said must last him three years, and then he would have such another. In his last sickness his frequent questions were, Whether his disease was curable? and when intimations were given that he might have ease, but no remedy, he used this expression, 'I shall be glad to find a hole to creep out of the world at;' which are reported to have been his last sensible words; and his lying some days following in a silent stupefaction, did seem owing to his mind more than to his body."

Lord Clarendon says of him, that he "was a man for whom he had a great esteem, and who was always regarded as a person of probity, and of a life free from scandal." As to his character as a philosopher and political writer, it is only necessary here to refer to the admirable sections regarding him in the Dissertations by Mr Stewart and Sir James Mackintosh, prefixed to this work. A collection of his "moral and political" writings, comprised in a folio volume, was published at London in the year 1750.

HOBGOBLIN is a name vulgarly applied to spectres or apparitions. Skinner calls the word *robgoblins*, and derives it from Robin Goodfellow, Hob being the nickname of Robin; but Wallis and Junius, with greater probability, derive it from *hopgoblins*, because they are supposed to hop without moving both their feet.

HOBLERS, or HOBILERS, *Hobelarii*, in our ancient customs, were men who, by their tenure, were obliged to maintain a light horse or hobby, for announcing any invasion from the seaward. The name was also employed to signify certain Irish knights, who used to serve as light horsemen upon hobbies.

HOB-NAIL, a nail with a thick strong head, used in shoeing a hobby or little horse.

HOB-NOB, or HAB-NAB, a cant word formed from *hap ne hap*, and denoting an event which happens at random, or by mere chance.

HOBSON'S CHOICE, a vulgar proverbial expression, applied to that kind of choice in which there is no alternative. It is said to be derived from the name of a carrier at Cambridge, who let out hackney horses, and obliged each customer to take in his turn that horse which stood next the stable door.

HOCHHEIM, a market-town of the duchy of Nassau, in Germany, the capital of a bailiwick of the same name. It stands on an elevated spot, at the junction of the Nidda with the Maine. It contains a church, and 440 houses, with 1850 inhabitants. The neighbourhood is celebrated for producing the best wines of the Rhine, which have generally been known in England by the name of Hock. That of peculiar excellence is, however, the growth of a particular vineyard, which is not more than ten acres in extent, and sells, even when new, at a very high price.

HOCHOU, a walled city of China, in the province of

Kiangnan, about three miles from the banks of the Yang-tse-Kiang. It appears to be about three or four miles in circuit, and to have been at one time more populous than at present. The country around is highly cultivated. It is thirty miles south-west of Nanking. Long. 118. 14. E. Lat. 29. 57. N.

HOCHSTEDT, a town of Bavaria, the capital of the bailiwick of the same name in the circle of the Upper Danube. It stands on the Danube, and contains two churches, 396 houses, and 2240 inhabitants. It is celebrated as the scene of one of Marlborough's most splendid victories gained in 1704, and as the field of defeat of the Austrians by the French in 1800. Long. 10. 28. 25. E. Lat. 48. 36. 30. N.

HOCUS POCUS, a cant expression, with which the exhibitors of legerdemain tricks generally prefaced their feats. This term is supposed to be a corruption of the words *hoc est corpus*.

HOD, a sort of tray for carrying mortar, in use among bricklayers.

HODDESDON, a town of the county of Hertford, in the parishes of Amwell and Brockborn, seventeen miles from London. It stands on the river Lea, and on the great road to the eastern counties. It consists of one long street, in the middle of which is a fountain that supplies the town with water. There is a market which is held on Wednesday. The inhabitants amounted in 1801 to 1221, in 1811 to 1249, in 1821 to 1354, and in 1831 to 1615.

HODMAN, a cant term formerly used for a young scholar admitted from Westminster school to be student in Christ Church in Oxford.

HODNET, a town, or rather a parish, in the hundred of North Bradford, in the county of Salop, on the river Terne, 135 miles from London. It is only remarkable as the birth-place and residence of the late Bishop of Calcutta, Heber. The inhabitants amounted in 1801 to 1386, in 1811 to 1499, in 1821 to 1795, and in 1831 to 1769.

HODY, Humphry, an eminent English divine, was born at Odcombe, in Somersetshire, on the 1st of January 1659. Whilst yet a boy he discovered a strong propensity to learning, and in 1676 was admitted into Wadham College, Oxford, of which he was chosen fellow in 1684. At the age of twenty-one he published his Dissertation against the History of the Seventy-two Interpreters by Aristeas. In this production Hody shows that the story told by Aristeas as to the occasion of the Septuagint translation is the invention of some Hellenist Jew; that it is full of blunders and anachronisms; and that it was originally circulated on purpose to recommend the Greek version of the Old Testament. This dissertation was received with much approbation by the learned, excepting Isaac Vossius, who having espoused the contrary, could not endure to see a mere youth enter the lists against one of his age and reputation in letters. He therefore published an appendix to his Observations on Pomponius Mela, containing an answer to Hody's Dissertation, in which, neglecting arguments, he contents himself with indulging in the utmost petulance and scurrility towards his opponent. In 1704, Hody published his four books *De Bibliorum textis originalibus, versionibus Græcis, et Latina Vulgata*; the first containing his dissertation on Aristeas's history, the second treating of the true authors of the Greek version called the Septuagint; the third comprising a history of the Hebrew text, the Septuagint version, and the Latin Vulgate; and the fourth giving an account of the other Greek versions, namely, those of Symmachus, Aquila, and Theodotion, with the *Hexapla* of Origen, and other ancient editions. In 1689, Hody wrote the Prolegomena to the Chronicle of John Malela, printed at Oxford; and in 1690 he was made chaplain to Stillingfleet, bishop of Worcester. The deprivation of the nonjuring bishops involved him in a controversy with Mr Dodwell, and gave occasion to a number of polemical pieces, which have long ceased to possess any interest. The part which he took in this controversy, however, recommended him to Archbishop Tillotson, who appointed him his domestic chaplain, an office which he continued to hold under Dr Tennyson, Tillotson's successor. In 1698 he was appointed regius professor of Greek in the university of Oxford, and in 1704 he was instituted to the archdeaconry of the same place. But he did not long survive these preferments, having died on the 20th of January 1705. Hody left behind him in manuscript a valuable work, comprising the substance of his lectures as professor, and containing an account of those learned Greeks who retired to Italy before and after the taking of Constantinople by the Turks, and there revived the study of the language and literature of Greece, which had long been entirely neglected. This work was published in 1742 by Dr Jebb, and entitled *De Græcis Illustribus linguæ Græcæ literarumque humaniorum instauratoribus, eorum vitis, scriptis, et elogiis libri duo*; prefixed to which is an account in Latin of the author's life, extracted from a manuscript in English left by himself. (A.)

HOE, or How, a husbandman's tool, made like a cooper's adze, to cut up weeds in gardens, fields, &c.

HOF, a city of Bavaria, in the circle of Upper Maine. It is situated on the river Saale, is surrounded with walls, and is the seat of the revenue officer of the circle. It contains four churches, an orphan-house, an hospital richly endowed, and 650 houses, with 5730 inhabitants, who find occupation in manufactures of woollen, linen, and cotton goods, and in breweries, distilleries, and paper-making.

HOFFMANN, John James, a celebrated philologist, was born at Basil in 1635. His father, who was professor of law in the academy of that city, inspired him betimes with a taste for application, and directed his early studies. Young Hoffmann went through his courses of philosophy and theology with distinction, and was ordained to the holy ministry. But as the delicacy of his health did not admit of his pursuing that career, he applied himself to teaching; and after having, for several years, given private instructions, he was, in 1667, appointed to the chair of Greek in the academy, whence he was, in 1683, translated to that of history, the duties of which he discharged with indefatigable zeal until his death, which occurred in 1706, without his having ever quitted his native country. The best known of all his works is the *Lexicon Universale, Historico-Geographico-Chronologico-Poetico Philologicum*, Basil, 1677, in two volumes folio, with a Supplement, also in two volumes, 1683. The work at first met with indifferent success. This dictionary is constructed upon a very extensive plan; but all the parts leave much to be desired. The articles on ancient geography are considered as the best; those on history are superficial and inaccurate. The title of the book announces various synonymes of geographical names derived from twenty different languages; but the execution does not come up to the announcement. The author omits no opportunity to declaim against the Catholic religion and against France. The other works of Hoffmann are, 1. Numerous Theses on subjects of little or no interest; 2. A Collection of Poems, *Poemata*, Basil, 1684, in 12mo; 3. Epitome metrica Historiæ Universalis civilis et sacræ ab orbe condito, ibid. 1686, in 12mo; 4. Historia Paparum, 1687, in two vols. 12mo; 5. Two Memoirs on the *Miscellanea Berolinensia*. (A.)

Hoffmann, *Frederick*, a celebrated physician of the university of Halle in Saxony, was born in that city in 1660. He received his early education in his native town, and made great progress in the mathematics, which his parents had caused him to study, and to which he ascribed advances in the study of medicine. At the age of fifteen he lost both his father and his mother during the prevalence of an epidemical distemper. In 1680, he established himself at Erfurt, there to study chemistry under Gaspar Cramer, and the following year he received the degree of doctor of physic at Iena. In 1682, he published an Essay *De Cinnabari Antimonii*, which was reprinted at Leyden in 1685, 12mo, and laid the foundation of his reputation as an able chemist, which he afterwards increased by professing chemistry in the schools of Iena. It is to him we are indebted for the preparation known by the name of the Anodyne Liquor of Hoffmann, which is considered as one of the best sedatives. Frederick III. elector of Brandenburg, having founded the university of Halle in 1693, Hoffmann was appointed primarius professor, and alone prepared the statutes of the faculty of medicine. His fame soon spread throughout all Germany, and thence into foreign parts; and several learned bodies, including the academies of Berlin and Petersburg, and the Royal Society of London, enrolled him among their members. During his residence at Halle he divided his time between instruction, practice, and study; but more than once he interrupted his pursuits by visits to the different courts of Germany, where his professional successes procured him honours, titles, and rewards. He was solicited by the king of Prussia to fix his residence at Berlin; but he preferred remaining in his native country, where he died on the 12th of November 1742. At the age of sixty Hoffmann undertook his great work entitled *Medicina Rationalis Systematica*, Halle, 1730, in nine vols. 4to, of which Bruhier d'Ablaincourt has given a translation under the title of *Médécine Raisonnée d'Hoffmann*, 1739, in nine vols. 12mo. The same physician has also translated from the Latin of Hoffmann, a Treatise on Fevers, Paris, 1746, in three vols. 12mo; the Politics of Medicine, ibid. 1751, in 12mo; and Observations on the Cure of Gout and Rheumatism. A complete edition of his works has been published, with a life of the author, under the title of *Hoffmanni Opera omnia Medico-physica cum Supplementis*, Geneva, 1740, 1755, eleven parts, in folio. The writings of Hoffmann contain a great mass of practical matter of considerable value, partly compiled from preceding writers, and partly the result of his own observation; but they are also deformed by trifling remarks, hypothetical conjectures, and frequent prolixity and repetition in the details. As a theorist, his suggestions proved of great importance, and contributed to introduce that revolution in the science of medicine which subsequent observation has extended and confirmed. His doctrine of atony and spasm in the living solid, according to which all internal disorders were referred to some preternatural affection of the nervous system, rather than to the morbid derangements of the fluids, first turned the attention of physicians from the mere mechanical and chemical operations of the body, to those of the primary moving powers of the living system. Hoffmann pursued with considerable ardour the study of practical chemistry, and improved the department of pharmacy by the addition of some mineral preparations. But, upon the whole, his practice was cautious, especially in his latter years; and he trusted much to vegetable simples. "I affirm solemnly," said he, "that though in my youth I ran much after chemical remedies, yet, in my age, I became convinced that very few remedies, well selected, and derived from substances in appearance the most worthless, afford more prompt and efficacious relief to the sick than the rarest and most elaborate chemical preparations." (A.)

HOFFMANNISTS, in *Ecclesiastical History*, are those sectaries who espoused the sentiments of Daniel Hoffmann, professor in the university of Helmstadt, who maintained that philosophy was a mortal enemy to religion, and that what was true in philosophy was false in theology. These absurd and pernicious tenets occasioned a warm controversy; but Hoffmann was at length compelled by Julius duke of Brunswick to retract his invectives against philosophy, and to acknowledge, in the most open manner, the harmony and union of sound philosophy with true and genuine theology.

HOFGEISMAR, a city of the principality of Hesse Cassel, in the province of the Lower Hesse. It is on the river Esse, is walled, and has two churches, an hospital, and stadthouse, with 420 dwellings, and 2586 inhabitants.

HOG. See MAMMALIA.

HOG ISLE. There are two small islands of this name in the Eastern Seas, one about twenty miles in circumference, lying off the north-eastern extremity of Java. Long. 114. 55. E. Lat. 7. 5. S. This is also the name of another island, sixty miles off the west coast of Sumatra, about forty miles in length, and three in average breadth.

HOGARTH, WILLIAM, an artist, a truly great and original genius, was born in 1697 or 1698, in the parish of St Martin, Ludgate. The outset of his life, however, was unpromising. "He was bound," says Lord Orford, "to a mean engraver of arms on plate." Hogarth probably chose this occupation as it required some skill in drawing, to which his genius was particularly turned, and which he contrived assiduously to cultivate. His master was Mr Ellis Gamble, a silversmith of eminence, who resided in Cranburn Street, Leicester Fields. In this profession it is not unusual to bind apprentices to the single branch of engraving arms and ciphers on every species of metal; and in that particular department of the business young Hogarth was placed; but, before his time had expired, he felt the impulse of genius, and it directed him to painting. During his apprenticeship, he set out one Sunday, with two or three companions, on an excursion to Highgate. The weather being hot, they went into a public house, where they had not been long before a quarrel arose between some persons in the same room, and one of the disputants having struck the other on the head with a quart pot, cut him very much. The blood running down the man's face, together with the agony of the wound, which distorted his features into a most hideous grin, presented Hogarth, who showed himself thus early sensible of the course which Nature had intended he should pursue, with too laughable a subject to be overlooked. He drew out his pencil, and produced on the spot one of the most ludicrous figures that ever was seen. What rendered this piece the more valuable was, that it exhibited an exact likeness of the man, with the portrait of his antagonist, and the figures in caricature of the principal persons collected around him.

How long he continued in obscurity has not been ascertained; but the first piece in which he distinguished himself as a painter is supposed to have been a representation of Wanstead Assembly. The figures contained in it were, it seems, drawn from the life, and without any circumstances of burlesque. The faces were said to be extremely like, and the colouring rather better than in some of his later and more highly finished performances. From the date of the earliest plate that can be ascertained as his work, it may be presumed that he began business on his own account at least as early as 1720.

His first employment seems to have been the engraving of arms and shop-bills; his next, to design and furnish plates for booksellers. Mr Bowles, at the Black Horse in Cornhill, was one of his earliest patrons, but the prices paid by that person were very low. His next friend in this line was Mr Philip Overton, who paid him somewhat better for his labour and ingenuity.

There are still existing many family pictures by Hogarth, in the style of serious conversation-pieces. What the prices of his portraits were, Mr Nichols tried in vain to discover; but he suspects that they were originally very low, as the people who are best acquainted with them choose to be silent on that subject.

Lord Orford has remarked, that if our artist indulged his spirit of ridicule in personalities, it seldom proceeded beyond sketches and drawings; and wonders that he never, without intention, delivered the very features of any identical person. But Mr Nichols assures us, from unquestionable authority, that almost all the personages who attended the levee of the Rake were undoubted portraits; and that in Southwark Fair, and the Modern Midnight Conversation, as many more were discoverable. Whilst Hogarth was painting the Rake's Progress, he had a summer residence at Isleworth; and he never failed to question the company who came to see these pictures, if they knew for whom one or another figure was designed. When they guessed wrong, he set them right.

The Duke of Leeds possessed an original scene in the Beggar's Opera, painted by Hogarth. It is that in which Lucy and Polly are on their knees before their respective fathers, to intercede for the life of the hero of the piece. All the figures are either known or supposed to be portraits. Lord Orford had a picture of a scene in the same piece, where Macheath is going to execution. In this also the likenesses of Walker, and Miss Fenton, afterwards Duchess of Bolton, the first and original Macheath and Polly, were preserved.

In 1730 Mr Hogarth married the only daughter of Sir James Thornhill, by whom, however, he had no children. This union, indeed, was a stolen one, and consequently without the approbation of Sir James, who, considering the youth of his daughter, then scarcely eighteen, and the slender finances of her husband, as yet an obscure artist, was not easily reconciled to the match. Soon after this period, however, he began his Harlot's Progress; and was advised by Lady Thornhill to have some of the scenes of it placed in the way of his father-in-law. Accordingly, one morning early, Mrs Hogarth undertook to convey several of them into her father's dining-room. When he arose, he inquired whence they had come; and being told by whom they were introduced, he cried out, "Very well; the man who can furnish representations like these can also maintain a wife without a portion." He designed this remark as an excuse for keeping his purse-strings close; but soon afterwards he became both reconciled and generous to the young people.

In 1732 Hogarth ventured to attack Mr Pope, in a plate called the Man of Taste, containing a view of the Gate of Burlington House, with Pope whitewashing it, and bespattering the Duke of Chandos's coach. This plate was intended as a satire on the translator of Homer, Mr Kent the architect, and the Earl of Burlington. It was fortunate for Hogarth that he escaped the sting of the "wasp of Twickenham." Either Hogarth's obscurity at that time was his protection, or the poet was too prudent to exasperate a painter who had already given such proof of his abilities for satire.

In 1733 his genius became conspicuously known. The third scene of his Harlot's Progress introduced him to the notice of the great. At a meeting of the treasury board, which was held a day or two after the appearance of that print, a copy of it was shown by one of the lords, as containing, amongst other excellencies, a striking likeness of Sir John Gonson. It gave universal satisfaction. From the treasury each lord repaired to the print-shop for a copy of it, and Hogarth immediately rose into fame.

The Abbé Dubos has complained that no historical painter of his time went through a series of actions, and thus, like an historian, painted the successive fortunes of a hero from the cradle to the grave. What Dubos wished to see done, Hogarth performed. He launched out his young adventurer a simple girl upon the town, and conducted her through all the vicissitudes of wretchedness to a premature death. This was painting to the understanding and to the heart; none had ever before made the pencil subservient to the purposes of morality and instruction. A book like this is fitted to every soil and to every observer; he that runs may read it. Nor was the success of Hogarth confined to his persons. One of his excellencies consisted in what may be termed the furniture of his pieces. As, in sublime and historical representations, the fewer trivial circumstances are permitted to divide the spectator's attention from the principal figures, the greater is their force, so, in scenes copied from familiar life, a proper variety of little domestic images contributes to throw an air of verisimilitude over the whole. "The Rake's levee-room," says Lord Orford, "the nobleman's dining-room, the apartments of the husband and wife in Marriage-à-la-Mode, the alderman's parlour, the bedchamber, and many others, are the history of the manners of the age."

In 1745 Hogarth sold about twenty of his capital pictures by auction; and in the same year he acquired additional reputation by the six prints of Marriage-à-la-Mode, which may be regarded as the groundwork of a novel called the Marriage Act, by Dr Shebbeare, and also of the Clandestine Marriage. The prints, however, possess far more of the true spirit of comedy than either the novel or the play; they are amongst the most masterly productions of this great dramatic painter of life and manners.

Soon after the peace of Aix-la-Chapelle he went over to France, and was taken into custody at Calais whilst he was drawing the gate of that town; a circumstance which he has recorded in his picture entitled O the Roast Beef of Old England, published in 1749.

In 1753 he appeared to the world in the character of an author, and published a quarto volume, entitled Analysis of Beauty, written with a view of fixing the fluctuating ideas of taste. In this performance he shows, by a variety of examples, that a curve is the line of beauty, and that round swelling figures are most pleasing to the eye; and the truth of his opinion has been countenanced by subsequent writers on the subject. In this work he acknowledges himself indebted for assistance to his friends, particularly to one gentleman for his corrections and amendments of at least a third part of the *wording*. This friend was Dr Benjamin Hoadly, the physician, who carried on the work to about the third part, and then, through indisposition, declined with regret the friendly office. The kind office of finishing the work, and superintending the publication, was assumed by Dr Morell, who superintended the remainder of the book. The preface was in like manner corrected by the Reverend Mr Townley. The family of Hogarth rejoiced when the last sheet of the Analysis was printed off, as the frequent disputes he had with his coadjutors, in the progress of the work, did not much harmonize his disposition. This work was translated into German by Mr Mylius, under the author's inspection; and the translation was printed in London. A new and correct edition was in 1754 proposed for publication at Berlin by Vok, with an explanation of Mr Hogarth's satirical prints, translated from the French; and an Italian translation was published at Leghorn in the year 1761.

This work may be considered as in many respects remarkable, emanating as it did from one who was totally illiterate, and who, in all probability, had never before attempted to throw together his ideas upon any subject of importance. But although his general principle is right, considered merely as expressing a *fact*, and although the feeling or sentiment which we call beauty is generally excited in the mind by objects bounded by curve lines, yet neither Hogarth himself, nor any of those persons who assisted him in the composition of his work, ever perceived that external objects are beautiful or the reverse, not because they possess this or that form, but in proportion as they are associated with, or regarded as the natural signs and emblems of, ideas or emotions which we denominate beautiful or otherwise; that the curve, considered *per se*, is not more beautiful than the angular line; that, in applying this epithet to the former, we do so, not because it is a curve, but because it suggests to the percipient mind the idea of easy, gentle, flowing motion, or some other that is calculated to excite in it the feeling which we denominate beauty; that the sentiment of beauty is a reflected image of some pleasing emotion, softened and subdued by the awakened reminiscence; that the whole, therefore, resolves into the great law of association, by means of which one thing becomes the occasion of resuscitating another in the mind; and that external objects or external forms are not of themselves beautiful or deformed, but are so called only in proportion as they are the natural signs of, and serve to recall, emotions of a pleasing character, or the contrary. But this was a discovery reserved for other and more philosophical inquirers.

Hogarth affected to despise every kind of knowledge which he did not possess. Having established his fame with little or no obligation to literature, he either conceived it to be useless, or decried it because it lay altogether out of his reach. Till he commenced author, and was obliged to employ the friends already mentioned to correct his Analysis of Beauty, he did not seem to have discovered that even spelling was a necessary qualification in a writer. Previously to the time of which we are now speaking, one of his common topics of declamation was the uselessness of books to a man of his profession. In Beer Street, amongst other volumes consigned by him to the pastry-cook, we find Turnbull on Ancient Painting; a treatise which Hogarth should have been able to understand before he ventured to condemn it.

About 1757, his brother-in-law, Mr Thornhill, resigned the place of king's serjeant-painter in his favour.

The last remarkable circumstance of his life was his contest with Churchill. It is said that both met at Westminster Hall; Hogarth to take by his eye a ridiculous likeness of the poet, and Churchill to furnish a description of the painter. But Hogarth's print of the poet was not much esteemed, and the poet's letter to him was but little admired. When genius is forced to minister to the gratification of the baser passions, its efforts are seldom successful.

It may be truly observed of Hogarth, that all his powers of delighting were limited to his pencil. Having rarely been admitted into polite circles, none of his sharp corners had been rubbed off, and he continued to the last a rough, uncultivated man. The slightest contradiction transported him into rage. To some confidence in himself he was certainly entitled, for, as a comic painter, he could have claimed no honour that would not most readily have been allowed him; but he was at once unprincipled and variable in his political conduct and private attachments. He is also said to have beheld the rising eminence and popularity of Sir Joshua Reynolds with envy, and he frequently spoke with asperity both of the painter and his performances. Justice, however, obliges us to add, that he was liberal and hospitable; and that, in spite of the emoluments which his works had procured to him, he left but an inconsiderable fortune.

Of Hogarth's lesser plates many were destroyed. When he wanted, on a sudden, a piece of copper, he would take any from which he had already worked off such a number of impressions as he supposed he would sell. He then sent it to be effaced, beaten out, or otherwise altered to his present purpose. The plates which remained in his possession were secured to his widow by his will, dated the 12th of August 1764, chargeable with an annuity of eighty pounds to his sister. He died in the month of October of that year.

The character of Hogarth as an artist is delineated by Mr Gilpin in his *Essay on Prints.* "The works of this master," says Mr Gilpin, "abound in true humour, and satire which is generally well directed; they are admirable moral lessons, and a fund of entertainment suited to every taste; a circumstance which shows them to be just copies of nature. We may consider them too as valuable repositories of the manners, customs, and dresses of his age.

"In design Hogarth was seldom at a loss. His invention was fertile, and his judgment accurate. An improper accident is rarely introduced, a proper one rarely omitted. No one could tell a story better, or make it, in all its circumstances, more intelligible. His genius, however, it must be owned, was suited only to low or familiar subjects; it never soared above common life; to subjects naturally sublime, or which from antiquity or other accidents borrowed dignity, he could not rise. In composition we see little in him to admire. In many of his prints the deficiency is so great as plainly to imply a want of all principle, which makes us ready to believe, that when we do meet with a beautiful group, it is the effect of chance. In one of his minor works, the Idle Prentice, we seldom see a crowd more beautifully managed than in the last print. If the sheriff-officers had not been placed in a line, and had been brought a little lower in the picture, so as to have formed a pyramid with the cart, the composition had been unexceptionable; and yet the first print of this work is such a striking instance of disagreeable composition, that it is amazing how an artist who had any idea of beautiful forms could suffer so unmasterly a performance to leave his hands. Of the distribution of light Hogarth had as little knowledge as of composition. In some of his pieces we see a good effect, as in the Execution just mentioned; in which, if the figures at the right and left corners had been kept down a little, the light would have been beautifully distributed on the fore-ground, and a fine secondary light spread over part of the crowd. But at the same time there is so obvious a deficiency in point of effect in most of his prints, that it is very evident he had no principles. Neither was Hogarth a master in drawing. Of the muscles and anatomy of the head and hands he had perfect knowledge, but his trunks are often badly moulded, and his limbs ill set on; yet his figures, upon the whole, are inspired with so much life and meaning, that the eye is kept in good humour in spite of its inclination to find fault. The author of the Analysis of Beauty, it might be supposed, would have given us more instances of grace than we find in the works of Hogarth; which shows strongly that theory and practice are not always united. Many opportunities his subjects naturally afford of introducing graceful attitudes, and yet we have very few examples of them. With instances of picturesque grace his works abound. Of this expression, in which the force of his genius lay, we cannot speak in terms too high. In every mode of it he was truly excellent. The passions he thoroughly understood, and all the effects which they produce in every part of the human frame. He had the happy art also of conveying his ideas with the same precision with which he conceived them. He was excellent too in expressing any humorous oddity which we often see stamped upon the human face. All his heads are cast in the very mould of nature. Hence that endless variety which is displayed throughout his works; and hence it is that the difference arises between *his* heads and the affected caricatures of those masters who have sometimes amused themselves with patching together an assemblage of features from their own ideas. Such are Spaniolet's, which, though admirably executed, appear plainly to have no archetypes in nature. Hogarth's, on the other hand, are collections of natural curiosities. The Oxford Heads, the Physicians' Arms, and some of his other pieces, are expressly of this humorous kind. They are truly comic, though ill-natured effusions of mirth; more entertaining than Spaniolet's, as they are pure nature, but less innocent, as they contain ill-directed ridicule. But the species of expression in which this master perhaps most excels, is that happy art of catching those peculiarities of art and gesture which the ridiculous part of every profession contract, and which for that reason become characteristic of the whole. His counsellors, his undertakers, his lawyers, his usurers, are all conspicuous at sight. In a word, almost every profession may see in his works that particular species of affectation which they should most endeavour to avoid. The execution of this master is well suited to his subjects and manner of treating them. He etches with great spirit, and never gives one unnecessary stroke."

In Mr Ireland's *Hogarth Illustrated*, there is an account of all his prints; but the best and fullest description of them is to be found in Mr Nichols's *Memoirs of his Life and Works*, in which there are copies of all his prints, accurately reduced.

HOGGRY, a river of Hindustan, which has its rise in the Mysore territory, near the fortress of Seva, whence it flows in a northerly direction, and joins the Krishna or Kistnah.

HOGSHEAD, in *Commerce*, a measure of capacity containing sixty-three gallons, equal to sixteen gallons in Scotland.

HOGYESK, a market-town of the circle of Toln, in the province of the Farther Danube, in the kingdom of Hungary. Near to it is the castle, with a fine park of Count Apony. It contains 3100 inhabitants, employed in the cultivation of tobacco and wine.

HOHENELBE, a town of the circle of Bidschow, in the Austrian kingdom of Bohemia. It is situated in a mountainous district, on the river Elbe, near the frontier of Saxony. It contains two churches, 357 houses, and 3307 inhabitants, who carry on a flourishing trade in manufacturing muslins, linen goods, and writing paper.

HOHENGEROLDSECK, a small territory denominated a grafschaft or county, belonging to the empire of Austria. It is the only part of the dominion detached from the rest, and is surrounded by the territory of the Prince of Baden. It extends over fifty square miles, and contains about 5000 inhabitants. It is composed chiefly of hills, which form part of the Black Forest, the highest of which, called the Schimburg, has an extensive prospect over the Rhine. There are in it some mines of lead and silver. The soil is fruitful in corn, and the valleys afford good pasturage.

HOHENSTEIN, a city of the kingdom of Saxony, in the circle of Freyburg, formerly the capital of the mediatized principality of the same name. It stands on the side of a remarkable mountain, in which are veins of gold, silver, and arsenic. It contains 450 houses, and 3400 inhabitants, some employed in the mines, but more in spinning and weaving cotton goods.

HOHENZOLLERN-HECHINGEN, a sovereign principality in the ancient division of Suabia, in Germany. It is surrounded by the kingdom of Wurtemberg, except towards the south, where it is bounded by the principality of Hohenzollern-Sigmaringen. It extends over 120 square miles, and comprehends one town and fourteen parishes, with 14,900 inhabitants. It is generally a hilly country, some of the most lofty points being 2600 feet above the sea. It is moderately fertile, but a part is covered with woods. It is watered by only small brooks, some of which run to the Danube, and others to the Neckar. The revenue amounts to about L.12,000 annually, and the debt is heavy, which the prince is lessening by contracting the expenditure. The chief products of the land are wood, potatoes, flax, hemp, and more especially gentian. The people find some employment in making wooden toys and articles of household furniture. The military contingent to the German confederation is 145 men.

HOHENZOLLERN-SIGMARINGEN, a sovereign principality in the south of Germany. Except on the north side, where it is bounded by Hohenzollern-Hechingen, it is surrounded by the kingdom of Wurtemberg and the duchy of Baden. It is 400 square miles in extent, and contains four cities, seven market-towns, and seventy villages and hamlets, formed into forty parishes. It contains 7100 houses, and 38,000 inhabitants. The land is mountainous and woody, and the soil mixed with many stones; but the valleys afford good pasture and dairy land, especially on the banks of the rivers. The Danube, here a small stream, receives the waters of all the brooks and rivulets, excepting two, which run to the Neckar. The produce of corn, aided by potatoes, is greater than the consumption; but the excess consists more of winter barley than of wheat. Some portions of the land yield excellent flax. The chief articles to be exchanged for foreign articles are wood, corn, flax, yarn, potashes, and some glass and iron goods. The latter are fabricated from some mines of that metal within the territory. Excepting a few Jews, the inhabitants are all Catholics; and in no part of Germany is education in so backward a state. The revenues of the principality amount to about L.30,000 annually, one third of which arises from the patrimonial estates of the sovereign. There are no military except a small body guard. The contingent to be furnished to the German confederation is 370 men. The capital is Sigmaringen, a fortified town, with 1340 inhabitants.

HOHNSTEIN, a small province of the kingdom of Hanover, formerly belonging to the Counts of Stolberg; but being sequestrated, it was, in 1777, transferred to Hanover, which assumed the debts upon it, amounting to about L.30,000 sterling. It lies between the Prussian province of Saxony and the duchy of Brunswick. It extends over 132 square miles, comprehends two towns, twenty-one villages, and 1220 houses, with 7360 inhabitants. A great part of the province consists of mountain and wood. Its agriculture is insignificant, but it contains mines of copper, iron, cobalt, manganese, and coal, though but slightly worked. The chief town is Ilefeld.

HOIST, in sea-language, denotes the perpendicular height of a flag or ensign, as opposed to the fly, which signifies its breadth from the staff to the outer edge.

HOISTING signifies the operation of drawing up any body by the assistance of one or more tackles. Hoisting is never applied to the act of pulling up any body by the help of a single block, except in extending the sails by drawing them upwards along the masts or stays, to which it is invariably applied.

HOKE-DAY, *Hock-Day*, or *Hock-Tuesday*, in our ancient customs, the second Tuesday after Easter week; a solemn festival celebrated for many ages in England, in memory of the great slaughter of the Danes in the time of King Ethelred, when they were almost all destroyed in one day in different parts of the kingdom, and principally by women. This is still observed in some counties; and the women bear the principal part in the observance, stopping all passengers with ropes and chains, and exacting some small matter from them to make merry withal. This day was very remarkable in former times, inasmuch as to be, like Michaelmas, a general term or time of account. We find leases without date reserving so much rent payable *ad duos anni terminos, silicet, ad le* hoke-day, *et ad festum sancti Michaelis*. In the account of Magdalen College, Oxford, there is yearly an allowance *pro mulieribus hoc-*

hantibus of some manors in Hampshire, where the men hock the women on Mondays, and the women hock the men on Tuesdays. The meaning of this is, that on that day the women in merriment stopped the way with ropes, and pulled passengers to them, desiring something to be laid out for pious uses.

Hoke-*Day Money*, or *Hoke-Tuesday Money*, a tribute anciently paid to the landlord for giving his tenants and bondsmen leave to celebrate hock-day, or hoke-day, in memory of the explusion of the Danes.

HOLBEACH, a town of the county of Lincoln, in the hundred of Elloe, in the parish of Holland, 106 miles from London. It is situated in a marshy district, surrounded with excellent fen pasture. It is a place of great antiquity, but not well built. There is a market, which is held on Thursday. The inhabitants amounted in 1801 to 2683, in 1811 to 2962, in 1821 to 3621, and in 1831 to 3890.

HOLBEIN, Hans, a celebrated painter, born at Basil in Switzerland in 1498. He learned the rudiments of his art under his father, who was a painter; but soon showed superior genius. In the town-house of Basil he painted Christ's Passion, and in the fish-market of the same city Death's Dance, and a Dance of Peasants, which were extremely admired, and with which Erasmus was so pleased that he desired the artist to draw his picture, and was ever afterwards his friend. He staid some years longer at Basil, till his necessities, occasioned by his own extravagance and an increasing family, induced him to comply with the persuasions of Erasmus, and repair to England. In his journey he staid some days at Strasburg, where it is said he applied for work to a great painter, who took him in, and ordered him to give a specimen of his skill. Holbein then finished a piece with great care, and painted a fly on the most eminent part of it; after which he privately withdrew in the absence of his master, and pursued his journey, without saying any thing to any body. When the painter returned home, he was astonished at the beauty and elegance of the drawing; and especially at the fly, which he at first took for a real one, and endeavoured to remove with his hand. He now sent all over the city in quest of his journeyman; and after many inquiries, discovered that he had been thus deceived by Holbein. The painter having in a manner begged his way to England, presented a letter of recommendation from Erasmus to Sir Thomas More, and also showed him Erasmus's picture. Sir Thomas, then lord chancellor, received him with all imaginable kindness, and kept him in his house between two and three years, during which time he painted Sir Thomas's own picture, and those of many of his relations and friends. Holbein one day happening to mention a nobleman who had some years before invited him to England, Sir Thomas was very solicitous to know who it was. Holbein said that he had forgotten his title, but remembered his face so well that he believed he could draw his likeness, and this he did so perfectly, that the nobleman is said to have been immediately recognised by it. The chancellor having now adorned his apartments with the productions of this great painter, resolved to introduce him to Henry VIII. For this purpose he invited the king to an entertainment; and, before he arrived, placed all Holbein's pieces in the great hall, where they were disposed in the best order, and in the best light. The king, on his first entrance into this room, was so charmed with the sight, that he asked whether the artist was still alive, and to be had for money? Upon this, Sir Thomas presented Holbein to his majesty, who immediately took him into his service, and brought him into notice among the nobility and gentry, for whom he painted a great number of portraits. But whilst he was thus occupied, there happened an incident which might have proved fatal to him, had he not been protected by the king. On the report of this painter's character, a lord of the first quality came to see him when he was drawing a figure after the life. Holbein sent to desire his lordship to defer the honour of his visit till another day; but the nobleman taking this as an affront, broke open the door, and pushed rudely up stairs. Holbein hearing a noise, came out of his chamber, met the lord at his door, and falling into a violent passion, pushed him backwards from the top of the stairs to the bottom. But immediately reflecting on what he had done, he escaped from the tumult he had raised, and made the best of his way to the king's presence. The nobleman, much hurt, though probably not so severely as he pretended, was there soon after him; and upon stating his grievance, the king ordered Holbein to ask his pardon. But this only increased the irritation of the nobleman, who declared that he would not be satisfied with less than the painter's life. Upon this the king sternly replied, "My lord, you have not now to do with Holbein, but with me: whatever punishment you may contrive by way of revenge against him, shall certainly be inflicted on yourself. Remember, pray, my lord, that I can whenever I please make seven lords of seven ploughmen, but I cannot make one Holbein of even seven lords." Holbein died of the plague at his lodgings at Whitehall in 1554. "It is amazing," says De Piles, "that a man born in Switzerland, and who had never been in Italy, should have so good a *gusto*, and so fine a genius for painting." We, however, see nothing at all amazing in this. Nature has not, as far as we know, given to Italy an exclusive monopoly of the genius for art, though the treasures contained in the galleries and cabinets of that glorious country are, no doubt, eminently calculated to facilitate its cultivation and advancement; nor is there any reason why a great artist, with a soul alive to the finest perceptions of grace and beauty, should not be born in Switzerland, or in Sweden, as well as in Italy or in Greece. The production of genius is not circumscribed by geographical boundaries; and though several countries may afford better opportunities than others for forming the taste and purifying the perceptions of an artist, none is altogether destitute of the native element, and in some it may be generated in such inherent vigour as, in a great measure, to dispense with the ordinary advantages of instruction. Holbein painted alike in every manner; in fresco, in water-colours, in oil, and in miniature. His genius was sufficiently shown in the historical style, by two celebrated compositions which he painted in the hall of the Steelyard Company. He was also eminent for a rich vein of invention, which he showed in a multitude of designs drawn for engravers, statuaries, jewellers, and other artisans; and he had this singularity, that he painted with his left hand.

HOLD, the interior cavity of a ship, or all that part of her inside which is comprehended between the floor and the lower deck throughout her whole length. This capacious apartment usually contains the ballast, provisions, and stores of a ship of war, and the principal part of the cargo in a merchantman.

HOLDER, William, an English divine, was born in Nottinghamshire, educated in Pembroke Hall, Cambridge, and appointed rector of Blechingdon of Oxford in 1642. In 1660 he received the degree of doctor in divinity, and afterwards became canon of Ely, fellow of the Royal Society, canon of St Paul's, sub-dean of the chapel royal, and sub-almoner to his majesty. Dr Holder was an accomplished scholar, and distinguished himself by teaching a young gentleman of rank who was born deaf and dumb, to speak. This gentleman's name was Alexander Popham, son of Colonel Edward Popham, who was for some time an admiral in the service of the Long Parliament. The cure was performed by him at Blechingdon in 1659; but Popham losing what he had been taught by Holder after he returned home to his friends, was sent to Dr Wallis, under

Holdsworth
||
Holiness.

whom he recovered the use of speech. Holder published a book entitled the Elements of Speech, being an inquiry into the natural production of letters, with an appendix concerning persons who are deaf and dumb, 1669, 8vo. In the appendix he relates how soon, and by what methods, he brought Popham to speak. In 1678, he published a Supplement to the Philosophical Transactions of July 1670, with some reflections on Dr Wallis's letter there inserted, in 4to. This was written to vindicate the merit of having taught Popham to speak, which Wallis in the letter referred to had claimed to himself; but Dr Wallis soon afterwards published a Defence of the Royal Society, and the Philosophical Transactions, particularly those of July 1670, in answer to the Cavils of Dr William Holder, 1678, in 4to. Holder was skilled in the theory and practice of music, and wrote a treatise on the Natural Grounds and Principles of Harmony, 1694, 8vo. He also wrote a Discourse concerning Time, with application of the natural day, lunar month, and solar year, &c. 1694, in 8vo. He died at Amen Corner in London, on the 24th of January 1696, and was buried in St Paul's.

HOLDSWORTH, Edward, a polite and elegant scholar, was born about the year 1688, and educated at Winchester school. He was thence elected demy of Magdalen College, Oxford, in July 1705; took the degree of master of arts in April 1711; and then became a college-tutor, and had many pupils. In 1715, when about to be chosen to a fellowship, he resigned his demyship and left the college, because he felt unwilling to take the oath of allegiance to the new government. The remainder of his life was spent in travelling as tutor with young noblemen and gentlemen, in which capacity he visited Rome in 1741 and 1744. He died of a fever at Lord Digby's house at Coleshill in Warwickshire, on the 30th of December 1747. He was the author of the *Muscipula*, a poem, esteemed a masterpiece of its kind, and of which there is a good English translation by Dr John Hoadly, in Dodsley's Miscellanies (vol. v.). He was also the author of a dissertation entitled Pharsalia and Philippi, or the two Philippi in Virgil's Georgics attempted to be explained and reconciled to History, 1741, in 4to; and of Remarks and Dissertations on Virgil; besides some other classical observations, published with several notes and additional remarks by Mr Spence, 1768, in 4to. Mr Spence speaks of him in his *Polymetis*, as one who more thoroughly understood Virgil than any person he ever knew.

HOLDSWORTHY, a town of the county of Devon, in the hundred of Black-Torrington, 214 miles from London. It is in a pleasant situation between two branches of the river Tamar, which unite and run to Plymouth. There is a small market, which is held on Saturday. The inhabitants amounted in 1801 to 1045, in 1811 to 1206, in 1821 to 1440, and in 1831 to 1628.

HOLESCHAU, a city of the circle of Hradesch, in the Austrian province of Moravia, on the river Nussawa. It contains 305 houses and 3733 inhabitants, of whom one third are Jews. It has considerable manufactures of woollens, and much internal trade.

HOLINESS, or Sanctity, a quality which constitutes or denominates a person or thing *holy*, that is, pure, or exempt from sin. The word is also used in respect of persons and things that are sacred, or, in other words, set apart to the service of God, and the uses of religion.

Holiness is also a title of quality attributed to the pope, as that of *majesty* is to kings. Even kings, when writing to the pope, address him under the venerable appellation of Your Holiness, or Holy Father; in Latin, *Sanctissime* or *Beatissime Pater*. Anciently the same title was given to all bishops. The Greek emperors also were addressed under the title of Holiness, on account of their being anointed with holy oil at their coronation. Du Cange adds, that some of the kings of England have had the same attribute; and that the orientals have frequently refused it to the pope.

HOLINSHED, Raphael, one of that humble but useful class of historians called chroniclers, was descended of a family which lived at Bosely in Cheshire; but neither the time nor place of his birth is known, nor indeed any other circumstance of his life. According to Bishop Tanner, he was educated at Cambridge, and became master of arts in the year 1544. But the nature and extent of his education, as well as his profession, are involved in uncertainty. It seems probable, however, that he was steward to Thomas Burdett, of Bomcote in Warwickshire, where he died about the year 1580. He has given his name to a compilation of Chronicles of English History from the earliest times, the first edition of which was published at London in 1577, in two volumes folio; and the second edition, in three volumes, was printed about seven years after his death, being brought down to 1586. This work, according to the testimony of Holinshed himself, was begun by the advice of Reginald Wolfe, printer to Queen Elizabeth. Part of it was compiled by himself, but he received considerable assistance from William Harrison, John Hooker, Abraham Fleming, Francis Thynne, and some others. After the death of Holinshed, it was continued by John Stowe. Some parts of the first edition were altered in the second and third, because they gave offence to Queen Elizabeth and the ministry, who laid many restrictions on the liberty of the press; but the castrated sheets were reprinted apart in 1723. The first volume of the Chronicles opens with an Historical Description of the Island of Britain by William Harrison; and this is followed by the History of England, from the time when it was first inhabited until that when it was last conquered, by Holinshed himself. The second volume contains the Description, Conquest, Inhabitation, and troublesome Estate of Ireland, by Richard Stanihurst; the conquest of Ireland, translated from the Latin of Giraldus Cambrensis by John Hooker, or Vowell; the Chronicles of Ireland, beginning where Giraldus ended, by Holinshed; the Description of Scotland, translated from the Latin of Hector Boethius, by Holinshed and Harrison; and the History of Scotland, containing the beginning, increase, proceedings, continuance, acts and government of the Scottish nation, from the original thereof unto the year 1571, compiled by Holinshed, and continued from 1571 to 1586 by Francis Boteville and others. The third volume commences with Duke William the Norman, commonly called the Conqueror, "and descends by degrees of yeeres to all the kings and queenes of England." As already mentioned, the time of Holinshed's death, like the date of his birth, is unknown; but from his will, which Hearne has prefixed to his edition of Camden's *Annals*, it would appear that it must have happened between 1578 and 1582.

HOLLAND, Dr Philemon, a noted translator, was descended of an ancient family in Lancashire, and educated in the university of Cambridge. He was for many years a schoolmaster at Coventry, where he also practised physic. He translated into English, Livy, Pliny's *Natural History*, Plutarch's *Morals*, Suetonius, Ammianus Marcellinus, Xenophon's *Cyropædia*, and Camden's *Britannia*; and into Latin the geographical part of Speed's *Theatre of Great Britain*, and the French Pharmacopœia of Brice Bauderon. But the *Britannia*, to which he made many useful additions, was the most valuable of his works. It is surprising that a man of two professions could find time to translate so much; but it appears, from the date of the *Cyropædia*, that he continued to translate till he was eighty years of age. He died on the 9th of February 1636, at the advanced age of eighty-five.

HOLLAND.

HOLLAND is an European kingdom, formed in part of islands, but chiefly of that part of the Continent where the mouths of the Rhine are divided into several branches before it enters the German Ocean. This district is said to have owed the ancient name of Batavia, by which it was known to the Romans, to one Bato; but at what period he flourished is unknown; and the name is now scarcely used excepting amongst the poets of the district. By accounts collected from the works of Cæsar and Tacitus, we learn that the ancient tribes who inhabited this portion of Europe had been able to maintain their independence in spite of the attempts made to subdue them by the Teutones, the Cimbri, and other nations, who had conquered the rest of what was then called Gaul. The Batavians, says the last of these historians, excelled all the other people on the Rhine in military spirit. When subdued by the Romans they paid their tribute in soldiers; and from them was formed a cavalry, which composed the most efficient part of the Roman armies. They astonished the Dacians by the dexterity and bravery with which, completely armed, they swam their horses across the Danube to attack those people; and for a long period they formed the guard of the Roman emperors. A body of Batavians accompanied Agricola on his expedition into Britain, and were of great assistance in securing his conquests in the island.

Although the Romans at length overcame the Batavians, it was after a strenuous resistance. The last that submitted was the tribe of the Frisons, who inhabited the marshes. Drusus, the Roman commander, constructed a canal between the Rhine and the Zuyder Zee. and thus opened a way into the German Ocean to the Ems and the Weser, by which he was enabled to penetrate into the heart of Germany, and to subdue that country. During four centuries the Batavians formed part of the Roman legions; but amongst these, after the reign of the Emperor Honorius, their name is no longer to be found.

After that period the islands were overrun by the Franks; and the transactions relating to them have been mixed up with those of the adjoining Belgians. The Frieslanders, however, opposed and broke through the armies of the Franks, and made their appearance as a free, and in some measure a victorious people, on the left bank of the Rhine; and there, adhering to their ancient customs, upon which had been engrafted many of the principles introduced by the Romans, they long maintained their independence. These people had suffered the least from the invasion of foreigners, and retained through several centuries distinct traces of their ancient constitution, their national spirit, and their national manners.

In the fifth and sixth centuries the kingdom of the Franks, which had arisen out of the ruins of the Roman power, gradually extended itself, and in the seventh had subdued the last of the Batavian people, the long resisting Frisons. Under Charles Martel the last conquest was achieved, and a way opened by his sword for the introduction of the Christian religion.

When Charlemagne had obtained his extensive dominion, and the feudal system was introduced, and continued under his successors, the powerful vassals of the crown, to whom the lands were granted, by degrees acquired a sort of mitigated sovereignty; but being unable to maintain themselves without the assistance of their under feudatories, they were compelled, in order to secure their fidelity, to grant them advantageous conditions of tenure. The clergy, too, by pious usurpations or pious donations, became a powerful and independent corporate body. Thus, during the tenth, eleventh, twelfth, and thirteenth centuries, the whole of Belgium and of Batavia was split into several small dominions, the princes of which acknowledged a limited allegiance, some of them to the German empire, and others to the kings of the Franks. During this period Brabant, and afterwards Luxembourg, Limburg, and Gueldres, obtained the name of dukedoms; Flanders, Holland, Zealand, Hennegau, Artois, Namur, and Zutphen, were ranked as Graffschalftr, or countships. Utrecht was a bishopric, the prelate of which exercised civil authority also in Overyssel and Groningen. Amongst all these chiefs the Count of Flanders was the most powerful; and as, in 1383, that countship fell to the then more powerful house of Burgundy, the prince of that family, partly by intermarriages, partly by force, and partly by voluntary or purchased submission, obtained supreme authority over the whole of what became the seventeen provinces of the Netherlands.

This appears to have been the most flourishing period of these provinces. Agriculture was carried on with spirit, skill, and abundant results. Manufactures of linen, and especially of woollen goods, gave occupation to an increasing population; and foreign commerce was extensive and profitable. The commodities of India brought to the Italian cities were transmitted to Antwerp, Bruges, and some other places, where extensive depôts were established for foreign and domestic goods, and where, at the periodical fairs, the merchants of the northern kingdoms of Europe resorted, and transacted their commercial affairs.

The government of the Dukes of Burgundy was tempered by the privileges enjoyed by the cities, and by the nobility who possessed the land; and, though contests frequently arose between the sovereign and the states, they rarely came to open hostilities. When disturbances occurred, they were not of such duration, or so extensive, as to interrupt in any great degree the rapid growth of general wealth and progressive improvement.

Charles the Bold, the last of the Dukes of Burgundy, lost his life in a battle with the cantons of Switzerland in 1477. His eldest daughter Maria married Maximilian, duke of Austria, and received the Netherlands as her portion; and her grandson, born at Ghent, afterwards Charles V., emperor of Germany, thus became sovereign of those countries and of the kingdom of Spain from the moment of his birth. Before the marriage of Maria, and also under Maximilian, when he had become emperor and guardian of his son, attempts were made to lessen the influence of the states. But these were powerfully resisted by some of the cities, and especially by Bruges, in 1487, and by Sluys about the same time. Bruges was sufficiently strong to resist the encroachments; but Maximilian, in despite of its privileges, blocked up the port of Sluys for ten years, which caused the foreign ships that before crowded to that place to repair to Antwerp and Amsterdam; and these cities from that period became the two principal seats of foreign commerce.

The Netherlands, at the end of the fifteenth century, became the great school for the fine arts. These had been introduced from Italy; and the artists of the Low Countries were soon successful rivals of their masters of Florence, Bologna, and Venice, in painting, in statuary, in architecture, and in engraving. The art of printing, if not invented, was first made known at Haerlem, and was soon practised in other cities of the Netherland provinces.

At the accession of Charles V. the situation of the Netherlands became widely changed. Instead of a paternal government, the chief of which in a great measure depended on the prosperity of these provinces, they were converted into a dependent, and, though rich and populous, an insignificant part of a large empire, to the promotion of whose greatness, whether for good or for evil to themselves, they must in future be almost wholly subservient.

Between the Flemings and the Spaniards an excessive distaste was mutually felt, which soon attained to the most inveterate hatred. This originated in the difference of genius, of manners, customs, and mode of government, and was quickly increased by the regret natural to a powerful people, such as those of the Netherlands deemed themselves, at being incorporated, and thereby almost swallowed up, by another nation. Steps were early taken by Charles, under the pretence of introducing unity in his territories, that had a tendency to undermine the privileges which the Netherland states had zealously defended and long maintained. Before his accession a legal tribunal had been established at Mechlin, to which appeals might be made from all the legal tribunals of the confederate states; and as none but natives were judges, and their decisions were guided by the ancient laws, it was looked up to with confidence, and considered as a security to their constitutions. This tribunal was, however, nullified by being placed under an imperial court, established at Brussels, several of the members of which were foreigners, and all of whom were dependent on the royal favour alone. This imperial court was naturally viewed with a jealous eye, and was ill adapted for the protection of those rights to which the people were attached.

The growing expenses of the hostile operations of Charles in other parts of his extended dominions, made his demands on his Netherland subjects much heavier. In spite of their ancient right of levying taxes, he imposed some that were new, and increased others. The history of this reign contains constant repetitions of subsidies required, which were at first rejected or deferred, but at length yielded, though with reluctance and discontent.

Another subject of murmuring was the introduction of foreign troops, that is, forces belonging to the other dominions of the emperor, as well as recruiting his armies in the Netherlands without the consent of the states; circumstances which, besides being contrary to the constitution, involved them in wars to which they were indifferent or repugnant, and which were injurious to their interest as a commercial people.

Charles felt that the commerce of his subjects could alone enable him to extract from them those pecuniary supplies which his general government needed; and so far he protected their manufactures and mercantile affairs, and in some cases even recalled edicts, at the requisition of his Flemish subjects, which he would have without hesitation enforced at Madrid. The most influential of all the causes which arose in the reign of Charles V. was the religious reformation which had commenced in Germany, had spread in France, and from both these countries had been introduced into the Netherlands, chiefly in the trading cities, and in them had gained numerous adherents. The full effect of this, and of the other causes which have been here noticed, did not appear until the abdication of the emperor had elevated his son Philip II. to the extensive dominions of his father.

The religious excitement gave some uneasiness to Charles, and measures were feebly applied to check the progress of the new opinions, to which, when not actuated by political views, he at one time seemed not to be strenuously inimical. Had the emperor been disposed to severity towards the professors of the Protestant tenets, any measure of that nature would have affected the interests of commerce, and have tended to diminish the revenues he drew from that source. The foreign merchants who had establishments, or frequented the fairs, in the Netherlands, brought with them from Germany, England, France, and other countries, the doctrines and the writings of the Protestants. These were diffused amongst the natives, and made a great impression; and any attempts to destroy their intercourse, or to punish them for their opinions, would have driven commerce, as it did a few years later under Philip II., to the other markets of Europe, where greater religious freedom was enjoyed.

Towards the close of his reign, Charles issued indeed some most severe laws against those who professed the new religion. These were in some cases applied with unfeeling cruelty, though they tended but little to diminish the progress of the dissident principles. He had resolved, after the successful issue of his wars in Germany, to reduce his Netherland subjects to uniform obedience to the Roman Catholic religion, and for that purpose he designed to have introduced the Inquisition. The fear alone of that dreaded tribunal in Antwerp suspended immediately all commerce, and the most eminent foreigners made instant preparations to remove. There were neither buyers nor sellers to be seen, the value of the buildings was destroyed, and all the operative labourers were discharged. Money totally disappeared, and no taxes could be collected. At the earnest recommendation of the Duchess of Parma, as vice-regent, this edict was suspended. The common tribunals were directed to practise no molestation on the foreign merchants; and, instead of the Inquisition, a milder court, at least in name, was framed, and called the ecclesiastical tribunal. In the other provinces, however, much severity was beginning to be practised, not long before the abdication of Charles; but, severe as these were, the remembrance of them was speedily obliterated by the more savage cruelties practised under the reign of his son.

The reign of Charles was, upon the whole, beneficial to the United Netherland Provinces, and he left that division of his dominions in a most flourishing condition; so that for its extent it was by far the most considerable state in Europe. Their taxes were by no means heavy, though their trade was most extensive; and the mechanical genius and persevering industry of the inhabitants had rendered the Low Countries the workshop of Europe. When the emperor, at his solemn abdication, delivered over these provinces to the rule of his son, they are reported to have contained three hundred and fifty cities, and six thousand three hundred towns and large villages, besides numerous hamlets, farm-houses, and castles. These comprehended the four dukedoms of Brabant, Limburg, Luxembourg, and Guelderland; the seven countships of Artois, Hennegau, Flanders, Namur, Zutphen, Holland, and Zealand; the margravate of Antwerp; and the baronies of Friesland, Mechlin, Utrecht, Overyssel, and Groningen. Statistical researches were not much practised at that period, and no accurate views can be obtained of the extent of the population; but there is good reason to conclude, that, though at present the Netherlands are the most densely peopled of any part of Europe, the numbers then were more than equal to what they are now. The seven provinces which afterwards formed the republic were probably less populous; but the other divisions, where manufactures were more generally carried on, were, from all accounts, proportionally more crowded. Philip II. ascended the throne on the abdication of his father in October 1555. He had been educated in Spain, and had imbibed the retired and stately manners of that country. He spoke no other language but Spanish, and, except the short time he had passed in England after his marriage with Queen Mary, he had scarcely ever left the peninsula. He was most zealously attached to the Roman Catholic religion, and not less so to the unrestricted exercise of arbitrary power. He was distrustful of those who administered public affairs, was nearly invisible to his subjects, and the few who had access to his presence were commonly disgusted both with his manners and with the punctilious formalities with which their introduction was attended. He was deemed insensible to human sufferings, and was equivocating, if not insincere, in the replies he made to the petitions of his subjects.

He remained in the Netherlands from his accession in 1555 till August 1559, when he embarked for Spain, and never afterwards returned. The measures he introduced during his stay, his repulsive manners, and the humours he displayed at his departure, all tended to strengthen that aversion, mingled with suspicion, which had begun to manifest itself during the reign of his imperial predecessor.

The most obnoxious measures to the people were, first, a design to abolish several of the monastic establishments, in order that their estates might be converted into revenues for new bishoprics, the incumbents of which were to be the instruments of introducing the Inquisition into the provinces. That institution was held in such abhorrence, that it encountered every obstruction which could be opposed to it, both by the Catholics and the Protestants. It had met also, at the court of Rome, some obstacles which caused delay, so that the arrangement was not completed when the king departed for Spain. The second cause of complaint was the retention of foreign forces within the states. When the king came to the throne, a war was carried on with France; but the French having been signally defeated at the battle of St Quentin in 1557, a peace was, after long negotiations, completed at Chateau-Cambresis. The withdrawing of the troops, consisting both of the Spanish infantry and of some German auxiliaries, was eagerly looked for by all the inhabitants. The latter were disbanded and sent home, but the former were retained, and proved dreadfully oppressive to the country. Vander Vynckt, the faithful historian of Flanders, says, "the Spaniards were so elevated with their late successes against the French, that they thought the ransom or the pillage of the whole of the Netherlands would be an insufficient recompense for the actions they had performed. They lived at free quarters on the country, and trampled upon the people without pity." In fact, receiving little or no pay, or that pay being much in arrears, they were of necessity instigated to all kinds of disorders, and led to practise the most abominable oppressions. The remonstrances of the states were coldly received, and though assurances were given that the grievance should be removed, and the period for it was fixed, it was delayed from time to time, and ultimately consented to in appearance only, as they remained on the frontiers, ready to re-enter when the ulterior measures which were in preparation should require their assistance. As one means of delaying the departure of these troops, two legions were proposed to be placed under the command of the Prince of Orange and Count Egmont, two of the most patriotic and popular of the nobility. But their integrity resisted the temptation; they declined the command, and this rendered the continuance of the troops the more obnoxious.

A third cause of complaint was, a violation of the ancient constitution of the states, by introducing into the higher executive and judicial offices persons of foreign birth. When Philip left the Netherlands, the government was conferred on the Duchess of Parma, a natural daughter of the Emperor Charles V. She was to be assisted by a council of state, composed of the Prince of Orange, the Counts Egmont and Horn, Granvelt bishop of Arras, Count Barlaimont, and Vigilius de Quichem. But by secret orders, but which soon transpired, a committee of this council, consisting of the three last named, was empowered in most cases to communicate alone with the duchess, and in all cases to decide on the advice which was to be given to her. Thus the Prince of Orange and the two counts were mere ciphers, and rarely attended the council. Barlaimont was a mere creature of Granvelt, who attended only to the finances, of which he was chief, and was commonly absent when other affairs were under consideration; Vigilius was a man of profound scholastic learning, very politic, and very yielding; so that, in fact, the whole power was conceded to Granvelt. He was a native of France, and had distinguished himself by his learning, but more by his subservience to the rigour and the caprices of Philip. By these means, from the low condition of a parish priest, he was raised to the episcopal rank, and finally to the dignity of a cardinal. His being a foreigner was the pretext, but his arbitrary disposition and intolerant rigour the causes, of general aversion; and the firmest and most pointed representations of the assemblies of the several states were solely but unavailingly directed towards him. He alone conducted all affairs, and to him the secret orders of the king were conveyed.

The three members of the council who had been named on account of the estimation in which they were held among the natives of the Netherlands, though they were utterly inefficient as members of the board, should not be passed over without short notices of their rank and character, on account of the vast interest which has been excited by the events they directed, and the fates they experienced.

William of Nassau, prince of Orange, was one of the greatest men of his own or any other age. He had in his youth been brought up in Germany, his native country, amongst Protestants, whose creed his father had adopted. Being of an illustrious house, he was early introduced to the Emperor Charles, whose favour and confidence he obtained, and he was employed by him in some most honourable commissions and embassies. He came to the possession of the family inheritance on the death of an uncle and a cousin, consisting of extensive estates in Burgundy and the Netherlands, and thus was by far the richest of all the nobles of the country. By his wealth he was enabled to live magnificently when ambassador in France and in England, and afterwards at home when governor of the provinces of Holland and Zealand. He was as highly estimated in foreign countries as in the Netherlands, and had formed numerous alliances and friendships in England and France, and others still more considerable in Germany. He was a man of penetration, courage, and resolution, with enlarged and accurate political views. His measures were maturely considered, but when once determined upon, nothing could shake them. In the greatest adversity he was firm and tranquil, and he possessed in his mind inexhaustible resources. He was remarkable for his taciturnity, from which circumstance he was sometimes distinguished by the name of William the Silent. An Italian proverb has appropriately described him, *Tacendo parla, parlando incanta.*

Lamoral count Egmont was also a nobleman of the first rank, of a family originating in Holland, some members of which had in former times been the sovereign Dukes of Guelderland. His mother, the heiress of the house of Luxembourg-Fiennes, had brought to the family of Egmont estates in Flanders of vast extent and riches. He was adored by the inhabitants of Flanders and Artois, of which provinces he was the governor, and was generally considered as the fittest person to have filled the dignity held by the Duchess of Parma. He was generous, frank, disinterested, and open hearted. He was besides a good general, possessing intrepid courage, and had distinguished himself in the war with France. He was less adroit than the Prince of Orange, and had less of foresight, but he was as eminent in the field as the other was in the cabinet. These men were at one time rivals for power, but a common interest closely united them. Philip de Montmorenci, count Horn, was an admiral, and in his command of the naval forces had displayed the most intrepid courage, and had rendered great service to the Spanish government. He had been governor of the provinces of Zutphen and Gueldres, and by the management of Granvelt had been suspended and sent into Spain, where he is said to have acquired a thorough knowledge of the operations intended against the liberties of his country, and communicated them to the Prince of Orange. He was reported also to have then had some intercourse with Don Carlos, the heir to the throne of Spain, who himself was supposed to feel differently on the affairs of the Netherlands from his father King Philip.

With these three leaders were connected others of rank nearly equal, the whole of the inferior nobility, and a very large majority of the burghers, merchants, and manufacturers of the cities and towns; and in particular almost the whole of those people who were connected with maritime transactions, either as owners or navigators of vessels.

We return now to the causes of complaint which were made in the Netherlands. The fourth of them was, the omitting to call together the general assembly of the states. Though under the reign of the Emperor Charles the power of that body had been much curtailed, they were yet the organ of the opinions and feelings of the more respectable part of the nation. Their views and complaints were freely communicated to the government, and exercised influence on its decisions. One of the last and most decisive instructions given by Philip to the Duchess of Parma, before his departure for Spain, forbade the assembling of this body.

The chief points upon which the subjects felt aggrieved are only here noticed, though there were many others, some of a minor and some of a local nature, all which, combined with the general disgust felt towards Spain and the Spanish monarch, tended to shake the authority of the king, by indisposing the civil tribunals from following up with zeal the ordonnances which from time to time were issued by the sovereign.

These complaints had at a very early period excited secret associations amongst the nobility and gentry which were in opposition to the extension of the severe penal laws. One of these associations was formed as early as 1556, by Martiner baron of St Aldegonde in Breda, a confidential friend of the Prince of Orange. He, with ten or twelve others of equal rank, drew up a declaration, then known by the name of the *Compromise.* It contained execrations against the Inquisition, which it painted in the most horrible colours. It accused foreigners of having seduced the king to refuse the abolition of his rigid ordonnances, that they might be enabled to gratify their ambition and their avarice; and it concluded with declaring, that they were united to assist the oppressed, to resist violence, and, above all things, never to submit to the establishment of the Inquisition. When this compromise had been signed at Breda, numerous copies of it were made and circulated throughout all the provinces, from Artois to Friesland. It was signed with avidity by all classes, from the highest nobility to the lowest artisans. This association at length became so extensive and bold as to determine on an application to the regent, for which purpose the leaders requested an audience, that they might lay their complaints before her. This request, after much hesitation and with some symptoms of alarm on the part of the government, was at length granted. The nobles assembled at Brussels, attended, according to the custom of the age, by their numerous followers, and, marching to the palace in a long train in regular order, were admitted to an audience. The address was read by Brederode count of Utrecht. It contained strong professions of obedience and loyalty, and asserted that the associates were innocent of the charge of which they had been calumniated, of having entered into engagements with foreign powers. In conclusion, a convocation of the states-general was requested, and in the mean time a provisional suspension of all inquisitorial measures and proclamations, until a reply could be received from the king, who was then in Spain. An equivocal reply was given, the substance of which was merely that more temperate measures would be pursued till the orders of the king were received.

This assembling of the nobles gave to the associates a name which was assumed and long continued as a mark of distinction. During the audience at the palace, the duchess appeared somewhat alarmed at the great number of persons which composed the deputation. Count Barlaimont, one of her suite, in order to calm her disquietude, whispered, but sufficiently loud to be heard by those who were nearest, that they were nothing more than *un ramas de gueux*, a crowd of beggars. On this being reported at a convivial meeting of the nobles, one of them, as a toast, gave *vivent les gueux*, which was received with acclamation, and the name afterwards adopted; and their clothing and ornaments were so worn as to exhibit emblems like those in use amongst conventual mendicants and other beggars, one of the most distinguishing of which was a sack thrown over the shoulders, on which was frequently painted the motto of the association, *Fidèle au roi jusqu'à la besace.*

The exhibition of strength on the part of the associates led to a series of negotiations between the vice-regent and the party, which at length was terminated on the 23d of August 1566, by the duchess provisionally, till orders could be received from Spain, agreeing to suspend the introduction of the Inquisition, and in the mean time to submit her other measures to the revision of the states-general.

Even this kind of truce was only conceded in consequence of some tumultuous and outrageous assemblages, partly excited by the Protestant preachers, but of which they soon ceased to have any power of direction or control. The assemblies first collected by field preachers were composed of those who had imbibed the Protestant opinions, and were held on the frontiers of Liège, about St Trond. They were soon joined, out of curiosity, by numbers anxious to hear the new doctrines, but speedily afterwards by all the wandering tribes of outlaws, vagabonds, and plunderers; and at length they became so numerous that no resistance could be made to them in the open country, or even in the cities which were not fortified and well garrisoned. The Catholic writers of the period represent these assemblages as being composed principally of the sectarians of Germany and the Calvinists of France, joined to the Anabaptists of Leyden and other parts of Holland. It seems evident, however, that these were very early outnumbered by others whose chief objects were plunder and destruction. Their first operations were to attack and rob the monasteries in the open country; they then seized on the churches, and destroyed all the images and other appendages of the Catholic worship, carrying away with them whatever was portable and valuable. The peaceable inhabitants appeared everywhere panic-struck, and the desolating power thus let loose was opposed by no obstacles; so that at length all the cities except Brussels were more or less subject to the depredators. Ypres, Tournay, Valenciennes, and Oudenarde suffered the most. At Antwerp the Prince of Orange suspended the destruction as long as he remained there, but after his removal the insurgents gained the superiority, and were enabled to destroy the images and ornaments of the cathedral, as well as those of the other churches and monasteries, in that city. This devastation was like a hurricane, and though the storm passed over in a short space of time, its effects were frightful, and its destructive operations extensive.

The duchess, though about to leave Brussels, and seek safety in Mons, was persuaded by her council to remain in the capital, where intimidations on one side, and proposals to treat with the insurgents on the other, were urged with vehemence. To the latter she at length yielded, and authorized the Prince of Orange, with the Counts Egmont and Horn, to treat with the chiefs of the insurgents, who still continued in St Trond. This measure was so far successful for the time, that, after the provisional agreement already noticed, a treaty was concluded with the leaders at St Trond, and signed on the 25th of August. It was agreed that the preachers might continue their religious practices in the places where they actually did exercise them, that the people might attend them, but unarmed, and cause no trouble to the Catholics. The nobles were to renounce the confederation, and all were to lay down their arms, and assist in restoring and re-establishing the estates, the churches, the monasteries, and the hospitals that had been plundered, and indemnify those who had suffered.

A temporary lull was thus procured, though frequently interrupted by local explosions. All were waiting with impatience for intelligence from Madrid, whither couriers were immediately forwarded after the pacification, with despatches from the duchess to King Philip. The letters to Spain were expressed in the most melancholy strain. The duchess confessed that she had granted to the insurgents terms that were degrading to herself, and which she could not relate without shame and grief. She affirmed that she had long resisted, but, weakened by fever and sleepless nights, had at length yielded; that with anguish of mind and bodily pain, and the fear of greater evils, she had granted pardon to the rebels, and had acceded to their demands, but that she had done nothing in the name of the king, but only in her own; and that he might disavow and undo what she had done, as his majesty was no party to the acts. The despatch concluded with an earnest solicitation that his majesty would not delay his journey to the Low Countries till the spring, but come immediately to Brussels.

Philip received the despatches at Segovia, where he was confined by sickness; and though he read and remarked upon them, no answer was returned till he was enabled to remove to Madrid and assemble his council. In that council it was seen that the vice-regent had in no way committed his majesty, and the answers were dictated under that assumption. Two despatches were drawn, one of them ostensible and the other secret. They are to be found at length in Strada, and the substance of them may be thus abridged. The first or public letter announced the birth of an infanta, and that the king had removed to Madrid to make the necessary preparations for his journey to Flanders; that a convocation of the states would be no remedy for the existing evils, but an injury to the honour and the conscience of the king; and that the best measure, in case of necessity, would be to repel force by force, in which circumstances she might securely count on the aid of the well disposed people. The secret despatch was more laconic. It enjoined attention to former orders, and to the public letter, on what related to the convocation of the states-general; and if any force was exercised towards the government, to trust to God and his providence, but to do nothing that should appear, either directly or indirectly, to have proceeded from the opinion of the king.

It was the policy of the court of Spain at this period to keep every thing in the Netherlands in a state of total suspense. For this purpose rumours were spread of the king's intended journey. The time was fixed, the preparations were made, the route was determined, and the attendants were named. It was however only a kind of grimace, though, to give it more the appearance of reality, application was made to the king of France for permission to pass, and also the Duke of Savoy was consulted respecting the fittest passage over the Alps, in case the king should proceed to Italy by sea. These measures satisfied almost the whole of the inhabitants that their sovereign would speedily appear amongst them. The Prince of Orange alone was not deceived. He had emissaries of talent in Madrid, in Rome, and in Vienna, and indeed wherever important intelligence could be obtained. In 1565 Catherine de' Medicis, with her son Charles IX., had a meeting at Bayonne, to which King Philip and his queen, a daughter of Medicis, were to have repaired. The king, however, did not join them, but the queen did. It was represented as a mere family party, at which the ambassadors of other states were not expected to attend. At the meeting the females concocted a treaty between the two kings, which was to be kept secret from all but themselves. It engaged to extirpate all heresy and heretics, not only from their own dominions, but from all the other parts of Europe in which Protestantism had already been embraced. The secret was well kept, and the meeting was attributed to some projected family marriages, which Philip represented to his ministers as a matter which would be best arranged by the females. Walsingham, the ambassador at Paris of Queen Elizabeth, within little more than a year gained the particulars of the treaty, and communicated them to his court, and thence the knowledge of it was conveyed to the Prince of Orange, who maintained the most profound secrecy till the most useful moment for its being made known had arrived.

It was generally believed that the prince had the most complete knowledge of what passed in the cabinet of King Philip, though it is now unknown if, as some suspected, he had the intelligence from his son Don Carlos, or, as others imagined, from one of his secretaries. It is said, that from his perfect knowledge of the transactions and opinions of the French court, and of what had passed at Bayonne, he had predicted the massacre of Saint Bartholomew, and had informed the Admiral de Coligny of the plot, putting him on his guard against the caresses and the treachery of the court, but which, unfortunately for the illustrious victim, did not save him from the miserable fate which he at length suffered. The Prince of Orange was possessed of large estates in Germany, and, by blood as well as by marriage, was closely connected with many of the smaller sovereigns of that country, who had embraced and introduced into their dominions the doctrine and the worship of the Protestants. Even the emperor, though a firm adherent of the Roman Catholic church, was in some measure influenced by him. He was induced to write to King Philip, expressing his good will, but pointed out to him that he was engaged in a war with the Turks, that a great part of Germany interested itself in the fate of the Netherlands, and that those who had adopted the confession of Augsburg would never allow the inhabitants of these provinces to be oppressed. He therefore recommended a negotiation with Orange, Egmont, and Horn, and offered his mediation to accommodate the differences. The court of Spain rejected this interference between the king and his Flemish subjects; but the knowledge of this correspondence served to strengthen the purpose of the Prince of Orange, who soon became acquainted with it, to adopt the precautionary measures which his situation required.

The Prince of Orange having learned, by his emissaries at the court of Madrid, that the preparations for the king's journey to the Netherlands were merely adopted to quiet and mislead the public, and that, on the contrary, it had been determined to pursue the most rigid measures, and intrust them to the Duke of Alba, determined on his course of action. He immediately resigned all the offices he held in the Netherlands, and withdrew himself and his family to his territories in the duchy of Nassau in Germany.

The Duke of Alba was reputed in that age to be cruel, crafty, proud, and avaricious; and his name was held in abhorrence throughout the Netherlands. Although it was resolved that he should have the sole power, yet the purpose was concealed even from the regent herself. Philip continued to assure her that he was resolved to come as soon as possible, and that the Duke of Alba only preceded him, to smooth the way, and so arrange affairs that he might on his arrival the more easily restore tranquillity; that in the mean time the duke would command the army, and attend to the fortifications, and the security of the country, but still in subordination to the authority of her highness. The knowledge of this appointment could not be long kept secret, and its disclosure produced universal consternation. The great nobles, such as the Prince of Orange, the Counts Calembourg, de Bergh, Bredcrode, and others, had early sold parts of their estates, and raised money by mortgages on the other portions of them. All that could, prepared for their removal. The inferior nobility, the rich merchants of Antwerp, the wealthy burghers of all the cities, resolved to expatriate themselves and their families. Soon after the mission of Alba was publicly made known, the duchess wrote to the king to say, that already more than one hundred thousand persons had abandoned their domicils and their country. The Low Countries were at that period at the height of prosperity. The cities were opulent and contiguous, the towns, villages, and hamlets, resembled the cities of other countries, and almost touched each other. It was most densely peopled, and so cultivated that no waste land was to be seen. The commerce was active, and the inhabitants, from industry, were easy in their circumstances, well fed and well clothed. They were the objects of envy to strangers, and viewed with peculiar jealousy by the Spaniards, who saw their condition, and compared it with that of their own country.

The emigrations caused by the first intelligence of the approach of Alba alarmed the duchess, who issued edicts designed to tranquillise the people, and these had some effect; but they were disavowed by orders of the king, and some who had been induced to return were subsequently the victims of their confidence. Afterwards, when the severities of Alba began to be exercised, the emigrations were increased; and though orders were issued to prevent it, and intrusted to the Spanish troops to execute, they came too late. A great number of families had expatriated themselves, and taken with them whatever of their property they could save. Those who were left were chiefly artisans, who could find no employment when their masters had forsaken them, and were thus compelled to seek the means of subsistence elsewhere. A great part of such as were capable of bearing arms joined the Prince of Orange, or enlisted in the armies which the princes of Germany created. Others of them sought an asylum in the imperial cities, and there exercised their trades. Some threw themselves into the Walloon country and into Picardy, for the interior of France was then in greater commotion than even Flanders itself.

The greatest removals however were to England, where, by the orders of Elizabeth, all the ports were open to them, where their property was protected, and where they introduced new fabrics of various kinds, and established those manufactures which have become in process of time the foundation of the commerce and the wealth of our country.

The Duke of Alba, in 1567, embarked with his army at Barcelona, and landed at Genoa. After some stay at Milan, he passed the Alps by Mount Cenis, and proceeded to Franche Comté by the frontiers of Burgundy and Lorraine, and arrived in the beginning of August at Luxembourg, whence he proceeded to Brussels, and entered that city on the 22d of the same month. At his first appearance his conduct convinced the duchess that he was come to exercise supreme power, and in a short time she withdrew from the government. He conducted himself in a most caressing manner to Horn and Egmont, consulted them on military subjects, and especially in constructing fortresses at Valenciennes, Antwerp, and Groningen; but suddenly at the council arrested them, consigned them to separate prisons, seized all their papers, and obtained possession of their money, jewels, and other valuable effects.

When the duchess had quitted Flanders, Alba proceeded with his more violent measures. In January 1568 he erected a judicial tribunal, well known in the annals of the country by the Flemish name of *Bloet-Raet*, or sanguinary council. Alba was himself president, and Vargas, a Spaniard, vice-president. The other members were neither of the privy council nor of the council of Brabant, but, with the exception of two persons who never took their seats, consisted of individuals on whose concurrence Alba could securely rely.

This tribunal commenced by citing before it all the nobles and the citizens, whether absent or present, whether living or dead, who had signed the compromise, such as the Prince of Orange, the Counts of Nassau his brothers, the Counts Hooghstraete, Calembourg, and Brederode, and even the Marquis of Berghes, who was deceased. The Prince of Orange, who had decided on his part, replied in terms of defiance. He asserted that he was a member of the German empire, and as such answerable before none other than the emperor himself; and that, as one of the Spanish order of the golden fleece, he could only be judged by the king when holding a chapter of that order. The others made replies rejecting the authority of the new tribunal, and avowed their junction with the forces which the Prince of Orange was collecting.

The citations were numerous, but the most detailed account is that preserved at Ghent. One hundred and fifty persons, consisting of nobles, patricians, and burghers, were summoned on fixed days to appear at Brussels. Of that number only eighteen presented themselves, the others having emigrated or being concealed. These, conscious of their innocence, were allowed to defend themselves before the tribunal, and were then bound two and two together, and thus marched to prison. The process was not long deferred; they were condemned to death, and perished on the scaffold, some by the sword, others by the halter, according to their respective ranks. Numerous other prosecutions, which terminated in death and confiscations, were carried on towards persons in Ghent; and if the number executed in the whole of the country were in the same proportion to those in that city, it may be true which Alba is said to have boasted on his return to Spain, that more than eight thousand persons had perished on the scaffold during his government of the Netherlands.

The executions of the Counts Egmont and Horn were deferred till June, when, by a process not to be justified by any law, they were condemned to suffer death. They were brought from their confinement in the prison of Ghent, surrounded by two thousand Spanish troops, and decapitated in the Place de Sablons, at Brussels, on the 5th of June 1568. The illegality of these executions was loudly complained of, and produced a great effect over the whole of Europe. Even the emperor and the other Catholic princes loudly condemned the proceeding, whilst many of the Protestant princes were induced by it to lend their aid to the confederation which the Prince of Orange was forming to avenge his friends, and to rescue the country from the miseries it endured.

The army which Alba brought with him from Spain, with some additions on the way, amounted to 20,000 men, one half of which consisted of Spanish infantry, who were in that day considered as the best troops in Europe. They were well disciplined and well commanded, but were much disposed to mutiny, especially when, as was often the case, their pay was in arrear; and this disposition was afterwards often displayed in the most critical circumstances, to the great injury of the service in which they were employed. The desolation of the provinces, and the horrid cruelties which had been perpetrated, at length gave birth to that ruinous and obstinate civil war, which continued so long that none of those who commenced it lived to see its termination.

When the Prince of Orange retired into Germany, he had wished to have collected a force which might have harassed the army of Alba during the march from Italy to the Netherlands; but the princes of Germany were not so alarmed at the prospect of the danger which threatened them, as to assist him to such an extent as he deemed necessary for his purpose, and Alba with his army entered without molestation. The prince had time in his retirement to form his plans deliberately, to calculate on future probabilities, and to be ready to act when the moment for action should arrive. The first cruelties of Alba made a deep impression on all the Protestant princes of Germany, and this impression Orange was skilful enough to turn to his advantage. By the deaths of Horn and Egmont such indignation and resolution were excited in them, that they offered to Orange their wishes, their councils, their troops, and, what is almost incredible, their treasures. Amongst the most prominent of these was the Prince Palatine, with whom the Prince of Orange held a secret meeting at Strasburg, at which some of the leaders of the Huguenots in France were present. Even the Catholic princes were so inflamed at the treatment of Horn and Egmont, that, if they did not assist, they did nothing to impede Orange in his negotiations. The assistance thus obtained, with the aid of a pecuniary nature from Queen Elizabeth of England, and recruits from the Protestants of France, enabled Orange to take the field.

The prince was straitened for money; and his army, though numerous, was badly composed. The Germans and the French were new levies, hastily raised, eager for booty, and in general ill disciplined. Though they were not subject to his sole command, he could not safely disgust them, nor could he allow them to plunder. He knew, too, that at the end of the campaign these succours would quit him, because he was not in a situation to maintain so numerous a body. The greater part of the fugitives from Flanders were destitute, and the prince foresaw that these must soon become a charge which he would be unable to bear.

With forces of such motley composition, Orange determined on a bold and sudden attempt to enter the country on one side or the other, and to sound the tocsin over the whole of the Netherlands. On this plan he formed four bodies, to enter the country at different points. The first of them was to penetrate on the side of Liège, and to enter Gueldres. It was commanded by Count Hooghstraete, the only nobleman of distinguished rank who had been so fortunate as to escape from the fangs of the Duke of Alba. The second corps consisted of the French Huguenots, commanded by De Cocqueville, and they entered into Artois. Neither of these corps were strong, nor do they appear during the whole campaign to have effected any other object than, by skirmishing, to have distracted the attention of the enemy, and thus kept him from strengthening the more important points. The third corps was better composed and more numerous. It was commanded by Prince Louis of Nassau, brother of the Prince of Orange. It commenced the war by entering Friesland, where he was opposed by the king's army under the Count Arenburg, whose force was augmented by Spanish infantry and cavalry. When in presence of the enemy, he was forced to give battle, by the taunts of the Spaniards, who accused him, from his being a Fleming, of favouring the party of Orange. He led his troops to the combat, and fell in the attack. His army was completely defeated and dispersed, with the loss of its cannon, baggage, and a large sum of money which was destined to pay his troops, as well as others then in Groningen. The Frisian peasantry put to death the fugitive Spaniards; but the Germans and Flemings, who were mixed with them, were either liberated or joined the victorious troops.

The Duke of Alba was at Brussels when this disastrous event happened; and instantly, after venting his rage by numerous judicial assassinations, he repaired, with what troops he could collect, to Groningen, where he was joined by the garrison of that city. The troops of Prince Louis amounted to 12,000 or 14,000 men, and that of Alba was nearly of equal number; but the army of the latter was well trained and well disciplined, whereas that of the former was a mass of strangers, difficult to restrain, with little experience and less discipline, disposed to mutiny for want of their pay, and ready to desert their colours after any reverse. Prince Louis found it necessary to retreat from Winschotten, where he had gained his victory, and remove into the German province of East Friesland. He took up a position defended on one side by the river Ems, and on the other by that bay of the Zuyder Zee called the Dollart, and having at his back the city of Embden. He threw up intrenchments mounted with cannon in his front, and with better disciplined troops might have maintained himself till his brother the prince, who was advancing with a numerous force, could arrive to his relief. Alba pressed eagerly forward, and, at his approach, the troops of Nassau broke out into mutiny; and though it was partially quelled, a body of auxiliary troops who had joined it from Oldenburg, instead of waiting the attack within the lines, rushed out without orders, and threw themselves upon the Spaniards, by whom they were cut to pieces, and the opening thus made was entered by the enemy. The route became complete, and the Spaniards were amply revenged for the late disaster at Winschotten. Many of Nassau's troops were killed, more were drowned in the Ems, the cannon, colours, and baggage were captured, and the prince with a few of his followers threw themselves into the city of Embden, whence, from their knowledge of the country, they succeeded in making good their retreat.

Whilst these transactions were passing on the eastern side, the Prince of Orange had been collecting his fourth and principal army on the western side, and mustered, about Aix-la-Chapelle and Liège, a body of nearly 28,000 men, which in that age was a large army. Being much superior in number to the army under Alba, the Prince of Orange was desirous of a battle, and made all possible attempts to bring it on. But the Duke of Alba, knowing the nature of his enemy's forces, and that it was beyond his power to keep together so large a body from one season to another, acted purely on the defensive. This course he adhered to with firmness, though often urged by his officers and troops to lead them to battle. The campaign was thus passed with no other operations than occasional skirmishes or advances and retreats. The prince was compelled to dismiss the greater part of his forces, and to retire, with the few left to him, into winter quarters, when Alba did the same, and both were actively employed during the winter in the necessary preparations for the following spring.

The events which caused and accompanied the commencement of the troubles in the Netherlands have been related in a more circumstantial and detailed manner than our limits will allow to the subsequent proceedings. After the first indecisive campaign, there was a kind of suspension of hostilities, from the exhaustion of the opposing parties. Alba was employed in extorting money from the public bodies, and from individuals, to an unheard-of extent, and with intolerable severity. One demand was called the tenth denier, by which one tenth of the amount of all sales were to be paid; a tax which served to impoverish the country, to suspend all industry in trade, and which ultimately tended to exasperate the inhabitants, and throw them into the arms of the insurgent party. The Prince of Orange, on the other hand, was occupied in negotiating treaties with the German princes, who assured him of succours both of troops and treasures. He also visited France, where Admiral Coligny, the chief of the Protestant party, after promising his aid, suggested to him the idea of creating a naval force. This was instantly adopted, and a party of sailors, of those called Gueux-marins, seized upon Briel, a town on the island of Hoorn, by which they secured an asylum for the shipping, and whence they gradually extended their conquests to the other towns and cities which command the entrance to the ocean, and secure those places from naval attack. This was the first step in the formation of that naval power by which the Hollanders became ultimately enabled to secure their independence. Seamen from all parts flocked to the maritime towns as rapidly as they declared for the Prince of Orange; and in Dort, Flushing, Rotterdam, and, indeed, all the places where there were no Spanish garrisons, they joined the prince. Fleets were equipped, which seized on all the Spanish vessels they met with, even in the British Channel, and kept open a communication with the ports of England, whence, by the proceeds of the captures, they could procure stores, arms, and ammunition, to carry on their warlike operations. The growth of the naval power was so rapid, that within three months after the capture of Flushing, no less than one hundred and fifty sail of armed vessels, well manned and equipped, were despatched from that place alone. The canals and rivers which intersect the country were filled with barges and gun-boats, which landed at the Spanish posts, and carried away arms and other effects from the very gates of Ghent and Bruges.

Alba, who was busied in extorting the tenth penny, looked with contempt on the seizure of Briel; but soon awoke to the consequences, and began to draw together his troops to punish the Gueux-marins. His attention was, however, too powerfully drawn to another quarter, and they were left without molestation. The Prince of Orange, the moment he knew himself secure of the naval asylum, began his land operations. At the head of 20,000 men he entered Gueldres, seized Ruremond, Tongres, St Trond, and Tirlemont, and entered Louvain by treaty, where he rested. His brother Louis, aided by 7000 French Protestants, chiefly cavalry, entered Hainault, and surprised the important city of Mons. Another corps under Count de Bergh entered the province of Overyssel, and seized Zutphen, Gorcum, and some smaller places. Alba was alarmed at these events, but more at the apprehension that it was not merely the French Protestants, but the French king, who had become the ally of Orange. He turned his attention, first of all, to the recapture of Mons, and after a siege of three months took it on capitulation, a division of the main army which was proceeding to raise the siege having been defeated. After the capture of Mons, Alba collected his forces, and led them to attack the city of Haerlem, in the province of Holland, as preparatory to the conquest of the other maritime positions. That place, defended chiefly by its citizens, made a noble resistance; but after a siege of seven months, in which the exertions and the sufferings of the inhabitants appear almost incredible, it surrendered, and was delivered over to the vengeance of the irritated and unfeeling Spaniards. In this siege, carried on in an aquatic district, and in the winter months, the besiegers suffered severely, especially as they were ill supplied with provisions. Their sufferings and their want of pay caused a mutiny after the capture, which paralyzed for a time the operations of Alba, whilst the Prince of Orange was carrying on the siege of Middleburg in Zealand, which was ably defended, and only surrendered after a siege of two years duration. The states of Holland and of Zealand had been assembled at Dort, where, notwithstanding the republican jealousy which prevailed, powers almost unlimited were conferred on the Prince of Orange, and a kind of government constructed to manage the affairs of these two provinces.

We have thus sketched the outline of events from the end of the year 1568 till the end of 1573, at which time the court of Spain had recalled Alba, who departed with enormous wealth, and the curses of all classes of the people, in January 1574. He was succeeded in the government by Don Louis de Zuniga of Requesens, but generally called by the latter name. When Requesens assumed the government, he found the affairs of it, in those parts still under the Spanish power, in a dreadful state of derangement. The people were universally disgusted, the army in a state of mutiny, and the finances absolutely exhausted. Though intrusted to adopt a milder system of government, and actually issuing an amnesty, he could not overcome the deep hatred to his country which the Flemings had conceived. He naturally followed the military plan which had been traced out by his predecessor. The Prince of Orange had carried on the siege of Middleburg nearly two years, and Requesens resolved to attempt its relief. His naval forces were collected, and a battle ensued, in which the Spanish fleet was defeated, and most of the ships taken, burned, or sunk. This occurred on the 19th of January 1574, and was followed by the capitulation of the city on the 19th of February. The garrison, the ecclesiastics, and such of the burghers as wished it, were allowed to proceed to Flanders. This treaty was the commencement of a milder treatment of prisoners on both sides, and henceforward the contest assumed a more humane form. The capture of Middleburg was important, as it decided the fate of the province of Zealand, which was soon rendered unassailable by the Spaniards, whose naval force was far inferior to that of the Prince of Orange. Requesens sent a corps of his army to attack a force under the command of Prince Henry of Nassau, over whom a victory was gained, on the 14th of April, near Nimeguen; but a mutiny immediately broke out amongst the Spaniards, and rendered the success of no value. When the mutinous spirit was somewhat allayed, the Spaniards besieged Alckmaer, but were received by the inhabitants with such resolution that they gave up the attack and concentrated their forces to besiege the city of Leyden. It was carried on with great vigour, and defended with skill and bravery; and after the besieged had for nearly six months endured all the horrors of famine and disease, by cutting some dikes the Spanish camp was covered with water, more than a thousand of the assailants were drowned, and on the 3d of October the siege was abandoned. This secured to the party of Orange the freedom of the province of Holland, as the capture of Middleburg had done that of Zealand. The Spaniards were thus expelled from every part of those states except the city of Amsterdam, of which they did not quit possession till four years afterwards.

After defeat or after victory the Spanish troops were equally accustomed to mutiny. The repulse before Leyden begot this spirit, which displayed itself by deposing their commander Don Sancho de Avila. They chose one of their own number as a leader, and carrying with them Don Sancho, bound hand and foot, proceeded towards Utrecht, where by plunder they boasted they would pay themselves the arrears owing to them, and they committed the greatest excesses on the small towns which they were able to seize upon. At length some money was paid to them, the mutiny was appeased, and Requesens led them to make attacks on some of those islands which compose the state of Zealand. These were all repulsed by Prince Louis; and Requesens, who had superintended the operations in person, at length abandoned all attempts. He was called to Brussels by a mutiny of the Spanish cavalry in that city; but on the day of his arrival he was attacked by a fever, which in a short time terminated in his death.

This brings the events down to the end of the year 1575, at which period an attempt at conciliation was made by the emperor of Germany. A congress was held at Breda, where an ambassador from his imperial majesty, the two brothers of the Prince of Orange, the pensioner of Holland, deputies from Zealand and Gueldres, and two ministers of the king of Spain, met; but nothing was agreed on, after three months spent in negotiation, as the preliminary question of religion could not be settled. The king would only admit of the Catholic faith, and the opposing parties as resolutely maintained that of the reformed church.

In 1576 the Prince of Orange succeeded in the plan he had long formed, of forming such a union between the two states of Holland and Zealand as should concentrate their efforts for the common defence, by placing in his hands, under the name of regent for the king, the whole executive power. This arrangement, concluded in April, was announced to all the cities, and accepted by them; and the prince having taken the oath of fidelity to the privileges of the states, assumed the government, and arranged the administration with judgment, despatch, and economy.

At the same time, within the provinces still belonging to Spain, the death of the governor created the greatest confusion and disturbance. The council of state, consisting chiefly of Flemings, assumed the administration, and, as soon as an answer to their communications could be received from Madrid, were confirmed in that power, but only *ad interim*, until Don Juan of Austria, who was named governor, should arrive. Though composed of only nine or ten members, this council soon became divided into factions, which thwarted each other; they were without pecuniary resources, and could take no measures to remove the difficulty. The consequence of this was, that the Spanish troops, being unpaid, broke into furious mutinies, and, with the pride of their nation, rejected the authority of the council, deposed their officers, chose one of their own number, who was called *Eletto*, indulged everywhere in the most unlimited plunder, and committed the most atrocious barbarities. The movements made by these troops alarmed all the inhabitants of the cities, so that even in Brussels itself the council could scarcely have been in safety without yielding to the impulse of indignation which was displayed by all orders of the citizens. The mutinous troops had taken by storm the fortified city of Alost, between Ghent and Brussels, when the council, on the 29th of July, issued a placard denouncing the Spaniards as rebels to their king and the country. They were depicted as mutinous traitors, and the people of the Netherlands were called upon to exterminate them wherever they were to be found; they were also forbidden to supply them with provisions, and commanded to remove out of their way all money and other valuable effects.

The insurgent army at Alost alarmed the city of Ghent, where the inhabitants had armed themselves; but the castle which commanded the town was held by some Spanish troops, who were in connection with the mutinous army. It was of importance to take the castle; and a party in that place, where the Prince of Orange had numerous secret friends, made application to him for assistance. He, who had foreseen the event and was prepared to meet it, despatched from Zealand eight bodies of infantry, amounting to about 3000 men, with seventeen pieces of artillery, under the command of Colonel Temple, an English officer in the service of the states, who entered the city on the 26th of September, and having formed the siege of the castle, caused it to surrender on the 11th of November.

The possession of Ghent was the signal for a general movement amongst the Flemings. In spite of the orders of the king positively forbidding it, the states assembled in each province, and the feeble and divided council gave way before them; and thus the power was vested in a body, who confined some, displaced others, of the council, and changed the government into that republican form which the seven provinces that ultimately obtained their independence afterwards adopted. The king's name was used, but his power was for the time abolished. The new government sent its envoys to the several courts to implore assistance. The emperor and some other princes answered with cordiality, and offered their mediation to effect a general pacification. The king of France (Henry III.) spoke plainly, and showed good will, but said that his opponents, the Leaguists, supported by the pope and the king of Spain, had so embarrassed his affairs as to deprive him of the power of rendering them any assistance. Queen Elizabeth of England received the envoy, Baron Sweveghau, with much distinction. She granted to the states a loan of one hundred thousand pounds sterling, of which forty thousand were immediately paid in uncoined silver, and the remainder was made payable at Brussels by her ambassador. The cities of Ghent, Bruges, and Nieuport were securities for the money; and the states agreed neither to make truce nor peace with Spain without England being comprehended in it. The other conditions were, that the English merchants should be restored to the privileges which they had enjoyed before the troubles, and that the subjects of England who had been banished should not be protected within the territories of the states.

A treaty was soon concluded at Ghent, and ratified at Brussels, between the states on one part, and the Prince of Orange in the name of the states of Holland and Zealand on the other. The chief stipulations were, that the contracting parties should unite to drive all Spaniards from their countries, and then assemble as in states-general before 1555, to regulate the affairs of religion, of the fortresses, and the ships of war; that no attempts should be made against the Catholic religion; that all the ordonnances issued by the Duke of Alba should be suspended till they were confirmed by the states; and that in the mean time the Prince of Orange should retain his power as stadtholder of Holland and Zealand. This treaty was signed in the name of the king, and in a short time was acceded to by those other provinces not represented in the states assembled at Brussels.

Whilst these transactions were in progress, the Spanish troops, though diminished in number by their own excesses and the vengeance of the country people, continued in the same mutinous condition. One division of them took Maestricht by storm, and there perpetrated the most abominable injuries to persons and property. Two other divisions, one from Alost and the other from Zealand, united to seize on the rich city of Antwerp; and with them joined the portion of the garrison of the citadel of Antwerp which had cut its way through the besieging army. The citadel was in possession of the Spaniards; and as soon as the rest of the mutineers had been received into it, they stormed the city, which, though bravely defended, was ultimately overcome, a great part of it being burned in the conflict, and what remained, as well as the persons of the inhabitants, became a prey to the infuriated and merciless mutineers. Destruction was thus inflicted on the most flourishing commercial city of Europe, from the effects of which it has never since recovered. The destruction of that city was, however, one of the causes, and not an inconsiderable one, of the rapid progress in foreign commerce which was made in Holland during the subsequent prosecution of the long protracted war, and supplied much of the pecuniary means by which that war was maintained.

Don Juan of Austria, who had been appointed to the government of the Netherlands on the death of Requesens, was a natural son of the Emperor Charles V. who had ordered him to be educated in secrecy, but suitably, according to a respectable station in life. The history of his birth had been concealed from him until he had arrived at maturity, when King Philip himself unexpectedly revealed it, and acknowledged him as his brother. At an early age he had been employed against the Moors of Granada, and had by his successful exertions gained great applause; but the chief ground of his high reputation arose from the naval victory of Lepanto gained over the Turks, when he commanded the united fleets of the Christian world.

When nominated to the command he was residing at Milan, but instantly departed from thence to Spain, where he received his instructions from the king. He was directed to treat the Netherlands with great mildness at first, but to commit himself to nothing definitive, and on no account to give up any of that unlimited power which the king was firmly resolved to exercise. It was commonly believed that the king gave him an assurance, if he succeeded in restoring the Netherlands to submission, that he should be supplied with forces to land in England, where he should release Mary Stuart from her prison, place her on the throne of Elizabeth, and by a marriage with her become monarch of the British islands. Don Juan rode post through France, at that time in a state of confusion, in the disguise of a servant to one of the nobles who accompanied him, and at length reached Luxembourg on the day on which the mutinous army of the Spaniards had stormed the city of Antwerp. On his arrival there, the disastrous state of the affairs of Spain, which has already been described, seems to have left him no other alternative, after announcing his arrival to the states, than that of acquiescence in the decisions of that body, conjointly with the Prince of Orange. He accordingly gave his assent to the pacification of Ghent, and to that article of it which stipulated the removal of all foreign troops from the country of the Netherlands. Some confidence was thus gained with the states-general, but none with the Prince of Orange, with whom Don Juan had opened a correspondence of an apparently amicable and confidential nature. The troops were in appearance disbanded, or marched away. The Spaniards moved slowly towards Italy, from whence they could be recruited. Some of the auxiliaries were said to have been lent to the Leaguists in France, so as to be within call when needed. In a few months, which were passed in conciliatory measures, Don Juan, rather by fraud than by force, obtained possession of the strong castle of Namur, in the month of July, and established his court in that city, where he soon began to collect troops. This caused an alarm in the states, and they also began to collect their forces. The Prince of Orange was invited to repair to Brussels, in order to concert with the states the measures requisite for the defence of their freedom. Negotiations were begun with insincerity on all sides, for neither could trust to the assurances and engagements of the other. The Prince of Orange, who had entered Brussels on the 23d of September, was consulted on these negotiations, and was in some sense a party to them; though he foresaw, from the very moment of Don Juan's arrival, that no secure treaty could be formed, and that the sword must decide the issue. The states, at the suggestion of the Prince of Orange, had decreed the demolition of those fortresses which commanded the cities, especially those of Antwerp, Ghent, Utrecht, Groningen, and Lisle. This was the signal for hostilities. Don Juan had recalled the troops on the march for Italy, and those lent to the party of the League in France. The Prince of Parma brought other reinforcements; and thus Don Juan found himself at the head of an army of nearly 20,000 at the end of the year. The army of the states consisted of nearly equal numbers. They were, however, inferior in discipline and in good officers to the forces opposed to them. The two armies were in presence of each other in December. The army of the Spaniards had been so secretly collected, that the states believed that their own troops much outnumbered them, and from this impression gave orders for the attack. On the 31st of January a bloody conflict took place at Gembloux, near to Namur, in which the Spanish force was victorious. The army of the states suffered very severely; their general, Goignics, with many of his men, were made prisoners, and the remnant retreated towards Brussels. The Prince of Orange and states removed from thence to Antwerp. Don Juan, instead of pursuing them, followed up his success by capturing the smaller fortified towns. In the course of the year 1778, he had taken Louvain, Tirlemont, Bovines, Diest, Nivelles, and some smaller places. These conquests were effected by detachments, whilst his main body was encamped near Namur. But he was taken ill in September, and died on the 1st of October 1578. The cause was probably a pestilential fever, but, according to the custom of that age, was most commonly attributed to poison. On his death-bed Don Juan nominated as his successor his nephew the Duke of Parma, who had recently joined him. He was a young man of highly-estimated talent, the son of that duchess who had long been the regent of the Netherlands, and under whom the troubles had commenced.

When the Prince of Orange had retired to Antwerp, he clearly perceived that, from the nature of the country, and the confidence placed in him by the people, he could preserve a secure asylum for liberty in Holland. His means did not extend to the other provinces of the Netherlands with the same commanding effect. He therefore turned his chief attention to that which, with a concentration of his means and exertions, could with most probability of success be attained.

As the ten provinces were at length all brought under subjection to Spain, and finally were transferred to the house of Austria, the transactions relating to them do not appropriately belong to the history of Holland, and will therefore be only so far noticed here as regards their connection with that country.

It was the policy of the Prince of Orange to keep alive the spirit of opposition which still existed in Flanders, because it gave employment to the troops of the Duke of Parma, and time to the inhabitants of the United Independent Provinces to prepare for that firm defence which must be the only means of securing their ultimate independence. Those states also gained much in another view. Holland was a secure asylum, and the inhabitants of the other ten provinces found refuge there, when neither tranquillity nor security could be enjoyed at home. At this period, many of the richest of the traders once more removed their families and their property to the cities and towns of Holland and Zealand. The ruins of the commerce of Antwerp were collected in Holland and Amsterdam, though the last place, from which the Spaniards had been driven out in 1578, received the greater share of it.

Whilst Flanders was torn to pieces by the contest between the troops of the Duke of Parma and those raised by the states, the United Provinces assumed in their temporary tranquillity a more imposing aspect. The important province of Utrecht joined the party of Holland, Zealand, and Friesland. The war had been carried on against the king of Spain without explicitly renouncing allegiance to him. But after the accession of Utrecht, the declaration of their independence of the authority of that monarch was promulgated. This gave confidence to the inhabitants, and admitted them to treat as sovereign states with any of the other governments of Europe. To these four provinces the three small ones of Zutphen, Overyssel, and Groningen were added, and thus formed a compact and easily defended district. They assumed for their arms a bundle of seven arrows, with the motto, *Concordia res parvæ crescunt, discordia maximæ dilabuntur.*

We pass over the endeavours made to establish the Duke of Anjou, brother of the king of France, as the governor, the wars subsequent upon it, and the attempts made to assassinate the Prince of Orange, because they belong rather to the history of Flanders than to that of Holland. It may, however, be proper to remark, that in the intercourse between that duke and the prince, the latter favoured the pretensions of the former; but he seems to have done it without any prospect, perhaps without any hope, that it would do more than operate as a diversion in favour of the seven United Provinces, to whom his chief regards were always directed.

From the death of Don Juan of Austria, at the end of the year 1578, to July 1584, the state of Flanders arrested all the efforts which Spain could make to attack Holland; and the inhabitants availed themselves of it to extend their commerce, to increase their ships, to economize their resources, to accumulate warlike stores, and to organize and discipline the whole of the male population. Spain was too much engaged with other objects to direct any strenuous operations against Holland, calculating that if she could subdue the ten larger and more populous provinces, the submission of the other seven would either necessarily follow, or might be easily enforced. Besides, she was at that time making preparations for the enormous naval force called the Armada, with which she calculated on conquering England, and thought that by that achievement Holland would fall under her power.

The intense personal hatred which existed between Philip of Spain and the Prince of Orange gave birth to the most virulent and threatening manifestoes, which were printed, diffused, and read throughout Europe; and the king even made it generally known, that whoever should succeed in assassinating the prince, should receive a reward of 80,000 ducats, be made a commander of the order of St Jago, and obtain patents of nobility. These offers, stimulated also by religious fanaticism, induced many individuals to arm themselves for the horrid deed. One of them, Geerardt, a Burgundian, gained access to the prince by means of letters from Count Mansfeldt, and, as he was passing from his dinner table to another apartment, shot him with a pistol concealed under his cloak, which discharged three balls into the breast of his victim. The prince fell, exclaiming, "I am wounded. Lord, have mercy on me, and on this poor people!" He then immediately expired. The assassin was taken and executed. The recompense for the detestable deed was subsequently made to his family; for, in the register of the court of Madrid of the 4th March 1589, patents of nobility are entered as conferred on his brothers and sisters, who are described as bearing that relation to Geerardt, a tyrannicide.

This tragical event occurred on the 10th of July 1584, at Delft, where the states of the seven provinces were then assembled. It inspired courage rather than despair among the patriots of Holland. The eldest son of the prince was a prisoner in Madrid, where he had been detained from the commencement of the troubles. His son Prince Maurice was instantly invested with all the power of his parent, though only eighteen years of age; and Count Hohenlohe was appointed with the character of his lieutenant.

The Dutch attempted to enter into negotiations with those powerful princes who were hostile to Spain. The application to France was made at a time when the power of the confederation of the League was so formidable as to preclude the prospect of any aid. Henry III. received the deputies with respect, but recommended them to make application to Elizabeth of England. Offers were made to her of the sovereignty of the Netherlands, which she declined; but she made a treaty stipulating to furnish six thousand troops to be maintained by her, and was to have Flushing, the Brill, and the castle of Rammekins, as pledges. Leicester, her favourite, was appointed to the command, and was to have concurrent power with two members chosen by the states in all military affairs, but was not to intermeddle in the civil transactions.

The imprudence or ambition of Leicester gave much umbrage to the states, and his presence became rather injurious than beneficial to them. The threatening danger from the Spanish Armada, and some degree of disapproval of the conduct of Leicester, induced the queen to recall him and the greater part of the force. The conduct of Leicester had produced the loss of Zutphen and Deventer; but, after the defeat of the Armada, fresh troops were sent from England, and these having drawn the Spaniards towards Ostend, in which was an English garrison, Prince Maurice was enabled to recapture those places. The celebrated siege of Antwerp, though scarcely an operation in which the Dutch were engaged, may be here noticed. It was a long and heavy labour of seven months, carried on by the Duke of Parma in person. During its progress the most extraordinary bravery and skill was displayed by the assailants and the defenders; but the place finally surrendered, and the remains of its commerce were transferred to Amsterdam. After the recapture of Zutphen and Deventer, Prince Maurice, whose forces had been recruited, threatened Dunkirk and Nieuport, and, after a short but vigorous bombardment, captured the important city of Nimeguen, and other towns in that quarter; and these operations closed the campaign of 1592. The Duke of Parma had advanced with an army into France, and left the management of the war in the Netherlands to Count Mansfeldt.

In the beginning of 1593, Mansfeldt issued edicts forbidding all communication with the revolted and now *de facto* independent provinces, and declaring that no quarter would be given to any who did not join him. Such threats were however of no avail, for Prince Maurice having collected his forces, attacked the strong city of Gertruydenburg; and though Mansfeldt, at the head of 12,000 foot and 3000 horse, attempted to raise the siege, he was foiled. The place surrendered on the 23d of June, after suffering the extreme of famine.

The Spaniards were still in possession of the city of Groningen, where Verdugo, an Italian, commanded. The chief operations of the year 1594 were in that quarter. Much time was passed in able manœuvres between Prince Maurice and that general. But the prince having succeeded in cutting off the communication between Groningen and Germany, that city was compelled to surrender in July. The many repulses which the Spaniards had received, and the want of pay, produced a mutiny, and the soldiers threatened to indemnify themselves by the plunder of Brussels, and other towns in the ten provinces under the crown of Spain. The mutineers were in communication with Prince Maurice, but he declined taking them into his service, though the mutiny was turned by him to the benefit of his country.

In the year 1595 a general discontent against their Spanish masters spread itself in the ancient provinces. It was fomented by the Flemish nobility, who, in an assembly convened at Brussels, demanded peace. This affair turned out advantageous to the seven provinces, where Prince Maurice and the states-general were occupied in negotiations both with England and with France, with both of which countries treaties were concluded, in which the Hollanders engaged to supply them with naval forces, some of which assisted Sir Walter Raleigh in his successful attack upon Cadiz.

Philip of Spain, now advanced in years, having become disgusted with the cares of government, his Flemish provinces were placed under the management of the Archduke Albert of Austria. He had under his command an army of 30,000 men, with which he took Calais, and then rather turned his forces towards France than towards the new republicans. The Dutch had by this time grown up into a great naval power. They are said to have had on board of their shipping more than 70,000 seamen. The bloody wars in which they had been engaged seemed to have increased their wealth and their spirit of commercial enterprise. Even their enemy Philip connived at their carrying on a very beneficial trade with his subjects in Spain and Portugal, whilst their cruisers covered the seas, and made numerous captures of the trading ships of those very subjects.

The earnest desire to attain naval superiority which animated the Dutch, was accompanied with a correspondent neglect of their land forces. The arms of France, however, acted as a diversion in their favour, and enabled Prince Maurice in 1597 to defeat one of Albert's generals, and, in consequence thereof, to capture Turnhout, near Antwerp; and in the end of the year, several other towns in that quarter submitted to the states-general. In the same year, negotiations for peace were attempted, under the mediation of the emperor of Germany and the king of Denmark; but the states refused to treat till the king of Spain should acknowledge their independence. The peace of Vervins was concluded between Spain and Henry IV. of France, to the great disgust of Elizabeth and of the United States, who thereby were brought into more intimate alliance.

The commerce of the states was now much augmented. One of their citizens, Balthasar Monchuen, besides trading extensively to India, formed settlements upon the coast of Africa and upon the island of St Thomas. Other merchants sent their ships to the South Seas, through the Straits of Magellan, in the hope of discovering a passage to Japan and China. Companies were formed which sent large ships to the East and West Indies. The trade in the Mediterranean was extensive and lucrative; but, above all, their fisheries on the coasts of England became a mine of wealth.

Though with inadequate force, Prince Maurice, in the winter of 1599, surprised Emmerich on the Rhine, and projected the transference of the seat of war to Germany; whilst Mendoza, the Spanish general, was opposed to him, and invested Bommel; and, though an indecisive battle was fought, Maurice delivered that fortress from the besiegers, and secured his own conquest. After this, party-spirit appeared in Holland, with sufficient fervour to lead to the reduction of the army; but, fortunately for that country, the Spanish troops were so mutinously disposed, that they were unable to take advantage of this diminution.

About the end of 1600, the states were roused to make greater land preparations, and their army under Prince Maurice, in conjunction with an auxiliary English force under Sir Francis Vere, gained the decisive victory of Nieuport, in which the Spaniards lost 5000 men, whilst the loss of the allied army did not exceed 1500, of whom 800 were English. Though Nieuport was invested, Maurice was compelled to raise the siege, when the armies went into winter-quarters. About the end of 1601, some attempts at negotiations for peace were made, but, like those of the former years, they were soon suspended.

The chief military event of the three following years was the siege of Ostend, in which Vere had at first the command; but in the course of the long operations he was relieved, and joined the prince with his troops, who were replaced by the soldiers of the states. The whole attention of Europe was engrossed by the great display of military art in and before Ostend. Spinola the Spanish general was one of the first of the military geniuses of that age, and Vandernoot, who defended the place, was his equal. With an immense loss of life and expenditure of money, after a siege of more than three years' duration, the place was surrendered by capitulation on the 20th of September 1604.

The death of Queen Elizabeth in March 1603, and the accession of James to the throne of England, gave a new turn to affairs. The temper of that monarch was decidedly pacific, and though at first he in some degree adhered to the alliance with the states, his assistance was small, and in some of the transactions rather adverse. The war was continued between the armies commanded on one side by Prince Maurice and on the other by Spinola, but both were so cramped in their operations by the parsimony or the poverty of their respective governments, that no decisive event occurred. The naval war was more effective. The fleets of Spain from the East and West Indies were intercepted by the Dutch. Tremendous conflicts were carried on, by which some of the vessels loaded with treasure from the New World fell into the hands of the republicans; but a much larger portion of the vessels which contained it were either burned or sunk. The failure of remittances so impoverished the king of Spain that he became disposed to treat for peace. The negotiation began in the early part of the year 1607. At first the required acknowledgment of independence suspended it, but in the month of April 1607 Spain gave way, and a suspension of arms for eight months was agreed upon, without any communication of it having been made to the kings either of England or of France. When the eight months had expired, no treaty had been concluded; and, though no hostile movements were made by land, the captures of the Dutch at sea were continued during the prosecution of the treaty. At length a truce for twelve years was agreed to in April 1609. A general amnesty on both sides was stipulated, and a freedom of trade by sea and land, including both the Indies, was agreed to.

This treaty, though only concluded for a fixed period, was yet a termination of the war as between the king of Spain and the seven United Provinces. The states had no sooner attained peace and independence, than they intermeddled with the affairs of the other sovereign states of Europe, and became involved in hostilities with Germany, in which Prince Maurice, on a disputed succession to the duchies of Cleves and Juliers, took the latter city, and garrisoned it. But the Germans having soon afterwards taken Wesel, a termination was put to the contest by the mediation of England and France.

Almost as soon as the states had concluded a general peace, internal dissensions arose. These were maintained by the nature of their constitution, which conferred on each individual state an independent sovereign authority. The first occasion arose from a theological difference of opinion on a topic, of all others, the most inscrutable by the human faculties. The Protestants had imbibed their opinions from Calvin, and had generally adopted his doctrine of predestination. The professors of the universities had advocated that opinion, when Arminius, a native of Holland, was appointed to the divinity chair of Leyden, and taught the opposite opinion of the freedom of the human will. He thus became the head of one sect, whilst a Dr Gomarus, another professor, became the leader of the Calvinistic sect. Theological discussions soon created political parties. Prince Maurice had imbibed the opinions of Arminius, but finding the clergy and the great body of the common people attached to those of Gomarus, he, without regarding the private opinions he held, placed himself at the head of the Gomarists. Barneveldt, the chief civil man in the union, was in opinion a Calvinist; but seeing the nobility and the better educated part of the people supported the system of the Arminians, he became the chief of that party. The acrimony and bitterness with which the contest was carried on soon rendered it of a mixed character, combining religion and politics. Each city possessing within itself independent powers, punished or protected either the Arminians or the Gomarists. Those two eminent scholars Grotius and Vossius defended Arminianism, whilst the synod of Dort, assisted by King James of England and the Archbishop of Canterbury, for a short time maintained the opposite side in the controversy. Prince Maurice, by his influence with the common people, and from being at the head of the army, was enabled in many of the cities to change the magistrates; and when he could not effect that purpose, as at Utrecht, he called in the troops to their assistance. Barneveldt and his party proposed a general toleration of all opinions, and presented a remonstrance to that effect; a proceeding which changed the names, but not the characters, of the party. The Arminians were called Remonstrants, and the Calvinists Anti-Remonstrants, names which have been continued to this day. The party of Maurice, consisting chiefly of the populace of the cities, and their clergy, was ready to tolerate Jews, Mahommedans, and infidels, but would not consent to grant similar toleration to the Remonstrants.

It became evident that the prince was aiming at establishing for himself and his family an hereditary sovereignty over the states; whilst Barneveldt and the higher classes, on the other hand, eager to perpetuate the liberties of their country, formed connections with the court of France, and thence obtained the name of the Louvestein faction, which has been continued amongst the opposers of the absolute power of the house of Orange to the present time. But the Orange party acquired such superiority that Maurice was enabled to seize and imprison the venerable Barneveldt and the learned Grotius, the former of whom, after an infamous trial, when the judges were threatened with death if they did not pronounce the popular sentence, was condemned to death, and beheaded at the Hague on the 13th of May 1619. As the benefactor of his country, he died with the regret of the wise and good of his own time, and has been viewed by succeeding ages as one of the chief authors of the victories, the prosperity, and the liberties of his country. Grotius was still a prisoner, probably not a very strict one. He was allowed the use of books, which passed in a large chest unexamined, and in that chest he was concealed and carried away. He escaped to France, and passed the remainder of his days in an honourable, useful, and upright manner.

The truce was now drawing to a close. The interval which the Dutch had enjoyed had been employed by them, in spite of their internal dissensions, in the most profitable manner. They had prodigiously extended their maritime operations, having been much benefited by the languor of James I. of England, and the ruined state of the marine of Spain. Their ships gave laws from the Baltic to the Levant. They had forced a trade with the Spanish possessions in the western world and in the East Indies; and, besides some smaller acquisitions, they had founded Batavia in the island of Java, which soon became the emporium of the trade of the eastern world.

Philip of Spain died in 1621, just at the time when the truce between him and the Hollanders had expired. The greater progress the Dutch had made in prosperity and power, the more worthy objects of his ambition did he deem them, whom he still viewed as his rebellious subjects. He had instructed his ambassador to propose such terms of peace as were sure to be rejected, which in fact they were, in the most contemptuous manner. But Prince Maurice was not well supported by the states on land. The operations were not of great moment. The Spaniards under Spinola took Juliers, but were repulsed in an attack upon Haerlem. Maurice made an effort to seize upon Antwerp, which failed; and he returned to the Hague, where an attempt was made by a grandson of Barneveldt and some Arminians to assassinate him. This, though it failed, gave great strength and violence to the Gomarists, and they were most unrelenting in their cruel punishments. The rack and the axe were in constant employment, and to be known as an Arminian was deemed sufficient cause for their infliction. The war by land against the Dutch was continued by Spinola, on the side of Belgium; and though he could not prevent them from recapturing Juliers, and taking Cleves, he collected such a force as enabled him to besiege Breda, which was commanded by an English colonel, Morgan. It was an important place, strongly fortified, and of great interest to Prince Maurice, because it formed the centre of his patrimonial estates. It was ably defended, and during the ten months the siege lasted, the loss of the Spaniards was enormous. They however ultimately succeeded, and a capitulation was signed on the 6th of June 1625.

During these operations, Prince Maurice died in the eighty-eighth year of his age. Ambition alone, which had caused his severity towards the Arminians, prevented him from being the most amiable, as he was one of the ablest men of the age in which he lived. About the same period King James of England died, and was succeeded by the unfortunate Charles I. Prince Henry of Nassau was the successor of his brother, as governor of the states of Holland, Zealand, Guelderland, Utrecht, and Overyssel. He continued the military operations against Spinola, but, after the surrender of Breda neither party could boast of having gained much advnatage.

The naval operations in some degree compensated for the languor which prevailed on land. The Dutch sent an expedition to the South Sea, which attacked the Spanish settlements in Peru with much success; and at length they also conquered St Salvador and other parts of Brazil, but were soon afterwards obliged to abandon the acquisitions they had made. In the interior the religious dissensions began to revive. Henry prince of Orange was thought to be less rigid towards the Arminians, in other words, more favourable to them, than suited the principles of the Gomarists. This caused such a commotion as threatened a civil war, which was only prevented by the necessity of union against the common enemy. The Dutch fleet had joined that of France, with which power they were in alliance; and this united force was attacked by the ships of the French Protestants under Soubise. They were defeated, and the Dutch admiral's ship was blown up, with himself and his crew. This caused the greatest joy among the common people in Holland, who detested the conduct of their chiefs; and in the city of Amsterdam their houses were pillaged, and their persons grossly insulted.

The threatening appearance of the thirty years' war in Germany induced the states to increase their land forces in 1626; but during that and the following year only indecisive operations occurred, as the imperial general, Tilly, did not make the expected attack on their frontier towns. The Spaniards made Dunkirk the place for collecting a great number of privateers, by which the Dutch commerce was much annoyed, and many bankruptcies occasioned amongst the merchants of Amsterdam. This induced the Dutch to blockade that port so closely that the system was checked, and in 1628 their East and West India fleets all arrived in safety, loaded with valuable cargoes belonging to the two great commercial companies which had grown up in Holland.

During the same year the fleets of Holland were remarkably successful against Spain. Peter Adrien captured twelve of the largest West Indiamen in the Bay of Honduras. Admiral Heine had still greater success, having a larger force, and in the Bay of All Saints captured so many ships laden with sugar, that the quantity, when brought to Holland, lowered the price of that commodity in all parts of Europe. He then with thirty ships intercepted the Spanish plate fleet, and, after ravaging the coasts of Spain and Portugal, returned with prizes valued at more than fifteen millions of livres. But the state of Holland was far from being tranquil. Fresh umbrage was taken by the populace at the Prince of Orange, because he had appointed some of the Arminians as magistrates, and the people of Amsterdam refused to obey them. This, with tumults amongst the seamen on account of the inadequate distribution of the prize money, caused serious commotions, which were with difficulty and some sacrifices of life put down.

The successes of the Dutch at sea had a favourable influence on the land operations of the following year. Want of pay had produced mutiny in the Spanish army. The Dutch vigour was again awakened, and the Prince of Orange furnished with a powerful army. An active campaign, in which Turenne, Montecuculli, and some other of the most celebrated warriors of the age, bore a part, was closed, by the capture of Bois-le-Duc on one side, and of Wesel on the other frontier of Holland, in spite of all the efforts of the Spaniards to raise the sieges of these places. In the year 1630 the Spaniards renewed their efforts to defend the places they held on the German frontier, but were so unfortunate that, after fruitless attempts to organise a German Catholic confederacy against Holland, they were induced to enter into a negotiation for the conclusion of a truce during thirty-four years. But this negotiation was rendered ineffectual, principally by the intrigues and the influence of the French minister Richelieu, who had by this time formed a strong party in Holland, in opposition to that of the Prince of Orange; a party which continued up to the present age, and to the existence of which may be attributed the enmity displayed by the successive heads of that family to the French government. After the rupture of the negotiations, John of Nassau, with a force, aided by some of the German Catholic princes, of troops and water craft, made the attempt to separate Zealand from Holland. The expedition was met by the Dutch gun-boats; a terrible conflict ensued; the Spanish flotilla was either sunk or captured; and 5000 men were made prisoners, who entered immediately into the service of Holland. This blow was followed up by the Prince of Orange, with his whole force, augmented by the junction of 12,000 Swedes of the army of Gustavus Adolphus, with whom the states had made a treaty, by an attack upon Maestricht, which at length capitulated, as did also the fortified city of Rheneberg on the Rhine, by which Holland became secure from all invasion on the side of Germany. At this time attempts were again made towards negotiation; but the interference of the Austrian general Pappenheim, who had garrisoned some of the towns belonging to Spain, prevented, by his claims, any treaty from being brought to a pacific conclusion.

The Dutch army for the campaign of 1633 was more powerful than at any former period, and was thought sufficiently strong to have completed, with a general of such talents as the prince, the entire conquest of Spanish Brabant. He took the field for that purpose, but the excessive rains of that season, the great inundations, the sickness which prevailed in the army, the scarcity of provisions, and other inconveniences, compelled him to put his army into winter-quarters at a very early period, without having effected or scarcely attempted any object of importance. The year 1634 passed over with no memorable displays of hostile movements. The death of Gustavus Adolphus in the midst of the vast operations in Germany, of which he was the animating soul, caused so many and various negotiations, that the whole of Europe had its attention directed to diplomatic discussions. The war between the Spaniards and the Dutch languished in the Netherlands, though it was carried on at sea much to the benefit of the latter party. In this year, 1635, a partition treaty was entered into with France by the states, contrary to the will of the Prince of Orange, and their ally the king of England, by which the provinces of Luxembourg, Namur, Courtray, Hainault, Artois, and Flanders, were to be transferred to the king of France, and those of Brabant, Guelderland, and the districts of Waes, Mechlin, and the rest of Flanders, to the United States. In pursuance of the objects of this treaty, the fleets of France and Holland were united together; but preparations from England to place her marine in opposition induced them to return to their respective ports. The attempts by land were equally ineffectual. France marched an army of 20,000 foot and 7000 horse into Brabant, and the states had equipped one of nearly equal force. These united troops were to be commanded by the Prince of Orange; but whether that commander, from being averse to the service, neglected to accomplish its objects, or whether the arrogance and barbarities of the French disgusted their allies, such dissensions arose between the officers, that no movements proved beneficial, and the campaign was closed at an early period. The Dutch withdrew to their own country, and the French went into winter-quarters at Ruremond, where it is said more than 6000 of them died, from want and disease. Cardinal Richelieu and the Prince of Orange cherished a mutual animosity, which, though it neutralised their land operations, did not cause a rupture of the alliance that had been formed. The Dutch were successful by sea, where they defeated a Spanish squadron near Dunkirk; and having blockaded that port, secured a safe return to their numerous trading ships from the East and West Indies. In the same year they fitted out an expedition, with the design of extending their power in Brazil. This force, under the command of Prince Maurice of Nassau, consisted of thirty-two ships, with 2700 land forces, and arrived safely at its destination.

The year 1637 was distinguished by the efforts made to capture Breda, which was occupied by a Spanish force under Fourben, a brave and skilful officer. It was invested by the Prince of Orange, and several attempts to relieve it failed, so that after a long siege it capitulated, but not till the beginning of the year 1638. In that year a great project was formed by the Prince of Orange for the capture of Antwerp. It was well designed, but failed from unforeseen circumstances, such as often occur in operations combined of marine and of land forces.

The campaign of 1639 was planned by the Spaniards on a gigantic scheme, but was chiefly directed to naval objects. The Dutch admiral Van Tromp attacked a squadron of ten large men of war, near Gravelines, on the 18th of February. The fight was long and obstinate, but ended in the total defeat of the Spaniards. Their admiral, with three of the largest ships, was taken prisoner; the vice-admiral's ship was burned by the crew, and four of his division were captured; and their loss in men exceeded 2000. Notwithstanding this disaster, the Spaniards equipped a tremendous force under the command of D'Oquendo, consisting of eighty-seven large ships and numerous transports, with 20,000 land forces on board. A junction was formed of the two divisions, one from Cadiz and the other from Corunna. Van Tromp met and engaged this force, sunk the ship which bore the admiral's flag, and took four of the others, but was prevented by a fog from following up his success, whilst from the same cause the Spaniards took refuge in the Downs, where there was an English fleet to protect them. Van Tromp having received reinforcements under Evertzen, and, along with these, orders to renew the battle, desired the English fleet to withdraw; intimating, that if that request was not complied with, his orders were to fight both. Pennington, the English admiral, had doubts of the fidelity of his people, and no confidence in the Spaniards, who were ill disciplined and badly equipped. He therefore declared for a neutrality, but stated that he would join the fleet which should be attacked. D'Oquendo had been advised to withdraw, but it was no longer in his power to do so. Pennington, under pretence that the Spaniards had violated the neutrality, withdrew his protection. Van Tromp then began the attack, and the Spaniards were totally defeated. Fourteen Spanish ships of war were destroyed, amongst which was the Teresa of a hundred guns, with eight hundred men. The vice-admiral of Spain and the admiral of Galicia shared the same fate; sixteen large ships were taken, with 4500 prisoners; fourteen were wrecked between Boulogne and Calais, and the remainder were saved by the interposition of the English. Of the whole armament, only eight ships under D'Oquendo reached Dunkirk in safety. The Spanish loss in killed exceeded 8000 men. Whilst these naval triumphs were achieving in Europe, the Dutch were equally successful in the operations against the Spaniards in Brazil. Their admiral Count de la Torre had been dispatched from Spain with forty-six large ships and a numerous body of troops, many of whom died on the passage, and the others arrived in a sickly state. The Dutch fleet consisted only of forty-one ships, mostly inferior in size to those of their adversaries, but well disciplined, and commanded by two admirals of great bravery and skill, Loof and Huggins. The Spanish fleet previously in Brazil joined that under De la Torre, and they thus amounted to ninety-four ships. An action took place which lasted during several days. Loof was killed at the commencement, but Huggins at length gained a complete victory, in which the Spaniards lost twelve of their largest ships, and 4000 men, whilst the casualties in the Dutch fleet did not exceed one hundred. Disease still further reduced the Spanish force, and thus left Prince Maurice nearly master of that country. The prince then accomplished the conquest of Maranham, and despatched an expedition to the shores of Africa under Admiral Jol, who captured Congo, the island of St Thomas, and the other establishments which the Portuguese had formed on that coast.

At this period Portugal revolted from Spain, and, under the house of Braganza, declared itself an independent kingdom. The new king, John IV., concluded with the Dutch a treaty for a truce of ten years, in all the dominions of both countries, which, however, the latter are accused of having disregarded as far as related to Japan, whence they drove away the Portuguese, and secured for themselves the exclusive trade. The narrative of the transactions in Brazil is given in another part of this work, under that article; and, referring to it (vol. v. part i. page 191), we only add that it was finally abandoned by the Dutch in 1654.

The war between the states and their ally the king of France was continued, but with no great vigour. The jealousy of the Prince of Orange was increased by the discovery of the disinclination of Cardinal Mazarin, the successor of Richelieu, to his capture of Antwerp. He succeeded however in taking Hulst and Lillo, and thus secured a powerful barrier on the Flanders frontier. The negotiations for a general pacification were begun in 1642, and did not close till October 1648, when the celebrated treaty of Westphalia was signed at Munster and Osnaburg. In the first of these years, the treaty between France and Holland was renewed, but was scarcely in activity, as all the military operations of the several powers were in some measure, though not wholly, suspended, except that the Dutch availed themselves of the naval superiority they had acquired, by annoying the Spaniards in every quarter of the world.

Towards the close of the negotiations in Westphalia, the Prince of Orange died, in his sixty-seventh year, and was succeeded in his dignities by his son, William II. The states, regardless of their engagements with France, and in spite of the obstacles interposed by the French ambassador at Munster, entered into a separate treaty with Spain. This treaty was speedily ratified, and its terms formed a part of the general pacification of Europe. The king of Spain acknowledged the independence and sovereignty of the states, and a clause of *uti possidetis* in all parts of the world formed one of the articles. From the peace of Westphalia, the transactions of the United States, whose independence it had legalized, were so intermingled with those of the other European powers, that they form part of the general history of Europe. In continuing this narrative, many of the events which regarded the country here treated of, though important in themselves, must be slightly passed over, because they are to be found under the heads of ENGLAND, EUROPE, FRANCE, and GERMANY.

The conclusion of hostilities had found the nation in a condition of great poverty as related to the governments of the several states, but of great wealth as regarded numerous individuals. The states were deeply in debt, but their creditors were almost exclusively citizens, not to say subjects of the country. This produced what has been called the funding system, which has since been followed by other nations.

Disputes had arisen between the states of Holland on one hand, and the Prince of Orange and the smaller states on the other, respecting the diminution of the army and navy, and the conduct of the officers who had abandoned Brazil. These controversies were carried to such a height that the Prince of Orange would have besieged Amsterdam, towards which he had actually advanced, if he had not been prevented by the opening of the sluices, by which his army would have been drowned. This excited against the prince great unpopularity, when he was carried off by the small-pox, in the twenty-fourth year of his age, leaving no son, but his wife pregnant, who was delivered of a son, afterwards William III. king of England. The civil wars of England were favourable to the trade of the Dutch, though it involved them in war with the government which succeeded the death of Charles I. The several parties in Holland had carefully watched to maintain a neutrality between the monarchical and republican parties in England; but the intemperance of the royalist emigrants, displayed in the murder of Dorislaus, who had been accused of participation in the legal murder of Charles, and of some other rash proceedings, gave the republicans a pretext for commencing hostilities. This led to a naval battle in 1652, when Blake gained some advantage over Van Tromp, though his fleet was much inferior, at least in number of ships, if not in weight of metal. The Dutch instantly fitted out a still larger fleet under the command of De Ruyter, which was met by the English channel fleet under Sir George Ascough. They fought during three successive days, but parted, each claiming a victory. De Witt was then appointed commander in chief of the Dutch fleet, with De Ruyter as his second. Blake, who had sailed to the north after his former battle, collected his ships, and was reinforced by Admirals Penn and Bourn with their squadrons. The two fleets engaged on the 30th of October. The battle was most resolutely contested, but night terminated it before it was decided, and the next day the Dutch entered Goree, declining farther conflict. The fleet of Holland was quickly repaired and reinforced, and placed once more under the command of Van Tromp. Blake had not been furnished in as prompt a manner with reinforcements as his antagonist, and was thus inferior. A tremendous encounter took place on the 25th of November, in which the Dutch were victorious. In this action Blake's flag-ship was disabled, two others were taken, two burned, and one sunk, whilst Van Tromp lost but one of his ships, which was blown up by accident. The engagement lasted from eleven in the morning till six in the evening, when darkness favoured the escape of the shattered remains of the English armament.
